

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

KEY TO PRONUNCIATION.

a	as in ale, fate. Also see ä , below.	d	as in the Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then, this.
ä	senate, chaotic. Also see ä , below.	g	go, get.
ä	glare, care.	g	the German Landtag, and <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
ä	am, at.		
ä	arm, father.		
ä	ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> (ü).	h	as <i>j</i> in the Spanish Jijona, <i>g</i> in the Spanish gila; where it is a fricative somewhat resembling the sound of <i>h</i> in English hue or <i>y</i> in yet, but stronger.
ä	final, regal, where it is of a neutral or obscure quality.	hw	<i>wh</i> in which.
a	all, fall.	k	<i>ch</i> in the German ich, Albrecht, and <i>g</i> in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in hue, or <i>y</i> in yet; or the sound made by beginning to pronounce a <i>k</i> , but not completing the stoppage of the breath. The character <i>k</i> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as <i>of kh</i> in the word Khan.
ä	eve.		
ä	elate, evade.	n	as in sinker, longer.
ä	end, pet. The characters ä , ä , and ä are used for ä in German, as in Gärtner, Gräfe, Hähnel, to the values of which they are the nearest English vowel sounds. The sound of Swedish ä is also indicated by ä .	ng	sing, long.
ä	fern, her, and as <i>i</i> in sir. Also for ä , oe , in German, as in Göthe, Goethe, Ortel, Oertel, and for eu and oew in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.	n	the French bon, Bourbon, and <i>m</i> in the French Etampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce 'onion' without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>n</i> , as in the case of São Antão.
ä	agency, judgment, where it is of a neutral or obscure quality.		
i	ice, quiet.	sh	shine, shut.
i	quiescent.	th	thrust, thin.
i	ill, fit.	th	then, this.
ö	old, sober.	zh	as <i>z</i> in azure, and <i>s</i> in pleasure.
ö	obey, sobriety.		An apostrophe [<i>'</i>] is sometimes used to denote a glide or neutral connecting vowel, as in <i>tä'b'l</i> (table), <i>käz'm</i> (chasm).
ö	orb, nor.		Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
ö	odd, forest, not.		When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.
o	atom, carol, where it has a neutral or obscure quality.		
oi	oil, boil, and for eu in German, as in Feuerbach.		
oo	food, fool, and ap u in rude, rule.		
ou	house, mouse.		
ü	use, mule.		
ü	unite.		
ü	cut, but.		
ü	full, put, or as oo in foot, book. Also for ü in German, as in München, Müller, and u in French, as in Buchez, Budé; to which it is the nearest English vowel sound.		
ü	urn, burn.		
y	yet, yield.		
ü	the Spanish Habana, Cordoba, where it is like a <i>o</i> made with the lips alone, instead of with the teeth and lips.		
ch	chair, cheese.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

MORGAN CITY. A city and port of entry in Saint Mary Parish, La., about 75 miles west by south of New Orleans, on the Southern Pacific Railroad. It is on the Atchafalaya Bayou, navigable for vessels of light draught, which extends from Grand Lake to the Gulf of Mexico, 20 miles distant; has regular steamship communication with important Gulf ports, and has extensive sugar, fish and oyster, and truck gardening interests. The city contains an interesting geological and botanical garden in Oneonta Park. Morgan City was formerly known as Brashear City. Here, on June 23, 1863, Richard Taylor, with about 3000 Confederates, captured the Federal garrison of about 1000, secured property worth about \$2,000,000, and recaptured a large number of refugee blacks. Brashear was soon afterwards abandoned by the Confederates and reoccupied by the Federals. Population, in 1890, 2291; in 1900, 2332.

MORGANFIELD. A city and the county-seat of Union County, Ky., 25 miles southwest of Henderson, on the Illinois Central Railroad (Map: Kentucky, D 3). It has tobacco stemmeries, and manufactories of carriages and wagons, brick, flour, etc. Saint Vincent's Academy (Roman Catholic) is here. The water-works are owned and operated by the city. Population, in 1890, 1094; in 1900, 2046.

MORGANTE MAGGIORE, mór-gán'tá má-jó'rá, L. A metrical romance by Luigi Pulci (q.v.).

MORGANTON. A town and the county-seat of Burke County, N. C., 79 miles west of Salisbury, on the Southern Railroad (Map: North Carolina, A 2). It is the seat of the State Hospital for the Insane and of the North Carolina School for the Deaf and Dumb, and has considerable reputation as a health resort. Among the principal manufactories are cotton mills, tanneries, lumber mills, and machine shops. There are gold deposits in the vicinity. Population, in 1890, 1557; in 1900, 1938.

MORGANTOWN. A city and the county-seat of Monongalia County, W. Va., 102 miles south of Pittsburg, Pa., on the Monongahela River, which is navigable to this point, and on

the Baltimore and Ohio Railroad (Map: West Virginia, E 2). It has a fine court house, and is the seat of the West Virginia University (q.v.), established in 1868. There are glass works, furniture factories, woolen, planing, and flour mills, and brick and tile works. The city is in a rich agricultural, timber, natural gas, and mineral country—coal, iron, limestone, clay, and glass sand being found in paying quantities. Population, in 1890, 1011; in 1900, 1895.

MORGARTEN, mór'gär-ten. A mountain slope on the boundary of the cantons of Schwytz and Zug, Switzerland, celebrated as the scene of a great victory won by the Swiss forest cantons over a numerically superior force of Austrians, November 15, 1315. In January, 1314, the farmers of Schwytz had seized the Abbey of Einsiedeln, robbed it of its treasures, and driven out the monks. Frederick the Fair, head of the House of Hapsburg, who was the protector of Einsiedeln, ordered his brother, Duke Leopold, to punish the guilty ones. The battle was the result.

MORGEN, mór'gen, KUET (1858—). A German soldier and explorer, born at Neisse (Silesia), Prussia. He was educated for the army at Wahlstatt and Berlin, and in 1889 took charge of an expedition for the exploration of Kamerun. On November 5 he left Kribi on the coast of Batanga. He discovered the Mbam River, the principal tributary of the Sanaga, and proceeded along the Sanaga as far as Malimba. On June 2, 1890, he again set out from Kribi. During this second expedition he penetrated to Tabati, and thence to Ibi on the Benue, from which point he descended the river to Akassa, on the coast. In 1896-97 he fought with the English army against the Mahdi, and in the latter year witnessed the Græco-Turkish War from the headquarters of the Ottoman army. He attained the rank of major in 1898.

MORGENSTERN, mór'gen-störn, CHRISTIAN (1805-67). A German landscape painter, born in Hamburg. He studied in his native city and at the Academy of Copenhagen, settled in 1830 at Munich, and acquired a reputation with his romantic views of the Bavarian and Aus-

trian Alps. From a later period date the moonlight and storm scenes which constitute the most admired portion of his work, representative examples of which are a "Mill in Sainte Marie Valley, Alsace" (1836, Hamburg Gallery); "April Day on Lake Starnberg" (1853, Leipzig Museum); "Storm at Sea" (1839) and "Alsatian Landscape" (both in New Pinakothek, Munich).

MORGENSTERN, LINA (BAUER) (1830—). A German philanthropist and author, born in Breslau. In 1854 she removed to Berlin, where she became prominent as a reformer. She was interested in the formation of 'people's kitchens,' of technical and domestic schools for women, and of schools for the reform of wayward young girls. She edited *Deutsche Hausfrauenzeitung* (1874 sqq.) and *Für junge Mädchen* (1888-94), and wrote *Friedrich Fröbel* (1882), *Die Frauen des neunzehnten Jahrhunderts* (1888), and *Frauenarbeit in Deutschland* (1893).

MORGES, mörzh. A town in the Canton of Vaud, Switzerland, about six miles west of Lausanne, on Lake Geneva and on a branch of the Jura-Simplon railway (Map: Switzerland, A 2). There are Reformed and Catholic churches, a college with a Realschule, a casino with a library and a museum of natural history, and a high school for girls. The town contains an old château (twelfth century), once the seat of the Bernese governors and now used as an arsenal, and nearby is the château of Vuflens, said to have been erected by Queen Bertha of Swabia. Population, in 1900, 4438, of whom about 500 were Roman Catholics.

MORGHEN, mör'gën, RAFFAELLO (1758-1833). An Italian line engraver. He was born at Florence, June 19, 1758, the son and pupil of Filippo Morghen, and was also instructed by his uncle, Giovanni Elia Morghen. When twelve years old he engraved a good plate after the "Prophets" of Bandinelli, and at twenty he showed remarkable proficiency. He studied at Rome under Volpato, whose daughter he married in 1781. In the same year he engraved Raphael's "Poetry" and "Theology," then worked in conjunction with his father-in-law, assisting him in his "Parnassus," after Raphael. He was appointed professor at the Academy in Florence in 1793, became a member of the French Institute in 1803, and visited Paris in 1812, at the invitation of Napoleon, who conferred many honors upon him. His best known works include the "Aurora," after Guido Reni; the "Mass of Bolsena," "Madonna della Sedia," and "Transfiguration," after Raphael; "Diana Hunting," after Domenichino; the "Madonna del Sacco," after Andrea del Sarto; the "Dance of the Seasons," after Poussin; and the "Last Supper," after Leonardo, generally considered his masterpiece. Of high finish and special interest are also his portraits of Dante, Petrarch, Boccaccio, Ariosto, Tasso, Alfieri, Raphael, etc. He died in Florence, April 8, 1833. His life and all his works, comprising 252 plates, have been fully described by his pupil Palmerini, in *Catalogo delle opere d'intaglio di Raffaello Morghen* (Florence, 1824).

MOR'GIA'NA. A female slave, belonging to Cassius and then to his brother, in "Ali Baba and the Forty Thieves," a story in the *Arabian*

Nights Entertainments. She outwitted the thieves in their attempts to find the discoverer of their cave first by duplicating their mark on Ali's house, then by scalding the Forty with hot oil in the jars in which they were smuggled into the house; and at last, when the captain, disguised as a merchant, dined with Ali, she first danced for him and then stabbed him with his own dagger. Ali freed her and married her to his son.

MORGUE (Fr., originally the inner wicket of a prison, where prisoners were kept for some time, that the jailers and turnkeys might view them at their leisure, so as to be able to recognize them when occasion required, from *morguer*, to look at solemnly or sourly, to defy). The name of a certain building in Paris, situated on the *Quai du Marché neuf*, where the dead bodies of persons unknown, found either in the river (Seine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on a sloping slab of black marble. The clothes are hung on the wall above. When a corpse is recognized it is handed over to the relatives or friends of the deceased, on payment of costs and dues—otherwise it is interred at the expense of the city. The number of bodies yearly exposed in the *Morgue* is about 300, of which five-sixths are those of males. Morgues have been established in Berlin and in the principal American cities; in New York in 1866, in Boston in 1851, in Brooklyn in 1870, in Chicago in 1872, in Saint Louis in 1874.

MORHOF, mör'hōf, DANIEL GEORG (1839-91). A German literary historian, born at Wismar. He studied law and the humanities at Rostock, where in 1860 he became professor of poetry. In 1865 he was called to the chair of oratory and poetry at Kiel and in 1873 became also professor of history and in 1880 librarian. His *Opera Poetica* (1877) and *Deutsche Gedichte* (1882) are valueless, but his two prose works, *Unterricht von der Deutschen Sprache und Poesie* (1882) and *Polyhistor* (1888) are of considerable interest in the history of literature. The former contains perhaps the first historical treatment of German grammar and a review of what was then modern European literature. The *Polyhistor*, which deals with general literature and is encyclopædic in scope, marks the first systematic study in Germany of the history of literature.

MORI, mō'rē. The name of the Lords of Choshu in Japan. The chief of the clan was foremost in the anti-foreign agitation which sought to close Japan again to the world (1858-67), after the demand for admission made by Commodore Perry, and in 1863 became known through his action in firing upon Dutch and American merchantmen passing through the Straits of Shimonoseki. In consequence, a squadron was formed and the town of Shimonoseki was bombarded. This helped to convince the Japanese that resistance was impossible and that the ancient policy of seclusion must be reversed. Mori continued the agitation, however, directing it against the Government of the *Shogun*, and was one of the chief factors in the restoration of the Emperor to supreme power. Since the revolution of 1868, the clansmen of Choshu have been highly influential in the Government, and as active in

the adoption of Western civilization as they had been previously in opposition to its introduction.

MORI, mō'rē, ARINORI (1848-89). A native of Satsuma, Japan, and one of the group of young samurai who were prominent in advocating the thorough modernization of the Empire after the restoration of the Emperor. Educated in England, he adopted modern manners in life and thought, and broke completely with the past. He held various high positions in the diplomatic and civil services, and became finally Minister of Education. He was raised to the peerage in 1889, with the title viscount. When the Constitution of Japan was promulgated, giving the Empire its place among progressive peoples, he was assassinated in his own house by a Shinto fanatic, who charged him with violating the sanctity of the shrine in Ise by lifting the curtain before the holy place with his cane.

MORI'AH. The name of the land whither Abraham was commanded to go to sacrifice his son Isaac upon a mountain, according to Gen. xxii. 2, and of the mountain upon which Solomon built the temple, according to II. Chron. iii. 1. It is possible that the chronicler understood the passage in Genesis as affirming that Abraham's sacrifice was made in Jerusalem. He no doubt found 'the mountain of Moriah' as a designation of Zion, and it may already in his time have been popularly interpreted to mean 'the mountain of vision,' as it was by the Samaritan translator, Symmachus, and by Jerome. Originally it may have been pronounced *moreh Yah* and signified 'Yahweh is an oracle-giver,' or 'the Moriah' may have meant 'the oracle.' How old this name of the temple-mountain is cannot be determined. The Elohist in Gen. xxii. 2 refers to one of the mountains 'in the land of Moriah.' This particular shrine is called *Yahweh yireh*, 'Yahweh sees,' or *Yahweh yereh*, 'Yahweh gives oracles.' Bacon and Cheyne look for this sanctuary in the Negeb or Southern Palestine, and Gunkel thinks that it is identical with the Jeruel near Tekoa mentioned in II. Chron. xx. 16, though he admits that the distance from Beersheba does not preclude the identification with Jerusalem, and regards Ariel, a name of Jerusalem, as a corruption of Jeruel. It is possible that *Yahweh yereh* is an explanation of the meaning of Moriah, or that 'the Moriah,' 'the oracle,' is an appellative designation of a sanctuary also known by the kindred name Jeruel. But it is not certain that 'the land of Moriah' in Gen. xxii. 2 has anything to do with this sacred place. The Syriac version suggests that the original reading was 'the land of the Amorites.' 'Amorites' is the name of the pre-Israelitish inhabitants of Palestine used by the Elohist. It corresponded to the Assyrian Amurru or Martu, and the dropping of the prosthetic aleph can be easily accounted for. This explanation has the advantage of being based on very excellent ancient testimony to the pre-Massoretic text. Wellhausen thinks of 'the Hamorites' who lived in Shechem, in the neighborhood of which there was an *elon moreh* or 'sacred tree of the oracle-giver.' It is indeed doubtful whether the Ephraimitish writer would have made Jerusalem the great sanctuary where animal offerings were substituted for human sacrifices, and the change to 'Hamorites' is not necessary, since Shechem certainly was in

the land of the Amorites. From the Jerahmeelite Negeb Shechem might be reached on the third day, though not so easily as Jerusalem. The question of the site of the sacred mountain must therefore be left open. Consult: Dillmann, *Die Genesis* (6th ed., Leipzig, 1892); Gunkel, *Genesis* (Göttingen, 1901); Cheyne, article "Moriah," in *Encyclopædia Biblica*, vol. iii. (London, 1902).

MORIER, mō'rī-ēr, JAMES JUSTINIAN (c.1780-1849). A British diplomat, author, and traveler, born at Smyrna. He was educated at Harrow, and in 1807 became private secretary in Sir Harford Jones's mission to the Persian Court. On May 7, 1809, three months after his arrival at Teheran, he was sent home with dispatches and performed the famous journey of which he afterwards published an account under the title *A Journey Through Persia, Armenia, and Asia Minor to Constantinople in the Years 1808 and 1809* (1812). This book enjoyed a great vogue in Great Britain, and was translated into French (1813) and German (1815). In 1810 he went back to Teheran as Secretary of Legation under Sir Gore Ouseley, and after the latter's return to England in 1814 Morier acted for a time as British representative at the Court of Persia. He was recalled in 1815. In 1817 he was pensioned by the Government, and devoted most of his time thenceforth to literature, in which pursuit he attained such success that Sir Walter Scott styled him the best novelist of the day. His best works are: *The Adventures of Hajji Baba of Ispahan* (1824); *Zohrab the Hostage* (1832); and *Ayesha, the Maid of Kars* (1834).

MORIER, Sir ROBERT BURNETT DAVID (1826-93). An English diplomatist, born in Paris (where his father was consul-general), and educated at Balliol College, Oxford. After holding several other diplomatic offices, he was appointed chargé d'affaires at Stuttgart in 1871, and at Munich in 1872, whence he was transferred to Lisbon as English Minister (1876). When Morier was Ambassador to Saint Petersburg (1884-91) he and Bismarck were bitter enemies, and in 1888 Count Herbert Bismarck charged Morier with furnishing information to Bazaine at the outbreak of the Franco-Prussian War. Time showed that Morier had been innocent, and that French spies had gained the information in question. In 1891 he was transferred to Rome, but was forced by urgent business to remain in Russia.

MÖRIKE, mē'rī-ke, EDUARD (1804-75). A German poet. He was born at Ludwigsburg, and studied theology at Tübingen, where from 1826 to 1843 he served as a clergyman. From 1851 to 1866 he was professor of German literature in a seminary at Stuttgart. One of the most prominent members of the Swabian school, he first appeared in 1832 with the fantastic tale *Maler Nolten* (revised in 1872, third edition 1890), which revealed his imaginative power. His collected *Gedichte* (1838, eleventh edition 1894) are marked not only by the idyllic cast common to the Swabian group, but by a delicate humor and a classical severity of form peculiarly their own. The exquisitely wrought novelette *Mozart auf der Reise nach Prag* (1856) has frequently been accounted his finest achievement. His further work includes the *Idylle vom Bodensee* (1846) and the caprice *Das Stutt-*

garter *Hutzelmännlein* (1855). Many of the poems are to-day established folk-songs. Consult the biographies by Notter (Stuttgart, 1875), Klaiber (ib., 1876), Mayne (ib., 1901), and Fischer (Berlin, 1901).

MÖRIKOFER, mō'ri-kō'fēr, JOHANN KASPAR (1799-1877). A Swiss literary and ecclesiastical historian, born at Frauenfeld. He studied at Zurich, taught in his birthplace, and was pastor at Gottlieben from 1851 to 1869. His historical works have scientific value and literary charm; they include *Die schweizerische Mundart im Verhältnis zur hochdeutschen Schriftsprache* (1838); *Klopstock in Zürich* (1851); *Die schweizerische Litteratur des achtzehnten Jahrhunderts* (1861); *Ulrich Zwingli* (1867-69); and *Geschichte der evangelischen Flüchtlinge in der Schweiz* (1876).

MORILLO, mō-rē'lyō, PABLO, Count of Cartagena and Marquis de la Puerta (1777-1838). A Spanish soldier. He was born in Fuentes de Malsa, in the Province of Toro, and entered the Spanish navy in 1793. During the war against Napoleon he raised a guerrilla corps, at the head of which he soon acquired fame, and became lieutenant-general. In 1815 he was placed in command of 12,000 men and sent to South America to conquer the insurgent provinces of Venezuela and New Granada. He speedily captured Caracas, Cartagena, and Bogotá, but met reverses later and was compelled to sign the armistice of Truxillo with Bolívar (1820). He returned to Spain, joined the Court party, and was believed to be one of the authors of an insurrection of the Guards in 1822. After this he went over to the patriots, obtained command of an army corps, changed back again, and submitted to the French (1823). Exiled by Ferdinand, he was recalled in 1832 and led an army against the Carlists. He published his *Mémoires* at Paris in 1826.

MORIN, mō-rān', ARTHUR JULES (1755-1880). A French mathematician, born in Paris. He studied at the Ecole Polytechnique and at the Ecole d'Application in Metz, and in 1819 was commissioned lieutenant in an engineer battalion. He was professor at the Conservatoire des Arts et Métiers, and after 1847 its director. He devoted his attention to mechanics, and by his researches and inventions contributed materially to the progress of that science. The results of his labors are embodied in memoirs which he contributed to the *Comptes rendus de l'Académie des sciences de Paris*, and in a number of separate publications, among which are: *Aide-mémoire de mécanique pratique* (1838); *Salubrité des habitations* (2d ed. 1874); and *Fundamental Ideas of Mechanics and Experimental Data*, . . . translated by J. Bennet (New York, 1860).

MORIN, mō-rēn', ENRICO CONSTANTINO (1841—). An Italian naval officer and statesman, born in Genoa. He rose through successive grades to that of vice-admiral (1893). In 1886 he was elected from Florence to the Chamber of Deputies, from 1888 to 1891 was Under-Secretary of State in the Ministry of Marine, in which post he urged an increase of the navy, and from 1893 to 1896 was Minister of Marine. He was appointed Senator in 1900, and in the same year again became Minister of Marine.

MORINUS, mō-rē'nū', JOHANNES, or JEAN MORIN (1591-1695). A French Catholic theo-

gian and Orientalist, born at Blois of Protestant parents. He was educated at Leyden and at Paris, where he entered the Catholic Church, and in 1618 joined the Oratorians. He was head of the College of Angers, and in 1640 was summoned to Rome by Urban VIII. to assist in discussing the union of the Eastern and Western churches. He was suddenly recalled by Richelieu, who possibly feared that Morin would speak ill of him at Rome. Besides his works on Church history, and more important, Morin wrote on text criticism: *Exercitationes Ecclesiasticæ et Biblicæ* (1686, containing two earlier works of 1631 and 1639), which urges the priority and superiority of the Samaritan Pentateuch; *Opuscula Hebræo-Samaritica* (1657), with grammar and lexicon; and in Le Jay's *Polyglotte*, an edition of the Samaritan Pentateuch.

MORIOKA, mō-rē-ō'ka. The capital of the Prefecture of Iwate, Japan, situated in a mountainous district in the northern part of Hondo, about 40 miles from the coast (Map: Japan, G 4). It is celebrated for its kettles, silk goods, fruits, and vegetables. Population, in 1898, 32,989.

MORIORI, mō-rē-ō'rē. The aborigines of the Chatham Islands, linguistically and somatically close kinsmen of the Maori (q.v.). Their crania are distinctly more Polynesian than Melanesian, and some authorities see traces of race mixture in certain osteological peculiarities. Some anthropologists regard the Moriori as only a branch of the Maori, who reached the Chatham Islands before tattooing had come into general use or the carving and ornamentation of the New Zealand Maori had taken on their characteristic development. Tradition, supported by other indications, suggests two migrations to these islands, one before and the other after Maori art had become matured. The flat stone clubs of the Chatham Islanders are supposed to go back to the dark people who preceded them. The best stone axes of the Moriori exceed in fineness of polish those of the Maori. The general conclusion is that the culture of the Chatham Islanders is an outspur of that of New Zealand. Such marked peculiarities as exist are due to the poverty and limitations of the group. The influence of the antecedent 'dark race' is more marked there than in New Zealand itself. In 1831 they are said to have numbered 1200 to 1500; but the inroads of Maori from the Taranaki District of New Zealand in 1832-35 led almost to their extermination, and there were but 200 left in 1868. In 1889 the islands were reported to contain 27 pure-blooded Moriori, 5 half-bloods, 250 Maori, and a few Europeans. In 1896 their number was estimated at 30 to 50; but Schauinsland, who visited them in 1897, thought it not over 16 to 25.

MORISCOS, mō-rē'skōs (Sp., Moorish men). The name given in Spain after 1492 to those Moors who through intimidation or force were brought over to Christianity. See MOORS; SPAIN.

MORISON, JAMES (1816-93). A Scotch clergyman, founder of the Evangelical Union. He was born at Bathgate, Linlithgowshire, February 14, 1816. He was educated at Edinburgh, and licensed to preach as a minister of the United Secession Church in 1839. In 1841 he was deposed for holding and advocating 'universal atonement.' With three other ministers of like

views and their followers, he formed the Evangelical Union (q.v.). At the same time he established a theological academy, of which he continued principal till his death. He was pastor first of Kilmarnock, and from 1853 to 1884 in Glasgow, where he died, November 13, 1893. Consult his *Life* by A. Adamson (London, 1898).

MORISON, JAMES AUGUSTUS COTTEE (1832-88). An English author, born in London. His childhood was spent in Paris (1834-40), and he gained an intimate knowledge of French. An Oxford graduate (1859), he wrote for the *Saturday Review*, and in 1863 brought out a *Life of Saint Bernard*, followed by sketches of *Gibbon* (1878), *Macaulay* (1882), and *Mme. de Maintenon* (1885), while his last work, *The Service of Man: An Essay Towards the Religion of the Future* (1886), was the outcome of his Positivist beliefs. Morison was a founder and joint owner of the *Fortnightly Review*.

MORISON, ROBERT (1620-83). A British botanist, born at Aberdeen. He graduated at the university of his native city in 1638, but the next year, having taken up arms in the Royalist cause, he was compelled to flee to France. There he studied anatomy, zoölogy, botany, mineralogy, and chemistry, and in 1648 took the degree of M.D. at Angers. A year or two later Gaston, Duke of Orleans, appointed him one of his physicians, a position which he held until the Duke's death in 1660, and in which he made such a reputation that after the Restoration Charles II. appointed him his senior physician, King's botanist, and superintendent of all the royal gardens. In 1669 he became professor of botany at Oxford. His great service to botany was in classification, in which connection Franchet says of him that his works make an epoch in botanical literature. Among these are: *Præiudicia Botanica* (1669); *Plantarum Umbelliferarum Distributio Nova* (1672); and *Plantarum Historiæ Universalis Ozoniensis, Pars Secunda* (1680). Consult: Pulteney, *Sketches of the Progress of Botany* (London, 1790); Tournefort, *Éléments de botanique* (Lyons, 1797; in Latin, Paris, 1700); and Franchet, *Flore de Loir-et-Cher*.

MORITZ, mō'rīts, KARL PHILIPP (1756-93). A German author, prominent in the Sturm-und-Drang period. He was born at Hameln, of poor parents. He taught for a short time at Dessau (1777), then at a military orphanage at Potsdam (1778), and soon after in Berlin. In 1786 he went to Italy, and in Rome became acquainted with Goethe, who recommended him to Duke Karl August, by whose influence Moritz was elected to the Berlin Academy, and in 1789 became professor of antiquities in the Academy of Art in Berlin. His adventurous life can to a great degree be reconstructed from the semi-biographical novels, *Anton Reiser* (1785-90) and *Andreas Hartknopf* (1786). He wrote, besides: *Versuch einer deutschen Prosodie* (1786); *Ueber die bildende Nachahmung des Schönen* (1788); *Götterlehre* (1791); *Reisen eines Deutschen in England* (1783); and *Reisen eines Deutschen in Italien* (1792-93). Consult Dessoir, *Moritz als Aesthetiker* (Berlin, 1889).

MORLACCHI, mōr-lāk'kē, FRANCESCO (1784-1841). An Italian composer, famous for his advanced style of composition, which has been described as a classical blending of Italian vi-

vacuity and methods with German contrapuntal profundity. He studied under Mazzetti, Caruso, Padre, Martini, and Zingarelli. His compositions include a coronation cantata, considerable church music, organ pieces, songs, chamber music, masses, and grand operas. In 1810 he became kapellmeister of the Italian opera at Dresden, where he is said to have composed his best work. His oratorios, *Isacco* (1817) and *La morte di Abele* (1821), are representative. He died at Innsbruck.

MORLAIX, mōr'lā'. The capital of an arrondissement and a seaport in the Department of Finistère, France, on the estuary of the Dossen, 6½ miles from the sea, and 38 miles east-northeast of Brest (Map: France, C 3). The estuary is spanned by a fine railway viaduct 934 feet long and 190 feet high. The town has a mediæval aspect, with its fifteenth-century church of Saint Melaïne, its narrow winding streets, and its quaintly gabled timbered houses. The port is accessible to ships of 400 tons burden. A considerable coastwise trade is carried on in horses, agricultural produce, leather, and paper. The industrial establishments include paper mills and an important Government tobacco factory. Population, in 1900, 16,086. Morlaix dates from the Roman occupation. In 1187 it was besieged and captured by Henry II. of England. In 1522 it was taken by the troops of Henry VIII. of England, but recaptured by the French in a night attack, when 600 Englishmen were killed.

MORLAKS. A Slavonic people belonging to the southern branch, and living along the coast of Dalmatia, Austria-Hungary. They settled in this locality during the great southern migration of the Serbs from the Carpathian region in the sixth and seventh centuries. They are a hardy, seafaring people, who furnish the best material for the Austrian Navy, and are prominent in the commerce of the Adriatic. They are generally classed with the Dalmatians. See DALMATIA.

MORLAND, GEORGE (1763-1804). An English genre, animal, and landscape painter, born in London. He inherited talent from his father, Henry Morland (1712-97), painter, engraver, and picture dealer, who gave him a good training. At sixteen he exhibited at the Royal Academy, and at seventeen he had attained a reputation as a copyist, especially of the Dutch and Flemish masters. After a rupture with his father he set up on his own account in 1784 or 1785, and dashed into a career of dissipation and prodigality, supporting himself by the sale of his pictures, painted with marvelous rapidity and cleverness. He lived with a picture dealer, and became the companion of hostlers, pot-boys, jockeys, pawnbrokers, and pugilists. In 1786 he married the sister of the engraver William Ward, and for a time reformed. At this period he painted many moralities in the style of Hogarth; but he soon returned to his profligate life, and produced his masterpiece, the "Interior of a Stable" (1791), now in the National Gallery, London. He became popular, and dealers flocked to him. Sometimes he painted two pictures a day, and once a large landscape with six figures in six hours. Every demand for money, tavern score, or bill was paid by a picture worth twice the charge. His subjects were scenes in humble life in town and country—cottages,

stables, inn-yards, pastoral scenes, and domestic animals, especially pigs. Altogether he painted 4000 pictures, 250 of which were engraved. He died in a sponging-house in Holborn, October 27, 1804. His epitaph on himself was, "Here lies a drunken dog." He was generous, good-natured, and industrious despite his faults.

After a period of neglect Morland is now ranked among the best masters of genre and animals, not far below the Dutch artists on whom he modeled his style. He was a fine brushman; his color is rich, and his treatment, if light, is skillful. His representation is realistic and true to life. In the South Kensington Museum are six of his paintings, the best known of which is "The Reckoning." The Museum of Glasgow contains a "River Scene" and three seacoast landscapes. In the New York Historical Society are his "Old English Sportsman" and "Dogs Fighting;" in the Metropolitan Museum, "Mid-day Meal" and "Weary Wayfarers." His auto-portrait is in the National Portrait Gallery, London. Consult: *His Life*, by George Dawe (London, 1807); his *Memoirs*, by Blogdon and Hassel (ib., 1806); William Collins, *Memoirs of a Picture* (London, 1803).

MORLAND, Sir SAMUEL (1625-95). An English diplomat and inventor. He was born in Sulhampstead, Berkshire, and studied at Winchester School and at Magdalene College, Cambridge. His first mission of importance was to the Duke of Savoy in 1655, to protest against the massacre of the Waldensians. Morland brought back with him materials, mostly clumsy forgeries, for a history of this sect, which he published in 1658. After the Restoration Morland received the title of baronet and many empty promises from the King. He devoted himself more and more to the study of mathematics and mechanics, and invented a speaking trumpet and some calculating machines. But his more important work was in hydrostatics, and especially in devising a steam pump.

MORLEY. A municipal borough in the West Riding of Yorkshire, England, four miles south-southwest of Leeds (Map: England, E 3). The new town-hall is a handsome building, and the municipality owns its waterworks, gas and electric lighting plants, maintains public baths, parks, and recreation grounds. It has important manufactures of woollens and mill machinery. There are coal mines and stone quarries. Morley is mentioned in *Domesday*, and in a tax list of Richard II. It was incorporated in 1885. Population, in 1891, 21,000; in 1901, 23,600. Consult Smith, *Morley, Ancient and Modern* (London, 1886).

MORLEY, EDWARD WILLIAMS (1838—). An American chemist, born at Newark, N. J. He graduated from Williams College in 1860, and in 1869 became professor of chemistry at Western Reserve College (afterwards Adelbert College). With this post he also held (1873-88) a chair of chemistry at the Cleveland Medical College. He was associated with A. A. Michelson in researches on the relative motion of ether and matter, and also in the determination of the meter in terms of the wave length of light. He was president of the American Association for the Advancement of Science (1895) and of the American Chemical Society (1899), and was elected a member of the National Academy of

Sciences and associate of the American Academy of Science. In the proceedings of the latter academy for 1880 he first described his valuable apparatus for gas analysis; he also wrote *Atomic Weight of Oxygen* (1895).

MORLEY, HENRY (1822-94). An English author, born in London, September 15, 1822. He was educated at a Moravian school at Neuwied on the Rhine, and at King's College, London (1838-43); practiced medicine at Madeley, in Shropshire (1844-48); and, having been fleeced by a colleague, he started a school on Moravian methods at Manchester, but after two years he started it afresh at Liverpool. A series of ironical essays entitled *How to Make Home Unhealthy* attracted the attention of Dickens, and eventually led to Morley's settling in London and taking a hand in *Household Words* and *All the Year Round* (1850-65). He also became connected with the *Examiner* as sub-editor and then as editor (1856-64). Meanwhile he was appointed lecturer in English at King's College (1857-65), and then professor of English at University College, London (1865-89). He died May 14, 1894. Chief among Morley's works are: *A Defence of Ignorance* (1851), a bit of irony; *Lives of Palissy the Potter* (1852), Jerome Cardan (1854), and Cornelius Agrippa (1856); *Memoirs of Bartholomew Fair* (1857); two volumes of fairy tales (1859-60); *English Writers*, to Dunbar (1864-67), rewritten and brought down to the seventeenth century (11 vols., 1887-95); *A First Sketch of English Literature* (1873; rev. 1886); and *English Literature in the Reign of Victoria* (1881). He also edited a *Library of English Literature* (5 vols., 1875-81); *Universal Library* (63 vols., 1883-88); *Cassell's National Library* (214 vols., 1886-90); and the *Carisbrooke Library*, a series of reprints (14 vols., 1889-91). Though Morley was not a critic and editor of the first rank, he had catholic tastes, a talent for finding the best in things, and he performed a most valuable service in making easily accessible the treasures of English literature.

MORLEY, JOHN (1838—). An English statesman and author, born at Blackburn, in Lancashire, December 24, 1838. Having taken his degree at Lincoln College, Oxford (1859), he went to London to engage in literature. He soon became editor of the *Literary Gazette*, at that time in such a state of decrepitude that Morley, with all his energy and talent, could not quicken it to new life. His writings soon showed the influence of Auguste Comte, and he became known as an agnostic philosopher. From 1868 to 1870 he edited for a little while the daily *Morning Star*. In 1867 he succeeded Lewes as editor of the *Fortnightly Review*, which he conducted brilliantly till 1883, becoming, in that year, editor of *Macmillan's Magazine*. Under his guidance the Macmillans have issued since 1878 the "English Men of Letters Series," to which Morley contributed a short but excellent *Life of Edmund Burke* (1879). His *Burke*, an historical study, appeared in 1867. In 1880 he began ably to edit the *Pall Mall Gazette*; in 1881 he published his *Life of Cobden*; and in 1883, after two failures, he was at a by-election returned to Parliament for Newcastle-upon-Tyne. He soon became prominent, and in 1886 he was made Secretary for Ireland under Gladstone,

thus getting an insight into Gladstonian politics and character to be shown later in his *Life of Gladstone* (1903). Morley sympathized with the Irish Nationalists, but, unlike Gladstone, he was unhampered by pledges and opinions. On the defeat of the Gladstonians in 1886 he was half in politics, half in letters, till Gladstone's return to power restored him to his former office. Morley's anti-imperialistic views helped to lose him his seat in 1895, but he was soon re-elected from the Montrose Burghs, Scotland. In 1898 and afterwards he upheld the Boers. Besides the books already mentioned, Morley is the author of monographs on *Voltaire* (1872), *Rousseau* (1873), one of the most sympathetic biographies ever written, *Diderot and the Encyclopædists* (1878), and *Walpole* (1889). In *Cromwell* (1900) he added something to historical knowledge, though his work is mainly a revision of Gardiner. In 1902 Andrew Carnegie presented to him the rich historical collection of Lord Acton, recently deceased, and Morley in turn presented it to Oxford University.

MORLEY, MRS. The name adopted by Queen Anne in her correspondence with the Duchess of Marlborough. See **FREEMAN, MRS.**

MORLEY, THOMAS (1557-c.1604). An English musician and composer. The place of his birth cannot be definitely fixed, but it is supposed that he was born in London and educated at Saint Paul's Cathedral. According to his own statement he also studied under Bird. In 1588 he became bachelor of music at Oxford and in 1591 was deputy chorister at Saint Paul's, taking his regular turn of duty as organist. In 1592 he was made epistler of the Chapel Royal. He strove hard during his entire career for the advancement of English music, and devoted himself exclusively to the development of vocal music. His principal work and that upon which his reputation is chiefly based was *A Plaine and Easie Introduction to Practicall Musick*, published in 1597. It was the first practical work on music issued in England; was translated into German and published throughout the German States by Trost of Halberstadt about 1600. In England it remained an authority up to so late a period as 1770. He wrote many compositions for the Church, none of them, however, being printed in his lifetime. Tallis's monopoly of music-printing expired in 1596 and two years later Morley obtained a similar one, and under his license "William Barley, Thomas Est, alias Snodham, Peter Short, John Windet, and others," printed several books as the "assigne of Thomas Morley." He resigned from the Chapel Royal in 1602. That he was an excellent musician his ballets and madrigals prove. He was also superior in melodic invention to any of his predecessors, and is generally credited with having disentangled music from the fettered condition in which he found it, and to have broken away from the slavish adherence to the 'Modes' which had characterized other composers. From his time forward composers designedly wrote melodies meant to express the emotional content of the text.

MORMOLUCOIDES (Neo-Lat. nom. pl., from *mormolucas*, glowworm, from Gk. *μормολυκειον*, *mormolykeion*, *μормολυκιον*, hobgoblin, from *μормολυττεσθαι*, *mormolyttesthai*, to frighten, from *μормυς*, *mormos*, bugbear + *ειδος*, *eidos*, form).

The oldest known fossil insect larva, found in the shale of the Newark formation of the Jura-Triassic system in New Jersey, Connecticut, and Massachusetts. In general appearance it resembles the larva of the modern firefly, though it is considerably larger, being quite three-quarters of an inch in length. It is considered to be the young of a neuropteran insect allied to the modern dobsons (*Sialis*).

MORMON CRICKET. Either of the wingless migratory crickets, *Anabrus simplex* and *Anabrus purpureus*. These are large, peculiarly shaped crickets, which occasionally multiply so greatly in their native home in the foothills of the Rocky Mountains that they migrate to the plains below, and destroy all cultivated crops. As they are wingless, they move but slowly, and may often be checked by ditches. A plowed field in their course forms a difficult barrier, and an approaching army may be destroyed by means of heavy rollers. They are pugnacious and will fight among themselves, and are to a certain extent carnivorous, devouring their injured comrades. For many years they have been especially abundant and injurious in portions of Montana and Idaho.

MORMONS, or more properly **THE CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.** A religious sect of the United States. The early history of the Mormons is that of their founder, Joseph Smith, Jr., who was born at Sharon, Windsor County, Vt., December 23, 1805. According to contemporary anti-Mormon descriptions, or to the suppressed accounts of early Mormon apologists, Joseph's paternal grandfather was a man of distorted religious views; his maternal grandfather, Solomon Mack, was an infirm beggar, and superstitious to a high degree. Joseph's mother believed in cures by faith and in dreams as heavenly admonitions. The Prophet's father, after failing as a farmer, a storekeeper, and a root-digger in Vermont and New Hampshire, took up a land claim in Ontario County, N. Y., in 1815. Like his son, he was a confessed believer in witchcraft and demon possession. In his autobiography Smith called these the reports of evil-disposed and designing persons; by the later church historians they are either palliated or deprived of significance; however, to the student of heredity these details of Smith's ancestry are considered essential to a pathological estimate of his character. The Mormons quote, only to refute, the hostile statements that Smith was a visionary, a fanatic, an impostor, and a libertine; instead, they esteem him a prophet, a seer, a vicegerent of God, and a martyr (*Times and Seasons*, v. 856). They grant that Joseph's education was defective and that as a boy he could hardly write his name. He himself asserted that he was 'a rough stone' and desired 'the learning of heaven alone.' His mother said of him that in his nineteenth year he had never read the Bible through.

The 'conversion' of Joseph took place in 1820 near Palmyra. It was a time of great local excitement on the subject of religion. Joseph had retired to a solitary place and knelt in prayer to God. He fell into a trance, and was seized with a feeling of great depression and terror. "Just at this moment of great alarm," he continues in his description of the event, "I saw a pillar of light exactly over my head, above the

brightness of the sun, which descended gradually until it fell upon me. When the light rested upon me, I saw two personages whose brightness and glory defy all description, standing above me in the air. One of them spake unto me. . . . When I came to myself again I found myself lying on my back, looking up into heaven." The second of the 'visions of Joseph' took place on September 21, 1823, when the heavenly messenger disclosed the hiding place of the gold plates upon which the *Book of Mormon* was asserted to be engraved. There was a series of seven visions in all, which extend over as many years, and which, as in the case of Mohammed, have been attributed by some to epilepsy.

Connected with these trances is the so-called "transcription of the gold plates." As a money-digger among Indian mounds young Smith made use of a 'peek-stone.' This became the famous 'Urim and Thummim,' whereby "Joseph the Seer translated the reformed Egyptian of the plates of Nephi." Students of abnormal psychology infer from recent investigation of the original document with its sprawling superscription 'Characters' that it is analogous to the automatic writing of the semi-hypnotized crystal gazer, and urge that Smith's later methods of 'translating' bear out this supposition of a sub-conscious activity. Throwing himself into a condition of reverie by gazing into his 'interpreters,' he dictated to his scribes what appeared to him to be communications of supernatural origin. Such an interpretation of Joseph's visions in terms of abnormal psychology is thought blasphemous by the Saints. They hold the records to be divinely inspired, while Smith compared his peculiar psychic experiences to those of Saint Paul. Of Smith's writings the first was the *Book of Mormon*, begun in September, 1827, at Manchester, N. Y., continued at Harmony, Pa., and finished at Fayette, N. Y., June, 1829. The original manuscript has disappeared. There remains only a duplicate made by Smith's principal scribe, the schoolmaster Oliver Cowdery. The first edition was printed at Palmyra in 1830. Two other editions were published within ten years. The fifteen books of this "Sacred History of Ancient America from the Earliest Ages After the Flood to the Beginning of the Fifth Century of the Christian Era" Smith himself thus summarized: "The history of America is unfolded from its first settlement by a colony that came from the Tower of Babel to the beginning of the fifth century of the Christian Era. We are informed by these records that America, in ancient times, has been inhabited by two distinct races of people. The first were called Jaredites, and came directly from the Tower of Babel. The second race came directly from the city of Jerusalem, about six hundred years before Christ. The Jaredites were destroyed about the time that the Israelites came from Jerusalem. The principal nation of the second race fell in battle toward the close of the fourth century. The remnant are the Indians. This book also tells us that our Saviour made His appearance upon this continent after His resurrection; that He planted the Gospel here in all its fullness and richness and power and blessing; that they had apostles, prophets, pastors, teachers, and evangelists; the same order, the same priesthood, the same ordinances, gifts, powers, and blessing, as was enjoyed on the

Eastern Continent; that the people were cut off in consequence of their transgressions; that the last of their prophets who existed among them was commanded to write an abridgment of their prophecies, history, etc., and to hide it up in the earth."

Certain adverse critics dismiss the *Book of Mormon* as a mere hodge-podge of petty information, gross anachronisms, and biblical borrowings; this, in the opinion of another class of adverse critics, is to miss its significance both as a cryptic biography and as a characteristic bit of provincial Americana. The latter declare that in addition to private affairs inadvertently incorporated there are water marks of some historic interest to be found in the document. They detect, in Scriptural paraphrase, descriptions of the current agitations against Romanism, infidelity, and Freemasonry, and even references to the so-called Washingtonian movement for total abstinence. The widely prevalent theory that the Indians were the lost ten tribes of Israel is also embodied. The Nephites were not merely the modern red men in disguise, but in their mental habits they intimately resembled local sectarians. The speech of Nephi contains quotations from the Westminster Confession of Faith, and the speech of Lehi reflects the heretical tenets charged against the Presbytery of Geneva, in whose bounds Joseph himself lived. Applying the methods of the higher criticism, unbelievers note that the book is filled with the catchwords of the Methodist camp-meeting exhorter, and cite in particular the last section of the *Book of Mormon*, from its likeness to a Methodist book of discipline, as final proof of the writer's dependence on local theology. Believing the *Book of Mormon* to be the veritable word of God delivered through verbal inspiration, the Mormon apologists consider it unwarrantable to apply the higher criticism to their bible. Nevertheless such criticism renders untenable previous arguments against the authenticity of the work.

The ideas in the book were within the young author's ken. His Calvinism need not have been formally derived from the *New England Primer*, nor his arguments on Deism from Thomas Paine's *Age of Reason*, since the backwoods pulpit and the political gossip of the taverns supplied these notions. If the internal evidence makes the *Book of Mormon* indigenous, the external evidence is equally against a foreign authorship as presented in the ordinary Spaulding-Rigdon theory. This is, briefly, that a romance of prehistoric America, written in Ohio in 1812 by a Congregational minister, Solomon Spaulding, was the 'source, root, and inspiration' by which Smith's associate, Sidney Rigdon, concocted the scheme of a Golden Bible. The recovery in 1885 of the alleged original of Spaulding's "Manuscript Story" has been to the Mormons conclusive proof of its non-connection with the *Book of Mormon*, for there is no real resemblance between the two.

The day of the founding of the Mormon Church was April 6, 1830. On that day Smith claimed to have received a revelation beginning: "Thou shalt be called a seer, a translator, a prophet, an apostle." This is a characteristic sentence from the second half of the Mormon canon, the *Book of Commandments*. This rarest of original Mormon sources is in part a book of discipline, containing the "Articles and Cove-

nants of the Church of Christ." To add to the confusion of contents, this pamphlet of 55 chapters has its biographical side. Like its enlargement, the revamped *Book of Doctrine and Covenants*, it comprises "revelations to Joseph Smith, Jr., for the building up of the Kingdom of God in the last days." Concerning the origin of these vaticinations, David Whitmer, the third witness of the gold plates, asserted that the revelations were given through the stone through which the *Book of Mormon* was translated, and Parley P. Pratt described how "each sentence was uttered slowly and very distinctly." Smith himself was more cautious as to the divine origin of his messages, saying, "We never inquire for special revelation only in case of there being no previous revelation to suit the case."

The local receptiveness, at that time, to new religious ideas is manifest by the success of other leaders. Jemima Wilkinson prophesied at Crooked Lake; William Miller predicted the end of the world at Rochester; and the Fox sisters started Spiritualism only ten miles from Joseph Smith's home. The return of apostolic gifts was hoped for by the local Quakers, Primitive Baptists, and Restorationists. A half-year later, during the revivalistic meetings of the Mormons at Kirtland, remarkable religious phenomena were reported.

The Kirtland revival was the turning point in the life of the infant Church. Because of it there came a "revelation to the churches in New York, commanding them to remove to Ohio." It was now that Sidney Rigdon played his part in the Latter-Day movement. He had been a Baptist preacher in Pittsburg, and a minister of the Disciples' Church in Ohio. He organized at Kirtland a branch of Saints of one hundred members, and in February, 1831, Smith betook himself thither. David Whitmer asserts that Rigdon soon obtained more influence over Smith than any other man living. In exchange for the home-made Mormon Bible, Rigdon gave a foreign framework to the Mormon Church. He got hold of some of the transplanted ideas of Fourier the French collectivist. Nineteen families in Rigdon's neighborhood had already formed themselves into a common stock company. A revelation of February, 1831, runs: "Thou shalt consecrate all thy properties which thou hast to impart unto me with a covenant and a deed which cannot be broken; the bishop shall appoint every man a steward over his own property, inasmuch as is sufficient for himself and family; the residue shall be kept in my storehouse, to administer to the poor and needy, and for the purpose of purchasing lands, and the building up of the New Jerusalem."

Smith's Ohio business enterprises brought financial loss. He first opened a general store at Hiram which failed. Land speculation also brought loss. Three farms at Kirtland, costing over \$11,000, were to be turned into a permanent city of Zion with 32 streets. Like the Church tannery and the Church sawmill, this paper city had no financial foundation. At the same time a \$40,000 temple was begun (the corner-stone was laid July 23, 1833), and although most of the Saints gave one-seventh of their time to its building without pay, a debt of from \$15,000 to \$20,000 was left upon it. Meanwhile an attempt was made to prevent financial disaster by establishing the Kirtland Safety Society Bank. Reorganized in 1837 as the Kirtland Society Anti-Banking Company and

uttering at least \$200,000 of its notes, the crash came within ten months, and Secretary Rigdon and Treasurer Smith fled to Missouri.

As president of the Church in Ohio, Smith's communistic ambitions were mingled with hierarchical schemes. Besides the United Firm and the Safety Bank, in 1833 he dedicated to the Lord the printing office of the *Latter-Day Saints' Messenger and Advocate*. In 1834 he organized the First High Council of the Church of Christ, with himself, Rigdon, and Williams as the First Presidency. In 1835 he chose the Twelve Apostles, among whom were Brigham Young, the Lion of the Lord; Parley Pratt, the Archer of Paradise; and Lyman Wright, the Wild Ram of the Mountain. In 1836 Smith instituted the several quorums or executive bodies of the Church, first the Presidency, then the Twelve, and the Seventy, also the counselors of Kirtland and Zion. In 1837 he set apart Apostles Kimball and Hyde to go on a mission to England, the first foreign mission of the Church.

In 1832, as a prophet of woe urging the Saints to sell all they had and flee from the wrath to come, Smith brought the mob upon himself and Rigdon at the town of Hiram. In the great apostasy of 1836 the Church lost some of its pillars. The three witnesses to the *Book of Mormon* were soon cut off. In the bull of excommunication David Whitmer, the anti-polygamist, was compared to Balaam's ass; Martin Harris was called a negro with a white skin, while all the "dissenters," says the Prophet, "are so far beneath my contempt that to notice any of them would be too great a sacrifice for a gentleman to make."

While the Saints were yet in Ohio there is evidence that polygamy was both practiced and sanctioned by those highest in authority. The Reorganized Church of Latter-Day Saints under the leadership of the Prophet's son, Joseph Smith, 3d, has claimed that the doctrine of 'spiritual wifery' was introduced, not by the Prophet, but by the older men, notably Hurlburt, Bennett, and Rigdon. The real acts of these scapegoats may never be known, for their testimony as to Smith's implication in their practices was declared unprintable. Hence what remains of the evidence against the Prophet is merely circumstantial, and is to be counterbalanced by his early attempts at ostensible suppression. In October, 1831, Smith admonished William E. McLellin through a revelation: "Commit not adultery, a temptation with which thou hast been troubled." In July, 1833, Smith wrote to the brethren in Zion to "guard against evils which may arise from accounts given of women." In 1835 the *Book of Doctrine and Covenants* declared: "Inasmuch as this Church of Christ has been reproached with the crime of fornication, and polygamy: we declare that we believe, that one man should have one wife; and one woman but one husband."

The third place of settlement by the Saints was Missouri. Smith's order to Oliver Cowdery to go and establish the Church among the Lamanites brought four Mormon missionaries to Jackson County as early as 1831. The town of Independence was declared the new city of Zion and a site for a temple was chosen there in August. The converts poured in from the Middle Atlantic States and Canada with such rapidity that the non-Mormons were somewhat

alarmed. The printing of the *Book of Commandments* with its revelations to the Saints calling Missouri "the land of your inheritance, which is now the land of your enemies," led to acts of hostility from the citizens of Jackson County. The burning of barns and the shooting into Mormon houses at night was followed by demands for the removal of the Mormons from the country within a reasonable time, and for the prohibition of future Mormon settlement therein. The element of border ruffianism was doubtless responsible for the speedy destruction of the Church printing office, and for the tarring and feathering of Bishop Partridge, yet the Saints themselves were not without fault. Their agreement to depart within eight months was written, as they alleged, "supposing that before the time arrived the mob would see their error and stop the violence." Since Governor Dunklin was loath to call out the militia, the mob drove at least fifteen hundred Mormons across the Missouri, the women and children suffering terrible hardships in the November storms. The negotiations for financial redress proved fruitless, for, as the Governor himself confessed, conviction for any violence committed against a Mormon could not be had in Jackson County. Until 1838 the town of Far West was materially prosperous and on good terms with its neighbors, but upon the Prophet's arrival in that year there arose dissensions within and without. The Presidency was deposed on a charge of misappropriating trust funds and Oliver Cowdery expelled for counterfeiting. With the further defection of Thomas B. Marsh, president of the Twelve, and Orson Hyde, one of the original Apostles, there came the establishing of an organization called ultimately the Danite Band, and known popularly as the Avenging Angels. Bound to secrecy by blood oaths, obeying any behest of the Church against property or life, this American variety of thugs owed its origin to Smith's revelation of August 6, 1833—"Thine enemy is in thine hands, and if thou reward him according to his works thou art justified; if he has sought thy life, and thy life is endangered by him, thine enemy is in thine hands and thou art justified." The year 1838 also saw the establishment of the tithing system. Forty years afterwards the annual tithing revenues were estimated at a million dollars, appropriated, according to Brigham Young, to church erection, emigration, and poor relief.

The beginning of civil strife in Missouri dates from Rigdon's 'salt sermon,' a Fourth of July oration (1838), in which there was officially predicted a war of extermination between Saints and Gentiles. After the State election in August, it was reported to Governor Boggs that the Mormons were so numerous and well armed that the judicial power of Daviess and Caldwell counties was wholly unable to execute any civil or criminal process against a Mormon. A regiment of militia was thereupon called out, but General Doniphan, fearing that much blood would be spilled, disbanded most of his force. At the Prophet's suggestion the organization of the 'Fur Company' let loose foraging bands over the country. Then followed the killing of the Danite leader, 'Fear Not' Patten, the defeat of the Missouri Captain Bogart, and the retaliation upon the Mormons in the infamous Hawn's Mill Massacre. On October 27th the Governor

issued orders that the Mormons must be treated as enemies, and must be exterminated or driven from the State. There ensued a determined campaign against the Mormons. The final terms of surrender, offered at Far West by General Lucas, included the payment of debts and the expulsion from the State of all the Mormons except the leaders, who were subject to trial. In the trial of Joseph and Hyrum Smith, Rigdon, and others at Liberty, testimony was given that the members of the Danite Band considered themselves as much bound to obey the heads of the Church as to obey God, and that Smith advised the people to spoil the Gentiles. The Prophet was confined in Liberty until April, 1839.

The fourth place of removal of the Saints was Illinois, and here their experience was but a repetition of their last migration. Friction was sure to arise because of the lawless squatters and timber thieves in the northern counties and because of the politicians at Quincy and their toadying for the Mormon vote. Smith purchased the city of Commerce on the banks of the Mississippi for about \$70,000; the name of the town was changed to Nauvoo, supposedly derived from a Hebrew word meaning beautiful. The rapid growth of Nauvoo was largely due to the religious propaganda. At home, proselytizing was extended from Maine to Michigan, while mass meetings were called in the Eastern cities to express sympathy with the Mormons as oppressed by the enemies of the freedom of religious opinion. Abroad, the press knew even less of Latter-Day ambitions, since the Mormon appeals in England were directed to the illiterate and superstitious. At Liverpool, Orson Pratt published his *Discovery of Ancient American Records* and the Mormon organ, the *Millennial Star*, advertised "Bones set through faith in Christ." But that which appealed most strongly to English weaver, Scotch miner, and Welsh peasant was the prospect of owning a farm in the land of Missouri, where "the Lord had been raining down manna in rich profusion." The success of the Mormon missionaries in Great Britain is evinced by the growth of the system of chartering ships for emigrants, from one vessel and 200 passengers in 1840, to 8 vessels and 1614 passengers in 1842.

In the meantime Mormonism in America was flourishing both financially and politically. Through efficient lobbying the Illinois Legislature granted charters for the city of Nauvoo, the Nauvoo Legion, and the University of the City of Nauvoo. Three-fourths of the university faculty was drawn from local talent, being composed of Orson Pratt, Orson Spencer, and Sidney Rigdon, with James Keeley, a graduate of Trinity College, Dublin, as president. An army officer, in 1842, praised the Nauvoo Legion, but expressed his fear of the growth of a Mormon corps filled with religious enthusiasm and led on by ambitious officers. This fear was justified by the attempted assassination of Governor Boggs, of Missouri, by O. P. Rockwell, a Mormon living at Nauvoo. The Prophet, having called Boggs a 'knave, butcher, and murderer,' was indicted as instigator of the plot. He was then released by his own municipal court. Smith's ability to swing votes led to an enlargement of his political ambitions. He called on President Van Buren with a claim for Mormon losses

amounting to \$1,381,044.55½. Failing to obtain redress from Congress, he addressed letters of appeal to Henry Clay and John C. Calhoun. On receiving non-committal answers from these rival Presidential candidates, he ran for President himself.

Smith was assassinated in jail at Carthage, Ill., June 27, 1844. The causes leading up to his death were not merely political, but also financial and social. He secured relief from his Kirtland creditors only by taking advantage of the bankruptcy act, and the numerous thefts around Nauvoo were laid to the Mormons. Smith was also in trouble with his associates; in 1843 he deposed Rigdon as his adviser. On July 12, 1843, there came the famous "Revelation on the Eternity of the Marriage Covenant, including Plurality of Wives. Given through Joseph, the Seer, in Nauvoo, Hancock County, Ill." This document was not promulgated until 1852; its authenticity is, however, proved by its similarity in style with the *Book of Mormon*. In this document the authority for polygamy is derived from the example of the Old Testament patriarchs, but the Mormon harem is confined to ten virgins. The Prophet's ideas on 'spiritual wifeism,' like his early gospel, appear to have been 'plain and simple' and without any philosophic basis. Whatever Smith taught on the 'mysteries of the kingdom' is derivable from the writings of the two Pratts, who excoigated a system of metaphysics justifying plurality of wives. According to Orson, called the Gauge of Philosophy, "celestial marriage opens the way for all women who wish to marry to fill the measure of their creation. . . . It shows how the innumerable creations of God [i.e. this world and other planets] may be peopled with intelligences. . . . Woman without man and man without woman cannot be saved. The larger the progeny a man has, the greater will be the fullness of his eternal glory." These were the esoteric teachings of the Saints, whispered as early as 1840. Smith's plural wives numbered over a score, most of whom were taken by the Apostles Kimball and Young after the Prophet's death. Outward proof of the practice of polygamy in the forties is to be sought in such virulent persecutions as caused the expulsion of fifteen thousand Saints from Missouri, and in such publications as the *Times and Seasons* 'extract from a letter from the vicinity of Nauvoo,' which says, "The excitement on both sides of the river against the Mormons is increasing very fast. The conduct of Joseph Smith and the other leaders is such that no community of *white men* can tolerate." Turmoil now arose in the Mormon camp itself. Three well-informed men, Dr. Foster and the two Laws, started a paper called the *Expositor*, which, besides advocating 'disobedience to political revelations,' sought to 'explode the vicious principles of Joseph Smith.' The first and only number condemned the Church appropriation of property without accounting, the preaching of the doctrine of plural gods, sealing, and the plurality of wives. The wanton destruction of the *Expositor* press and property on June 10th under the order of Joseph Smith, as lieutenant-general of the Nauvoo Legion, was succeeded by great commotion among non-Mormons. Outlying counties raised men and money for a 'war' against the Saints, for Nauvoo was now declared

under martial law. On June 22d the Prophet and a few others started to flee to the Rocky Mountains, but upon Governor Ford's promise of protection, Smith surrendered himself at Carthage on the 24th. The first arrest was made on a charge of riot, the second on a charge of treason in levying war against the State. In appointing the Carthage Grays, who were the avowed enemies of the Smiths, as a guard over the jail, the Governor made a fatal blunder. On June 27th, with the evident collusion of the guard, a band of disguised assailants, presumably from the Warsaw regiment, brutally murdered the Prophet and his brother Hyrum.

With the death of Smith rival claims to the prophetic successorship arose between Brigham Young, J. J. Strang, and Smith's own son. The 'Strangites' disappeared with the killing of their leader in 1856 because of his polygamous practices. The 'Young Josephites,' however, founded in 1852 the *Reorganized Church of Jesus Christ of Latter-Day Saints*, and the body still exists under the presidency of Joseph Smith, 3d. It claims to be the continuation of the original Church of Latter-Day Saints, and has been recognized as such by the courts. It maintains that the doctrines of plurality and community of wives are heresies. The headquarters of the Church are at Lamoni, Iowa. It has a publishing house, and issues two weekly papers (*Zion's Hope*, for Sunday-schools, and the *Saints' Herald*, a general religious weekly and the official organ), a monthly magazine (*Autumn Leaves*) for young people, and books and tracts. It maintains Graceland College and a home for the aged poor. There is another establishment at Independence, Mo., with a printing press, whence are issued *Zion's Ensign*, a weekly paper, books, and tracts. The Church has about 45,000 members.

The logical successor of Smith was Brigham Young. Young joined the Mormon Church in New York State on April 14, 1832, and in the same year was sent by the Prophet from Kirtland on a missionary tour in Canada. Returning to Ohio with a band of converts in 1834, he went with the 'Army of Zion' to Missouri as one of the 'captains of tens.' In 1835 he was appointed one of the original Quorum of Twelve. Young assisted Smith in his flight to Missouri in 1838, and two years after sailed to Liverpool on a mission. The Prophet was fond of him, and Young's faithfulness to the cause is shown by his being left President of the Twelve upon Smith's assassination.

The Prophet's tragic death was of no avail against the domestic enemies of the Church. In January, 1845, the Nauvoo charter was repealed. The situation being recognized as intolerable, Young officially arranged to leave the country in the spring, a delegation having previously been sent out to investigate locations in California and Oregon. The final choice of Utah was due to a chance meeting with some trappers from the Great Salt Lake Valley. The organization of the Mormon exodus was in many respects remarkable. A pioneer company of young men was first sent ahead to plant crops, which the following companies should reap. Meanwhile Nauvoo had been turned into a vast wagon shop, so that the first company comprised a train of one thousand wagons. This 'Camp of Israel,' which included President Young and the Twelve Apostles, was subdivided into companies of from fifty to

sixty wagons in charge of captains of fifties, captains of tens, and contracting commissaries. The versatility of the American pioneer was displayed in the establishment of way stations, with various repair shops and with a flouring mill built by Young himself. The largest company, which started from Elk Horn River on July 4th, included 1553 persons, with 566 wagons. By 1848 all the Mormons had crossed the plains except a few left on the Missouri as forwarding agents for emigrants from the Eastern States and Europe.

By March, 1848, the population of Salt Lake City numbered 1671, with 423 houses built. In spite of the failure of the crops and the consequent suffering of the first winter, glowing accounts of the new Zion were sent to England, with the result that within two years the English immigrants included men of many professions and trades. Young early projected cotton, woolen, and glass factories, for there were no sources for manufactured goods nearer than one thousand miles. In all this the aim of the leaders was to establish a State entirely self-supporting. But the balance sheet in 1852 showed a deficit. Young undertook to retrench expenses by giving less assistance to immigrants, but this policy turned out disastrously. The economic salvation of Mormonism was not due to the financial abilities of the body, but to outside causes. Abundance of money was brought to Salt Lake City by those who were hastening to California for gold, and by the building of the Pacific Railroad.

The political success of Mormonism was equally fortuitous. The war with Mexico having transferred the sovereignty of this region to the United States Government, on March 4, 1849, a convention at Salt Lake City adopted a constitution for the State of Deseret. The confusion of the Mormon political ideas was manifested in calling Deseret a State and at the same time in dispatching a Territorial delegate to Washington. Babbitt's application was rejected largely because of the hostility of the Illinois Democrats.

The growth of Young's dictatorship depended on mixed personal and religious reasons. He was known as hard-working Brigham Young; and his word was counted the word of God to his people. The power of the head of the Church was also increased by the issuance of paper money, by the strict application of the tithing system, and by the order that no man should hoard up his property. Young's addresses in the temple show that, with the development of his despotism, there came a loss of personal liberty among the laity. In connection with the School of the Prophets he appointed Church confessors to go among all families. In 1856 occurred the so-called 'Reformation,' in which the discontented were weeded out. After the murder of the would-be apostate, William R. Parrish, a deed instigated by Young himself, there came the organization of four hundred 'Wolf Hunters,' whose object was to prevent such rare escapes as that of Frederick Loba and his wife. By 1856 the doctrine of blood atonement was in operation. Apostasy was practically declared a capital crime to be atoned for only by having the blood spilled upon the ground, and Rosmos Anderson, who wanted to marry his stepdaughter against the wishes of the ward bishop, had his throat

cut by the ecclesiastical executioners, so that his blood might run into his freshly dug grave.

The murder of the Aikin party in 1857 came under Young's policy of keeping the Gentiles out of Utah. Six men from San Francisco, with an outfit valued at \$25,000, were shot while being 'escorted' by 'Bill' Hickman, who was known as 'Brigham's Destroying Angel.' In the same year occurred the most wholesale of these affairs, the Mountain Meadows Massacre (q.v.).

Chief among the reasons for governmental neglect of the Mormons were the appointment of mere party hacks as Territorial officers and judges and the impotence of the Federal Government at the approach of the Civil War. Furthermore, the authorities were ignorant concerning Mormon practices and ambitions. Upon the establishment of the Territory of Utah, in 1851, Brigham Young was appointed Governor. When the Federal appointee, Judge Brocehus, ventured to criticise polygamy, Young publicly called him a coward and asked him to "apologize to the satisfaction of the ladies." President Pierce's offer of the Governorship to Lieutenant-Colonel Steptoe led Young to threaten vengeance for this 'infringement' upon his individual rights and privileges. By 1856 the political parties began to make capital out of the Mormon situation. Stephen A. Douglas asserted that it was the duty of the President to remove Brigham Young and all his followers from office. In his message of 1857, President Buchanan declared that there was no longer any government in Utah but Brigham Young. All this was declared to be a Democratic scheme to blind the North regarding the pending slavery issue. However, a force of 1500 troops was dispatched under General Scott, whereupon Young announced that he "would ask no odds of Uncle Sam or the devil." The Nauvoo Legion was recruited from all able-bodied males between eighteen and forty-five, martial law was declared in the Territory, and the Mormons harassed the Federal column by setting fire to the grass, stampeding their cattle, and burning the supply trains. An advance by winter into the Salt Lake Valley being deemed out of the question, Colonels Johnston and Alexander joined forces near Fort Bridger. Meanwhile Young, determined upon being the civil as really as he was the ecclesiastical head, commissioned Col. T. L. Kane as lobbyist at Washington. Taken with the pro-Mormon report of Governor Cumming, the result was a full and free pardon offered by President Buchanan to the very leaders whom Judge Eckles had charged with adultery. The attitude of the Church being considered treasonable during the Civil War, in May, 1862, Utah was put under military supervision. Colonel Connor's plans to overawe Young were frustrated by Lincoln's let-alone policy, and it was not until the lapse of a generation that the Mormon leaders unwillingly traded polygamy for Statehood.

The anti-polygamy legislation began with the Morrill bill of February, 1860. The severest punishment being merely the statutory penalty for bigamy, the measure was ineffective. The Cullom bill of 1869 was fought by Delegate Hooper on the ground that the Mormon views of the marriage relation were an essential part of their religious faith and therefore constitutionally guaranteed. Convictions under the Poland bill of 1874 being appealed, the United States Su-

preme Court ruled that religious belief cannot be accepted as a justification for an overt act made criminal by the law of the land. President Hayes, in his message of December, 1879, struck at the root of the matter by declaring that polygamy could only be suppressed by taking away the political power of the sect which encouraged and sustained it. Like remarks of Presidents Garfield and Arthur, in 1881, led to the Edmunds bill of 1882, which provided that no polygamist should be entitled to vote in any Territory or to hold office under the United States. Within two years 12,000 voters were disfranchised by this act, and within eight years 468 persons, mostly in the rural districts, were convicted for polygamy or unlawful cohabitation. When in 1890 the courts declared the ecclesiastical property confiscated because the Mormon Church was an organized rebellion, Young's successor, President Wilford Woodruff, issued a manifesto in which he advised the Latter-Day Saints to "refrain from contracting any marriage forbidden by the law of the land." The difficulties of obtaining Statehood and the unseating of Congressman Roberts in 1899 led the Church to so modify its views of political dominion as to declare that the Mormons "form not a rival power as against the Union, but an apostolic ministry to it, and their political gospel is State rights and self-government." A late estimate places the number of Mormons in the United States, exclusive of the Reorganized Church, at about 300,000. They are no longer receiving large accessions from foreign propaganda among Teutonic races.

According to the present official handbook, the religion of the Latter-Day Saints consists of doctrines, commandments, ordinances, and rites revealed from God to the present age. The first principle is faith in God and in Jesus Christ; the next is repentance from all sin, then follows baptism for the remission of sin, as a preparation for the gift of the Holy Ghost, bestowed by the laying on of hands. Obedience to these principles is necessary to membership in the Church of Jesus Christ of Latter-Day Saints. Faith in God is the beginning of religion, and confers spiritual gifts such as healings, miracles, tongues, the interpretation of tongues, discernment, visions, dreams, prophecy, and revelation. Authority to administer in the name of the Deity must of necessity come from God. This involves revelation. There having been no communication with heaven for hundreds of years, the world was without divine authority to administer gospel ordinances until Joseph Smith. By John the Baptist he was ordained to the lesser or Aaronic priesthood, and by Peter, James, and John to the higher or Melchizedek priesthood, receiving the Holy Apostleship and the keys of the kingdom with power to seal on earth so that it might be sealed in heaven. The religion of the Latter-Day Saints is progressive. It cannot be defined in a written creed. It is added to by the revelations of God as the capacities of the Saints enlarge and the needs of the Church increase. Every member of the Church is entitled to the blessings of divine communion and revelation for his or her own comfort and guidance. Revelations for the whole Church are only given through its President, who is its earthly head and holds the keys of the kingdom. Among the later revelations to the Church are the doctrines of baptism

for the dead and of celestial marriage. As there was no authority among men to administer the ordinances of the gospel from the days of the early Apostles or shortly after, to the time of the restoration of the priesthood to Joseph Smith the Prophet, all the baptisms during the intervening period were void. The friends of the dead, however, are permitted to take their names and be baptized in their stead, the ceremony being duly witnessed and recorded on earth and accepted and ratified in heaven. Other ordinances may also be admitted by proxy, the living in behalf of the dead.

Celestial marriage is marriage unto all eternity. According to the revelation on this subject all the marriages entered into without divine authority are dissolved by death. Celestial marriage is entered into by those who have obeyed the gospel and become the sons and daughters of God by adoption. The woman is given to the man and they become one flesh. That which is thus sealed on earth is sealed in heaven, and is as valid as though performed in person by the Deity. If a wife thus sealed to her husband should precede him in death, it would be his privilege to wed another. The second wife, or third, if the second should die, would be sealed to him in the same manner as the first. They would all be his equally. In the resurrection he would have three wives, with their children, belonging to him in the everlasting covenant. The revelation on celestial marriage declares that if given to man in the everlasting covenant in the way appointed of God, he is not under condemnation, but is justified in receiving more wives than one. They are sealed to him and become his, and he cannot commit adultery with them because they are his and his alone. None of them are concubines or mistresses, or mere ministers of lust. Celestial marriage in its fullness is ordained of God. It is an establishment of religion. It is ecclesiastical in its nature and government. It is therefore outside the domain of constitutional law. Being within the pale of the Church, its free exercise cannot of right be prohibited.

The Mormon system of proselyting is simple. Twice each year, at the annual and semi-annual conferences held in Salt Lake City, a number of the faithful elders of the Church are selected by the authorities and 'called' by the assembled saints to visit the home or the foreign field. They travel at their own charges. Each mission is presided over by some elder selected by the general authorities of the Church, and the minor divisions of branches and conferences have their proper officers. The Utah missionaries remain in their fields of labor from two to four years and until released by competent authority to return home. Mormon missionaries have gone to every State and Territory of the Union, also to Canada, Mexico, the Antilles, Brazil and Peru, Great Britain, Germany, Switzerland, France, Italy, Denmark, Sweden, Norway, Iceland, Finland, South Africa, India, the East Indies, China, Australia, New Zealand, the Society Islands, and the Hawaiian Islands. The Church has an organization known as the Perpetual Emigration Fund Company, which makes advances of money to assist the faithful to Utah and adjoining districts.

The Mormon hierarchy is complicated. Joseph Smith and Oliver Cowdery were the first two

elders and apostles in the Church. Smith, who bore the title of Prophet, Seer, and Revelator, stood at the head of the Melchizedek priesthood, of which three presiding High Priests, chosen by the body, form a quorum of the Presidency of the Church. The President of the Church and his two counselors form the First Presidency, and the three together represent the Trinity. The Twelve Apostles form a quorum equal in authority and power to the three Presidents previously mentioned. The Twelve are a traveling presiding High Council, under the direction of the Presidency of the Church, to build up the Church and regulate its affairs in all nations. The Seventies are also called to preach the gospel and form a quorum equal in authority to that of the Twelve. The Seventy Elders have seven presidents to preside over them, chosen out of the number of the Seventy. There are now over 120 of these Seventies. In addition to these the officers of the Melchizedek priesthood are high priests and elders. The officers of the Aaronic or lesser priesthood are priests, teachers, and deacons. There are twenty-one Stakes of Zion in Utah. Over each stake there is a presidency consisting of a president and two counselors, who are high priests. This presidency bears the same relation to the stake that the First Presidency bears to the whole Church. A high council in each stake, consisting of twelve members, who are also high priests, act for the stake as the traveling presiding High Council act for the Church in all the world. It is the province of the high priests to preside, while the special calling of the Seventy is to travel and preach the gospel and build up the Church.

BIBLIOGRAPHY. The four chief collections of Mormoniana in America are: The Church Archives at Salt Lake City; Government publications at Washington; the Berrian Collection, New York Public Library, rich in first editions and rare publications of the Early Church; the collection of the State Historical Society of Wisconsin, at Madison, which includes the unique private collection of Mr. A. T. Schroeder, late of Salt Lake City. Mormon Periodicals: *Deseret News* (Salt Lake City, 1852-87); *Elders' Journal* (Kirtland, Ohio, and Far West, Mo., 1837-39); *Evening and Morning Star* (Independence, Mo., and Kirtland, Ohio, 1832-34); *Journal of Discourses* (by Brigham Young and the Church leaders, Liverpool, 1854-86); *Latter-Day Saints' Messenger and Advocate* (Kirtland, Ohio, 1834-37); *Latter-Day Saints' Millennial Star* (Liverpool, 1840); *Times and Seasons* (Nauvoo, Ill., 1834-45; vol. iii. ed. by Smith; early files suppressed by Brigham Young). Pro-Mormon Works: Bancroft, *History of Utah* (San Francisco, 1890); *Handbook of Reference to History, etc.* (Salt Lake City, 1882); Joseph Smith, Jr., *Book of Commandments* (Zion, Jackson County, Mo., 1833; exceedingly rare; Salt Lake Tribune reprint, 1884); *Book of Mormon* (1st ed., Palmyra, N. Y., 1830; 2d ed., equally rare, Kirtland, Ohio, 1835); *The Pearl of Great Price* (selections from the writings of Smith, Salt Lake City, 1891); Lucy Smith, *Biographical Sketches of Joseph Smith and His Progenitors* (by the mother of the Prophet; suppressed by Brigham Young; Liverpool, 1853, and Plano, Ill., 1880); Joseph Smith, 3d, and Heman C. Smith, *History of the Church of Jesus Christ of Latter-Day*

Saints (from the standpoint of the Reorganized Church, Lamoni, Iowa, 1901); Thompson, *Evidences in Proof of the 'Book of Mormon'* (suppressed by Brigham Young; Batavia, N. Y., 1841); Tullidge, *History of Salt Lake City* (the work of a reformer, but censored by the Church; Salt Lake City, 1886); Whitmer, *An Address to All Believers* (written by a primitive non-polygamous Mormon, Richmond, Mo., 1887). Anti-Mormon Works: Ferris, *Utah and the Mormons* (New York, 1854); Gunnison, *The Mormons* (description of early life in Utah by an army officer; Philadelphia, 1856); Howe, *Mormonism Unveiled* (the earliest first-hand information against Smith, very rare; Painesville, Ohio, 1834); Hyde, *Mormonism: Its Leaders and Designs* (the confessions of an apostate; New York, 1857); Linn, *The Story of the Mormons* (the most complete and exhaustive history of Mormonism; New York, 1902); Riley, *The Founder of Mormonism* (a psychological study of Joseph Smith, Jr.; New York, 1902); Stenhouse, *The Rocky Mountain Saints* (a vivid portrayal by an able ex-Mormon; London, 1870); Tucker, *Origin, Rise, and Progress of Mormonism* (the exposé of a fellow-townsmen of Smith; New York, 1867); *Utah Commission* (Government Reports under the Edmunds Law, Washington).

MORMYR/IDÆ (Neo-Lat. nom. pl., from *Mormyrus*, from Gk. *μормύρος*, *mormyros*, sort of sea-fish). A family of malacopterous fishes, allied to the pike family, but according to Cope forming a separate group, Scyphophori, having rather long, compressed bodies, and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, envelops the gill-covers and gill-rays, and leaves only a slit for gill-opening, and the color is dark. The mouth is small. All the dozen or more species inhabit the rivers of Northern Africa and are nocturnal in their activities. The beaked or sharp-nosed *mormyrus* (*Mormyrus Petersi*) is regarded as one of the best fishes of the Nile, and is distinguished by the production of the lower jaw into an elongated fleshy appendage. It is caught by lines baited with worms, and is represented on many Egyptian monuments.

MORNAY, môr'nâ', PHILIPPE DE. A Huguenot statesman. See DU PLESSIS-MORNAY, PHILIPPE.

MORNING-GLORY. Various species of *Ipomœa*, especially *Ipomœa purpurea*, cultivated for their large funnel-shaped, diversely colored flowers, which open in the early morning, and close during the heat of the day. The garden varieties are propagated from seeds sown in sunny situations in ordinary garden soil. Their large and abundant, roundish heart-shaped leaves make an excellent screen, the vines often attaining a height of ten-feet or more by midsummer. See PLATE OF DICOTYLEDONS.

MORNY, môr'nâ', CHARLES AUGUSTE LOUIS JOSEPH DE, Duke (1811-65). A noted French politician of the second Empire. He was the illegitimate son of Queen Hortense and of the Comte de Flahault, and consequently half-brother to Louis Napoleon (later Napoleon III). He was born in Paris, October 23, 1811. The secret of his parentage was well kept for a time and the Comte de Morny received 800,000 francs to adopt him; but he was educated by his 'grand-mother,' Madame de Souza-Flahault; and Queen

Hortense left him at her death, in 1837, an annuity of 40,000 francs. Morny took a nominal part in the Revolution of July, 1830, and entered the army in 1832 as a sublieutenant. He served with some distinction in Algeria, being made a Chevalier of the Legion of Honor; but he soon abandoned military life, and in 1838 made his appearance as a manufacturer of beet-root sugar, and published a pamphlet on the subject. From that time he was involved in all sorts of commercial and financial speculations. Chosen a Deputy in 1842, he became the leader of fashion at Paris, but his financial schemes began to go wrong, and after the Revolution of 1848 he attached himself to the cause of his half-brother and was one of the prime instigators of the subtle and treasonable policy which culminated in the coup d'état of 1851. The morning after the deed was done Morny was made Minister of the Interior. This office he soon resigned, however, and in 1854 he became President of the Corps Législatif, and was Ambassador to Russia during 1856-57, where he married the rich and handsome Princess Troubetzkoi. Morny was created a duke in 1862, and continued his gay and extravagant life up to the time of his death on March 10, 1865. His character was sketched by Alphonse Daudet as the Duc de Mora in *Le nabab*. An extract from his memoirs appeared under the title, *Une ambassade en Russie* (1856). Consult: Castille, *M. de Morny* (Paris, 1859); De la Guernonnière, *Études et portraits politiques* (Paris, 1856); Imbert de Saint-Amand, *The Court of Napoleon III. and the Second Empire* (Eng. trans., New York, 1890).

MORO, mō'rō. A general designation for Mohammedan Malay peoples, with infusion of Semitic blood, living in the southern portions of the Philippines, chiefly in the Sulu Archipelago and the adjoining portions of Mindanao. In the fourteenth century Islam, with Mohammedan culture, reached the islands from Borneo, and its influence was still extending when the Spaniards arrived in 1521. Subdivisions are named Ilano, Joloano, Maguindanao, Samale, etc. See **PHILIPPINE ISLANDS**.

MOROCCO, or **MAROCCO**, mō-rōk'ō, called by the natives *Maghrib-el-Aksa*, 'the extreme west,' or briefly *Maghrib*. An empire or sultanate in the northwest of Africa, bounded on the east by Algeria and on the north and west by the Mediterranean Sea, the Strait of Gibraltar, and the Atlantic Ocean. It extends southward into the Sahara, but the boundary in that direction is not exactly determined (Map: Africa, D 1). The Sultan has considerable influence as far south as the Sakiet-el-Hamra, south of Cape Juby; and the whole of the Dra territory, Taflelt and Tekna, but not Tuat, are conceded to be parts of Morocco. The latest estimate of the area of Morocco is 234,000 square miles.

TOPOGRAPHY. The country is generally mountainous, the Atlas (q.v.) range, which attains an elevation of nearly 15,000 feet, traversing it in several parallel chains from southwest to northeast, and sending out numerous spurs to both the coast-country and the desert. There are, however, many level tracts, especially at the western and eastern extremities, and on the borders of the desert. Through the heart of Northern Morocco extending east and west is a depression, passing just north of Fez, the northern capital,

to Oran, Algeria. The central range of the Atlas forms the water-parting separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former rivers have the shorter course and less volume, but they are perennial; while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief river is the Muluya, with its tributary the Sharef, which drains the northeast of the country, and falls into the Mediterranean after a course of 400 miles. The Muluya is an old waterway of much commercial importance. The Sebu is the most important river of Northwest Morocco draining to the Atlantic. The Kus, Bu-Regreg, Um-er-Rebia, Tensift, Sus, and Assaka drain the central and western districts, and fall into the Atlantic; the Dra, Ziz, Ghir, and other streams irrigate the dry plains of Taflelt, the first mentioned emptying into the Atlantic Ocean. The other rivers are lost in the desert. All the rivers flowing to the sea are obstructed at their mouths by sandbars, which only small vessels can cross at high tide.

CLIMATE. The climate between the central range of the Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the southeastern districts extremes of heat and cold prevail, and rain is there unknown. The entire country is very healthful. Malaria, the pest of the other Atlas lands, is almost unknown. Along the Atlantic coast the winter precipitation is so large that good pasturage is found as far south as Cape Juby. But dryness prevails throughout the Atlas region, though the winter precipitation covers the mountain-tops with snow; this fact, together with the infrequency of wide valleys, makes the mountain region unfavorable for a large population; the settlement among the mountains is confined to the valleys where irrigation is possible, and to the lower slopes. In the Saharan steppes cultivation is impossible, excepting where streams, fed by the mountain snows, bring surface or underground supplies of water.

FLORA. The flora is richer in flowers and shrubs than in trees. The forests that once covered Western Barbary have disappeared and Morocco is largely a treeless country, though some well-wooded valleys are found among the northern ranges. The cedar, walnut, and cork-oak are the principal trees. The date and oil palms, the fig tree, pomegranate, oranges and lemons, apricots, peaches, the almond, and other varieties of fruit and nut trees are all important.

FAUNA. The wild animals include the leopard, bear, hyena, and wild hog. The bustard, partridge, and water fowl abound. The domestic animals comprise the dromedary and the horse, both bred extensively, and mules, asses, cattle, fat-tailed sheep, and goats.

MINERAL RESOURCES. The country is rich in deposits of copper, iron ore, antimony, and rock salt (north of Fez), and gold and silver are reported. The exploitation of all this mineral wealth, however, is hardly to be thought of under the existing conditions on account of the deep aversion of the official classes to foreigners.

AGRICULTURE. Agriculture and stock-raising are almost the only industries. The alluvial soil of the wide plains of the west and east is especially adapted to the cultivation of cereals, and could be brought to a high degree of productiveness by the application of modern agricultural methods. But the strict prohibition of the exportation of grain prevents the natives from utilizing the natural resources of the country and large tracts of fertile land remain idle. Agriculture is also greatly hindered by the general misrule prevailing in the country, and especially the corrupt system of taxation. The chief agricultural products, besides wheat, barley, and other cereals, are olives, dates, oranges, figs, and other kinds of southern fruit, as well as numerous varieties of vegetables. Cotton and sugarcane, once extensively cultivated, have now entirely disappeared, and the cultivation of tobacco is greatly hindered by the adverse sentiment toward its use. The manufacturing industries of Morocco are chiefly devoted to the production of leather, pottery, textiles, including carpets, metal goods of copper and brass, and silver filigree. Fezes are chiefly imported from Austria.

COMMERCE. The chief exports are beans, skins and hides, fruits, olive oil, and wool. The export of grain, horses, cattle, and many other articles is forbidden. Imports include metal products, cotton, sugar, and tea. Purchases of clothing stuffs and metal wares from Europe are constantly increasing. The commerce with Europe is carried on through the ports of Tangier, Tetuan, Larash, Rabat, Mogador, Mazagan, and Safi, all of them, with the exception of Tetuan, situated on the Atlantic. Fez in the north and the city of Morocco in the south are the centres of the interior caravan trade. The commercial statistics of the country are very incomplete, but from the partial returns of most of the Moroccan ports it is estimated that the imports amount to about \$6,000,000 and the exports to about \$5,000,000 a year. The trade would be much smaller were it not that the European Powers have used their joint influence to keep the Atlantic ports open to commerce. Great Britain leads in the trade, with France, Germany, Belgium, and Spain following in the order named. As wagon roads and bridges are unknown, commodities can be moved only at large expense.

GOVERNMENT. In its form of government Morocco presents an example of perfect absolutism. The Sultan is in unrestricted control of both the secular and the religious affairs, but his Cabinet of six ministers has considerable influence in the management of the State. The country is divided into provinces administered by Governors, or 'Kaids,' whose sway is as absolute in the respective provinces as that of the Sultan. In some of these provinces, particularly among the Rif Mountains of the Mediterranean coast, the rule of the Sultan is hardly recognized. The revenue (for which no reliable statistics are available) is derived from monopolies, taxes, tithes, and gifts. The receipts from the tariff on foreign commerce at the seaports are from \$1,500,000 to \$2,000,000 a year. Taxes are collected without any system or control, each taxgatherer being obliged to deliver a certain sum regardless of the amount actually collected. Any reluctance to pay taxes is usually followed by bloody punitive expeditions not infrequently under the personal direction of the Sultan. An im-

partial and well-regulated system of administration of justice is naturally out of the question. The evidence of a Jew or a Christian against a Mohammedan is considered invalid by the native judges. Persons who are under the protection of foreign consuls are exempted from the jurisdiction of native judges. The army of the Sultan consists of about 12,000 drilled men, of whom about 10,000 are infantry. Most of them are usually stationed at that one of the three capitals (Fez, Morocco, or Mekinez) where the Sultan is in residence; European officers are used to drill the army. The militia forces number about 18,000 men, and the number of men available in case of emergency is estimated at about 40,000.

POPULATION. The number of inhabitants is believed to be about 8,000,000. The population consists of Berbers (about 4,000,000), Arabs and Moors (about 3,600,000), Jews (about 150,000), and negroes and mixed blood (about 250,000). The number of Europeans is between 4000 and 5000. The natives, with the exception of the Jews, are Mohammedans of the most fanatical stripe. The capitals are Fez (140,000 estimated), Morocco (50,000), and Mekinez (25,000). The population of Tangier, an important commercial centre and the seat of the foreign consuls, is estimated at 30,000.

HISTORY. Morocco was the Roman Province of Mauretania Tingitana, and shared in the vicissitudes of the other Roman provinces of Northern Africa during the decline of the Empire. It was reached by the tide of Arabian Mohammedan invasion in 698 and was reduced to submission and to Mohammedanism after a spirited resistance. Its people participated in the conquest of Spain. For a number of centuries its history is the rise and fall of successive dynasties, of which the most celebrated were the Almoravides and the Almohades (q.v.), who passed over into Spain and established their power in that country. In fact, during the later Middle Ages Morocco was the source whence new reinforcements were constantly drawn for the declining power of the Moors in Spain. After the fall of Granada in 1492 the population of Morocco was reinforced by Moors expelled from the Peninsula. In 1546 the sherifs of Tafillet conquered both Morocco proper and Fez, and united the whole country under one government. This is the present ruling dynasty, claiming direct descent from Ali, son-in-law of Mohammed. In the sixteenth century Morocco was compelled to meet attacks by Spain and Portugal. In 1578 Sebastian, King of Portugal, was defeated and slain in the battle of Kasr-el-Kebir (Alcazarquivir). In the middle of the seventeenth century the Empire of Morocco embraced part of the present Algeria, and extended south as far as Guinea. From that time, however, its decline has been almost unchecked. Morocco has had as little as possible to do with the outside world. Since the commencement of the nineteenth century the rebellion of the wild mountain tribes, the wars of the French in Algeria, and difficulties with foreign States, caused by the aggressions of the Rif pirates, have occupied the attention of the sultans. In 1814, under pressure from the Christian nations, the slavery of Christians was abolished; and in 1817 piracy was prohibited throughout Morocco. The Sultan Abderrahman, having espoused the cause of Abd-el-Kader, sustained a

crushing defeat at the hands of the French at Isly in 1844. Mogador was bombarded and peace soon followed. In 1859 a Spanish force under Marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan was taken. A treaty was signed April 27, 1860, by which the Sultan ceded some portions of his territory and granted commercial privileges to Spanish merchants. Since that time the history of Morocco has been externally uneventful; but the steady weakening of the Sultan's power has made future complications with foreign States not unlikely. Local revolts in 1892 nearly led to the intervention of the Powers, but mutual distrust still keeps them in check. Mulai Hassan, who became Sultan in 1873, died in 1894, and was succeeded by his son, Mulai Abd-el-Aziz, born February 24, 1878. The young Sultan was the son of a Circassian slave and had received an excellent education, which served to imbue him with a fondness for Western civilization. The Government, however, was in the hands of the powerful Grand Vizier, Sidi-Ahmed ibn-Musa, who left little opportunity for the Sultan to put his ideas into effect. After the Vizier's death, in May, 1900, Mulai Abd-el-Aziz assumed personal charge of the Government, and almost immediately entered upon a series of reforms looking toward the reconstruction of Morocco on something of a European basis. The improvement of the State prisons, which had become mere plague spots where atrocious cruelties were practiced on the prisoners, first received his attention. He also set about reducing the onerous customs duties which were levied on goods, especially food products, carried from port to port within the Empire. European influence was welcomed at the capital, British interests being especially favored. The mass of the population regarded the progressive policy of their sovereign with great dissatisfaction, and the introduction of such Western innovations as the railway and the automobile aroused profound disgust. A growing spirit of hatred for foreigners speedily asserted itself. In October, 1902, an English missionary was murdered by a fanatic in Fez and on the murderer's seeking refuge in a mosque, the Sultan caused him to be seized and punished, an act which was regarded by the Moslems as a breach of sanctuary and served to stir up further dissatisfaction. A formidable insurrection among the Berber tribes broke out late in 1902 under the leadership of one Omar Zarabuni, known also as Bu Hamara or Son of the She Ass. He proclaimed himself an elder brother of the Sultan and succeeded in rallying around him the tribes between Fez and Mekinez. Unchecked by several reverses, he succeeded finally in defeating the royal troops under a brother of the Sultan (November 29th), and toward the end of December made himself master of the country around Fez. In January, 1903, the capital was invested by the forces of Bu Hamara.

MOROCCO, or MAROCCO. One of the capitals of the Sultanate of Morocco. It is situated on the north slope of the Great Atlas Range, 90 miles from the Atlantic coast and 250 miles southwest of Fez (Map: Africa, D 1). Its location is very favorable. The city has a healthful climate, but is in a very backward and dilapidated condition. It covers a large area, surrounded by high walls, now more or less in ruins. A large part of the space within is occupied by gardens, open areas, and market places, but in the built-up portions the streets are narrow, crooked, and dirty, and the houses are ill-kept, one-storied, lime-and-earth buildings, with unglazed window-openings. There are nineteen mosques in the city. The Imperial Palace comprises an irregular conglomeration of buildings and gardens in the southern part of the city, covering 180 acres, and surrounded by a wall. Of late years it is but seldom visited by the Sultan. The industries of the city are unimportant. There is still considerable local trade carried on with the surrounding country and with the port of Mogador (q.v.). Traffic is largely in the hands of the Jews, who number about 7000, but live under repressive conditions in a separate quarter of the city. The entire population is estimated at 50,000 to 60,000. There are no permanent European residents. Morocco was founded about 1072. It reached the height of its prosperity in the thirteenth and fourteenth centuries, when its population is said to have been 700,000. It was then a famous Mohammedan seat of learning. Its decline was brought about by several centuries of civil wars and rebellions.

MORÓN, or MORÓN DE LA FRONTERA, mōrōn' dā lá frōn-tā'rá. A town of Southern Spain, in the Province of Seville, 32 miles southeast of the city of that name, on the Guadaira (Map: Spain, C 4). On one of the high and steep hills surrounding the town are the remains of a once almost impregnable castle erected by the Moors on Roman foundations, and surrounded by triple walls and towers. The castle was occupied by the French in 1810, and was blown up by them on their departure. The inhabitants are engaged in the production of olive oil, and in the vicinity are marble quarries and mines of red hematite. Population, in 1900, 14,459.

MORONG. A town of Central Luzon, Philippines, in the Province of Rizal (Map: Philippine Islands, F 5). It is situated on the north shore of the Laguna de Bay, 17 miles east-southeast of

Manila, and has a population of 9430. It was the capital of the former Province of Mórong.

MORONG, THOMAS (1827-94). An American botanist, born at Cahaba, Ala. The family removed to Massachusetts while he was a boy, and he graduated at Amherst in 1848. He studied law, but later entered Andover Theological Seminary, and completed his studies in 1853. During his early life he was devoted to botany as an amateur; and in 1888 he undertook an extended voyage of exploration and botanical collection in South America, and visited Argentina, Paraguay, and Chile. Upon his return, in 1890, he was made curator of the herbarium of Columbia College, in New York City. In conjunction with Dr. N. L. Britton he published *An Enumeration of the Plants Collected by Dr. Thomas Morong in Paraguay, 1888-90*. He was one of the contributors to the *International Encyclopædia*.

MORONI, mò-rò-né, or MORONE, GIAMBATISTA (c.1525-78). An Italian portrait painter, born at Albino, near Bergamo. He was a pupil of Moretto, and became one of the most noted portraitists of the Venetian school. He passed his life in and about Bergamo. In the Uffizi Gallery in Florence there are five portraits by him, including one of himself. The National Gallery in London has several of his works, including his masterpiece, the portrait of a tailor. His altarpieces are of less value.

MOROSINI, mò-rò-zé-né, originally MOROSI. A family of Venetian nobles, dating from the eighth century. Four of the family became doges and many of them occupied other public positions. The first celebrated member of the family was DOMENICO MOROSINI, who was Doge from 1148 to 1156.—MARINO MOROSINI, who was Doge from 1249 to 1252, introduced the Inquisition into Venice.—MICHELE MOROSINI was Doge for less than a year (1382). He was celebrated as a financier.—ANDREA MOROSINI (1558-1618) became historiographer of the Republic (1598), and held several public offices, besides being one of the Council of Ten. He wrote a history of Venice from 1521 to 1615, first published in 1623, and *Imprese ed espedizioni di Terra Santa e l'acquisto fatto dell' imperio di Constantinopoli dalla repubblica di Venezia* (1627), a history of the Fourth Crusade. His other works have not been edited.—FRANCESCO MOROSINI (1618-94) gallantly but unsuccessfully defended the fortress of Candia against the Turks in 1667-69. About 20 years later he conquered nearly all of the Morea, which gained him the surname of *il Peloponnesiaco*. He was elected Doge in 1688. Consult: Morosini, *Francesco Morosini il Peloponnesiaco* (Venice, 1885); Bruzzo, *F. Morosini nella guerra di Candia e nella conquista di Morea* (Forlì, 1890).

MOROT, mò-rò', AIMÉ NICOLAS (1850—). A French painter, born at Nancy. He studied under Cabanel, and at the Ecole des Beaux-Arts, where he was awarded the Prix de Rome in 1873. His pictures, mainly historical subjects and portraits, are notable in color and composition. One of the best of them, "La bataille de Reichshofen" (1887), is in the Luxembourg.

MOROTOCO, mò-rò-tò-kò. One of a group of sedentary agricultural tribes residing about the Oxuquis River, on the border of the Chaco region, in Southeastern Bolivia. The entire group con-

stitutes a distinct linguistic stock, the *Samuouan*. Their language is singularly musical. The Morotoco are remarkable in being apparently ruled by the women. The men do the household drudgery, although they are tall and robust, and daring hunters. The women refuse to have more than two children, strangling any born above that number.

MORPETH. A market-town and municipal borough in Northumberland, England, on the Wansbeck, 15 miles north of Newcastle (Map: England, E 1). The principal buildings are the parish church, the free grammar school of Edward VI., founded in 1552, and the town hall, erected by Sir John Vanbrugh. The town owns remunerative property, the markets, and provides a free water supply. It has flannel manufactures, iron foundries, collieries, and quarries. There are remains of a castle and gateway. Morpeth was a Saxon town of importance before the Conquest, and was granted corporate privileges by Charles II. Population, in 1891, 5200; in 1901, 6150.

MORPHEUS, mò-r'fús (Lat., from Gk. *μορφή*, shaper, fashioner). In classic mythology, the son of Somnus (Sleep), because he shapes or molds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapor out of a horn.

MORPHINE, or MORPHIA (from Lat. *Morpheus*, god of dreams), $C_7H_7NO + H_2O$. The most important of the eighteen alkaloids existing in opium, of which it constitutes one-eighth to one-sixteenth by weight. It was first isolated in 1816 by Sertürner, a chemist of Hanover. It occurs in combination with meconic and sometimes sulphuric acid, as colorless, shining, prismatic crystals, odorless, and having a bitter taste. It is soluble in 1000 parts of cold and in 400 parts of boiling water; in 20 parts of cold and in 13 parts of boiling alcohol. It is less soluble in ether and chloroform. The following are the ordinary tests for morphine: Concentrated nitric acid when applied to morphine or its salts gives an orange color, changing to yellow; when it is mixed with iodic acid iodine is liberated, which may be recognized by the well-known starch test; a neutral solution of a morphine salt produces a blue color with a neutral solution of ferric chloride.

Morphine is the only opium alkaloid soluble in lime water, and this property affords one of the best means of extracting it. Morphine combines with acids to form crystallizable salts, which are readily soluble in water and alcohol. Of these the sulphate hydrochlorate (or muriate) and acetate are used in medicine. Apomorphine (q.v.), a powerful emetic, is prepared by heating morphine for some hours with an excess of hydrochloric acid.

The therapeutic uses of morphine and its salts are similar to those of opium (q.v.), but morphine acts more certainly and quickly and is more readily absorbed than opium, is more suitable for hypodermic use, and is less apt to constipate and cause gastric disturbances. The ordinary dose for an adult is from one-eighth to one-half a grain.

The habitual taking of morphine is not uncommon. Those addicted to this habit become dependent for a comfortable existence on the drug, and gradually increase the dose until enormous

amounts are taken. Their wills become utterly destroyed and their moral sense, especially in regard to truth, lost. The bodily functions are depressed, digestion disordered, and the individual becomes pale, sallow, and emaciated. Finally there is obstinate sleeplessness, a violent diarrhœa, and cramps in the muscles. The habit can be effectually treated only in institutions where the patient can be kept under constant surveillance. See OPIUM.

MORPHOGENESIS (Neo-Lat., from Gk. *μορφή*, *morphê*, form + *γένεσις*, *genesis*, origin, from *γίγνεσθαι*, *gignesthai*, to become). A term proposed by Haeckel, who divides morphology into the two coördinated branches of anatomy and morphogenesis or morphogeny. Morphogenesis is the equivalent of embryology or developmental history. It takes into account the gradual development and building up of the form of the adult; i.e. the series of changes and the mode by which the body and its organs become shaped. Haeckel further subdivides morphogenesis into ontogeny (q.v.) and phylogeny (q.v.). Consult Haeckel, *Generelle Morphologie* (Berlin, 1866).

MORPHOLOGY (from Gk. *μορφή*, *morphê*, form + *λογία*, *-logia*, account, from *λέγω*, *legein*, to say). In zoölogy, the science of form and structure of animals. It is based on comparative anatomy and embryology, and lays the foundation for physiology. We cannot well understand the structure or anatomy of the fully grown animal unless we have the history of the development of the organism as a whole, and of the separate organs. The morphologist, whose methods of study are based on observation and comparison, must not only be a comparative anatomist, but also an embryologist. He should not only be acquainted with the individual development (ontogeny, q.v.), but also that of the class or phylum to which the organism belongs (phylogeny, q.v.). Moreover, as the existing living beings are the descendants of long lines of ancestry, the morphologist should have at his command all the available facts as to the fossil relatives of existing forms. Though we owe the word 'morphology' to Goethe, it was first brought into its present extended use by the zoölogists J. Müller and Leuckart. But long before the middle of the last century the general morphology of organisms was in part discussed by Oken, Carus, Goethe, Geoffroy Saint Hilaire, Lamarck, Cuvier, Savigny, Owen, and Agassiz. For example, Goethe compared the flowering plant to an axis bearing modified or metamorphosed parts or leaves; Savigny discovered that the mouth-parts or appendages of the heads of insects were modified legs; and Carus, Audouin, and Strauss-Durckheim perceived that their head was composed of a number of segments. Goethe, and also Oken, discovered the segmental nature of the vertebrate skull, a problem still earnestly discussed by morphologists. That portion of the history of zoölogy called the Period of Morphology was signalized by the brilliant results in developmental work of Von Baer, Pander, J. Müller, Rathke, followed by the later researches of Schwann, Schleiden, Koelliker, Huxley, Vogt, Gegenbaur, Haeckel, and their followers. As the result we see numerous morphological problems either solved or in a fair way of solution. See SYMMETRY.

BIBLIOGRAPHY. Spencer, *Principles of Biology*

(New York, 1898-1900); Leuckart, *Ueber die Morphologie und die Verwandtschaftsverhältnisse der wirbellosen Thiere* (Braunschweig, 1848); Gegenbaur, *Elements of Comparative Anatomy* (Eng. trans. London, 1878); Haeckel, *Generelle Morphologie* (Leipzig, 1866); Carus, *Geschichte der Zoologie* (Munich, 1872); His, *Unsere Körperform* (1875); also the works of Oken, Cuvier, Owen, Agassiz, Huxley, O. and R. Hertwig, and others.

MORPHOLOGY (in Plants). The study which treats of the origin and structure of plants and their organs. The aims of plant morphology are in all respects the same as those of animal morphology. (See BOTANY.) The best conception of the present condition of plant morphology may be obtained by reading the general articles on BRYOPHYTES; PTERIDOPHYTES; SPERMATOPHYTES; THALLOPHYTES; and the more special articles on ALGÆ; ANGIOSPERMS; Equisetum; Fern; FUNGI; GYMNASPERMS; HEPATICÆ; LYCOPODIALES; and MUSCI. A still more detailed account of plant structures may be obtained from the separate titles which deal with the prominent phenomena and organs, such as ALTERNATION OF GENERATIONS; ANTHEIDIUM; ARCHEGONIUM; HETEROSPORY; LEAF; ROOT; SEED; SPORE; STEM.

BIBLIOGRAPHY. Among elementary works that treat of the modern aspects of morphology are the following: Atkinson, *Elementary Botany* (New York, 1898); Barnes, *Plant Life* (New York, 1898); Bessey, *Botany* (New York, 1892); Campbell, *Structural and Systematic Botany* (Boston, 1890); id., *The Evolution of Plants* (New York, 1899); Coulter, *Plant Structures* (New York, 1899). More advanced works are as follows: Goebel, *Outlines of Classification and Special Morphology*, trans. by Garnsey (Oxford, 1887); Strasburger, Noll, Schenck, and Schimper, *A Text-Book of Botany*, trans. by Porter (New York, 1898); Vines, *Student's Text-Book of Botany* (New York, 1895); Warming and Potter, *Handbook of Systematic Botany* (New York, 1895).

MORPHOTROPISM (from Gk. *μορφή*, *morphê*, form + *τροπή*, *trōpê*, a turning, from *τρέπω*, *trepein*, to turn). The study of the exact rôle which each chemical constituent or each atomic (radical) group of a substance plays in modifying the form of its crystals. By comparing the crystal forms of a series of closely related substances, the part played by each constituent substance may be inferred, especially when the substitution methods of organic chemistry are applied to substances having very large chemical molecules. See CRYSTALLOGRAPHY.

MORPHY, PAUL CHARLES (1837-84). An American chess player, born in New Orleans, La. He was remarkably precocious, especially as a chess player, and before he was thirteen had defeated many well-known amateurs. He studied law for several years at the College of South Carolina, playing chess only occasionally. At the first American Chess Congress, which assembled in New York in 1857, Morphy defeated with ease the best players that could be brought to meet him. He visited Europe in 1858, and in England beat Löwenthal, Boden, and Bird, and performed the most astonishing feats in simultaneous games without the board. In Paris he won five out of eight games with Harrwitz, and

continued his exhibitions of blindfold playing. After his return to the United States, in 1859, he won seven out of eleven games with the visiting German expert Andersen. He was admitted to the bar, and began the practice of law in New Orleans. The strain occasioned by his blindfold contests, however, had been too great for his mental faculties, and, though he abandoned chess altogether, he was soon forced to relinquish all mental occupation, and died in retirement. During the comparatively short period of his activity Morphy displayed a skill that was inexplicable. He was at no time a close student of chess and he played without preparation and with little hesitation; but an analysis of his games reveals combinations remarkable for finesse, depth, elegance, and soundness. These qualities, combined with a wonderful memory, made him perhaps the most remarkable chess player in modern times. Consult Löwenthal, *Morphy's Games of Chess* (London, 1860).

MORRILL, JUSTIN SMITH (1810-98). An eminent American legislator and political leader. He was born in Strafford, Vt., received a common school education, became a clerk in a country store at the age of fifteen, and until 1855 was largely engaged in mercantile pursuits, though he devoted much of his time to private study. He entered the National House of Representatives in 1854, was five times reelected, was transferred to the Senate in 1867, and retained his seat continuously until his death, having at that time served in Congress for a longer consecutive period than any other man in the history of the United States. During the latter part of his service in the House, he was the leading member of the Committee on Ways and Means, and chairman of the Sub-Committee on Tariff and Taxation, and in the Senate he was a member after 1867 and chairman for many years of the Committee on Finance, and was also at various times a member of the Committee on Public Buildings and Grounds, on Education and Labor, on the Census, and on Revolutionary Claims. He made many able speeches which attracted wide attention, and had much influence both in and out of Congress, but he will be remembered chiefly for his connection with two significant and important measures. In 1857 he introduced a bill for the establishment, through the aid of public land grants, of State colleges throughout the country primarily for the purpose of teaching agriculture and the mechanic arts, other subjects, however, not to be excluded. This bill was passed by both House and Senate, but was vetoed by President Buchanan. In 1861 it was again introduced by Morrill, was again passed, and this time became a law through the signature of President Lincoln. In 1890 Senator Morrill introduced a bill providing an additional grant for this purpose, which also was passed by both Houses and signed by the President. By virtue of these enactments there had been established by 1899, in the various States, sixty-four institutions giving instruction to 36,000 students. Morrill framed and introduced in the House the famous Morrill Tariff Act of 1861, which, with the enactments of 1862 and 1864, in the passage of which he also took a prominent part, modified the tariff system of the United States. (See **TARIFF**.) Morrill was also conspicuous as an

energetic opponent of Government paper money and especially of the Legal Tender Act of 1861-62, and of the annexation to the United States of outlying territory, such as Santo Domingo, Saint Thomas, Hawaii, Porto Rico, and the Philippines. He published *The Self-Consciousness of Noted Men* (Boston, 1886).

MORRILL, LOT MYRICK (1813-83). An American legislator and Cabinet officer, born at Belgrade, Maine. He entered Waterville College (now Colby University) in 1833, but left before graduating to enter a law office at Readfield. In 1837 he was admitted to the bar, and for several years practiced in partnership with Timothy O. Howe. In 1841 he removed to Augusta, where he won wide distinction as a lawyer and public speaker. Although strongly opposed to the extension of slavery, he was in all other matters in perfect agreement with the Democratic Party, and became one of the leaders of the Maine Democracy. In 1853 and 1854 he was elected to the Lower House of the State Legislature, and in 1856 was elected to the State Senate. After Buchanan's nomination, disapproving of his party's platform, he resigned from the Democratic State Committee, and allied himself with the Republican Party. He was elected Governor of the State by that party in 1857, and was reelected in 1858 and 1859. In 1861 he was chosen United States Senator to succeed Hannibal Hamlin. Reelected for a full term in 1863, he was defeated by a single vote in 1868 by Hamlin, but in the following year was elected to succeed William P. Fessenden. In 1876 he resigned to enter the Cabinet of President Grant as Secretary of the Treasury. This portfolio he held until after the inauguration of President Hayes, when he became Collector of Customs at Portland, Maine.

MORRILLTON. A city and the county-seat of Conway County, Ark., 50 miles northwest of Little Rock; on the Arkansas River, and on a branch of the Saint Louis, Iron Mountain and Southern Railroad (Map: Arkansas, C 2). It has a trade in cotton and live stock, and manufactures of cottonseed oil, woollens, machine shop products, lumber, furniture, etc. Population, in 1890, 1844; in 1900, 1707.

MORRIS. A city and the county-seat of Grundy County, Ill., 62 miles southwest of Chicago; on the Illinois River, the Illinois and Michigan Canal, and the Chicago, Rock Island and Pacific Railroad (Map: Illinois, D 2). It has Saint Angela's Academy, a Roman Catholic institution for women. The city is the centre of a considerable trade in grain and cattle, and there are mines of bituminous coal, and manufacturing of oatmeal, hardware, paper car wheels, leather, bricks, and tile. The water-works are owned by the municipality. Morris was settled in 1834 and incorporated first in 1857. Population, in 1890, 3653; in 1900, 4273.

MORRIS. A village and the county-seat of Stevens County, Minn., 157 miles west by north of Saint Paul; on the Northern Pacific and the Great Northern railroads (Map: Minnesota, C 5). It is near the Pomme de Terre River, which furnishes good water power. It is in a fertile agricultural region, and has several grain elevators and flour mills. There is a public library. Population, in 1890, 1266; in 1900, 1934.

MORRIS, ALEXANDER (1826-90). A Canadian statesman, born at Perth, Ontario. He studied in Scotland at Saint Andrew's and Glasgow University, graduated at McGill University, Montreal, and was called to the bar in 1851. In 1861 he was elected Conservative member from South Lanark, in 1869 was made Minister of Inland Revenue, and later was Chief Justice of the Court of Queen's Bench in Manitoba (1872-77). He was elected to the Ontario Legislature (1878) as member for East Toronto. He was a strong advocate of the confederation of the provinces, and the author of *Treaties of Canada with the Indians of the Northwest* (1880); *Nova Britannia* (1884); and *Canada and Her Resources* (1885).

MORRIS, BENJAMIN WISTAR (1819—). An American clergyman. He was born at Wellsboro, Pa., graduated from the General Theological Seminary in 1846, receiving that year the ordination of deacon of the Protestant Episcopal Church, and the following year was ordained priest. He was stationed as rector at Sunbury, Manayunk, and Germantown, all in Pennsylvania. In 1868 he was consecrated Bishop of Oregon and Washington, his diocese subsequently being restricted to the former State. During his incumbency he has actively advanced the educational and philanthropic interests of his diocese, being instrumental in establishing Saint Helen's Hall, a boarding and day school for girls, the Bishop Scott Academy, and the Good Samaritan Hospital in Portland. He is the author of *Presbyterian, Baptist, and Methodist Testimony to Confirmation* (1860).

MORRIS, CHARLES (1745-1838). An English song-writer of Welsh origin. He was reared by his mother, went to America in the 17th foot in 1764, and on his return to England he was for many years punch-maker and bard of the famous Beef Steak Club, a convivial society founded in 1735. He associated with the party of Fox, for which he wrote many political songs, as "Billy Pitt and the Farmer." Neglected by his Whig friends, he composed the lament, "The Old Whig Poet to His Buff Waistcoat." The French song-writer Béranger also wrote a charming ditty on an old coat of his, but quite unlike that by Morris. Morris met the Prince of Wales and was a frequent guest at Carlton House, where he was known as "The Sun of the Table." Among his best known pieces are: "The Town and the Country;" "A Reason Fair to Fill My Glass;" "The Triumph of Venus;" and "Ad Poculum." The Prince granted him an annuity of £200; and the Beef Steak Club gave him a villa near Dorking, where he passed his last years, living to be ninety-three. His songs were gathered under the title *Lyra Urbana* (1840; 2d ed. 1844).

MORRIS, CHARLES (1784-1856). An American naval officer, born in Woodstock, Conn. He entered the United States Navy in 1799, took an active part in the war with Tripoli, and in the famous recapture of the *Philadelphia* (1804) in the harbor of Tripoli was the first of the boarders to reach the deck of that vessel. When the War of 1812 broke out he was executive officer of the *Constitution*, and in the engagement between that vessel and the *Guerrière* was wounded. He received command of the frigate *John Adams*, and after a successful cruise was blockaded in the Penobscot River by an English fleet and forced

to destroy his vessel to prevent her capture. He commanded the *Congress* in the war with Algiers, and in 1825 carried Lafayette back to France in the *Brandywine*. He was for years naval commissioner, for a considerable time supervisor of the Naval Academy at Annapolis, and at his death, in 1856, was chief of the Bureau of Ordnance and Hydrography. Consult his *Autobiography* (Annapolis, 1880).

MORRIS, CHARLES D'URBAN (1827-86). An American classical philologist and educator, born in Charmouth, Dorset. His grandmother was Mary Philipse Morris (q.v.). He was educated at Worcester College, Oxford, and after three years as a scholar at Lincoln College, was a fellow of Oriel (1851-54). In 1853 he came to New York, was rector of Trinity School until 1856, and then founded the Mohegan School, near Peekskill. From the University of the City of New York he went in 1876 to Johns Hopkins as collegiate professor of Latin and Greek. His publications, which are marked by many original pedagogical methods, are: *A Compendious Grammar of Attic Greek* (1869; 4th ed. 1876); a *Latin Grammar* (1870; 4th ed. 1876); and several Latin and Greek primers and readers.

MORRIS, CLARA (1849?—). An American actress, especially noted for her success in the interpretation of 'emotional' roles. She was born in Toronto, Canada (her real name being Morrison), but was reared in Cleveland, Ohio, where at the Academy of Music she became a member of the ballet and afterwards leading actress. Later she played in Cincinnati. She came to New York in 1870 as a member of Daly's company. In 1872 she made a sensation in *L'Article 47*. Conspicuous among her subsequent successes were those won in *Alize* (1873), *Camille* (1874), and *Miss Multon* (Union Square Theatre, 1876), and she soon became well known as a star whose acting was distinguished for spontaneity and naturalness. She was married to F. C. Harriott in 1874. About 1885 she began to devote herself mainly to literary work, among her publications being: *Little Jim Crow, and Other Stories of Children* (1899); *A Silent Singer* (1899); *Life on the Stage: My Personal Experiences and Recollections* (1901); *A Pasteboard Crown* (1902); *Stage Confidences* (1902). Consult McKay and Wingate, *Famous American Actors of To-day* (New York, 1898); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (ib., 1886).

MORRIS, DINAH. In George Eliot's *Adam Bede*, the character which really becomes the centre of interest for the novel. The book was suggested by, and the character partly drawn from, the author's aunt, who, like Dinah, was a Methodist evangelist; but the prominence which the character assumes is due to the criticism of Lewes. Sir Leslie Stephen calls it "not only an elaborate but a most skillful and loving portrait of a beautiful soul."

MORRIS, EDWARD JOY (1815-81). An American diplomat and translator, born in Philadelphia. He graduated at Harvard in 1836, and began the practice of the law in Philadelphia. He was a member of the Pennsylvania State Assembly in 1841-43, and in November, 1842, was elected as a Whig to the Twenty-eighth Congress, serving from 1843 to 1845. From 1850 to 1854 he was chargé d'affaires for the United

States at Naples. After his return he took a leading part in the movement for the organization of the Republican Party in Pennsylvania, and in 1856 was elected to Congress by that party, serving from 1857 to 1861. From 1861 to 1870 he was United States Minister to Turkey. He was a frequent contributor to American magazines for many years, and published *Notes of a Tour Through Turkey, Greece, Egypt, and Arabia Petræa to the Holy Land* (2 vols., 1842). He translated with copious notes and additions *The Turkish Empire, Social and Political* (1854), from the German of Alfred de Besse. He also translated Theodore Mûgge's *Afræja, or Life and Love in Norway* (1854), and Ferdinand Gregorovius's *Corsica, Picturesque, Historical, and Social* (1856).

MORRIS, EDWARD PARMELEE (1853—). An American Latinist. He was born at Auburn, N. Y., graduated at Yale in 1874, and afterwards studied at the universities of Leipzig and Jena. He was professor of Greek at Drury College (1879-84), professor of Latin, Williams College (1885-91), and in the latter year he was appointed to the same position in Yale University. He was editor of Plautus's *Mostellaria* (1880), *Pseudolus* (1890), and *Captives and Trinummus* (1898); also the author of various philological monographs and reviews and *On Principles and Methods in Latin Syntax* (1902).

MORRIS, GEORGE POPE (1802-64). An American journalist and poet, born in Philadelphia. He founded with Samuel Woodworth (q.v.) in New York *The Mirror* (1823-42), a literary weekly, which became *The New Mirror*, and *The Evening Mirror*. In these journals appeared much early work of Bryant, Halleck, Poe, Paulding, Willis, Hoffman, and others, making these periodicals important elements in the literary development of the time. Morris also founded *The National Press* (1845), out of which was developed *The Home Journal* (1846), in which Willis, who had long been associated with Morris, again collaborated. His drama *Briarcliff* (1825) was a popular success. His *Poems*, collected for the last time in 1860, contained the familiar ballads, "Woodman, Spare That Tree" (founded on a real incident), "My Mother's Bible," "We Were Boys Together," and "A Long Time Ago." He also published a number of prose sketches and was prominent in the New York militia. Morris died in New York, July 6, 1864.

MORRIS, GEORGE SYLVESTER (1840-89). An American educator and philosophical writer, born at Norwich, Vt. He graduated in 1861 at Dartmouth, served in the Federal Army during the first two years of the Civil War, and was a tutor at Dartmouth in 1863-64. After spending several years abroad in the study of philosophy and theology, he was appointed, in 1870, professor of modern languages and literature in the University of Michigan, and in 1881 professor of logic, ethics, and the history of philosophy there. From 1878 to 1885 he also lectured on ethics and the history of philosophy at Johns Hopkins University. He translated Ueberweg's *History of Philosophy* (1871); edited Grægg's *Philosophical Classics*; and wrote *Kant's Critique of Pure Reason: A Critical Exposition* (1882); *Philosophy and Christianity* (1883); and *Hegel's Philosophy of the State and of History* (1887).

MORRIS, GEORGE UPHAM (1830-75). An American naval officer, born in Massachusetts. He entered the navy in 1846, was commissioned lieutenant in 1855, and still held that rank when Commander William Radford's absence on March 8, 1862, left him the senior officer on the *Cumberland* during its battle with the Confederate ram *Merrimac*. Lieutenant Morris's gallantry in fighting his ship until she sank with her flags still flying aroused the greatest enthusiasm in the North, and earned his promotion to the grade of lieutenant-commander, July 16, 1862, a rank which he held until 1866, when he was commissioned commander.

MORRIS, GOUVERNEUR (1752-1816). An American statesman and diplomat. He was born at Morrisania, N. Y., January 31, 1752, and graduated at King's (now Columbia) College in 1768. He studied law and was admitted to the bar in 1771. In 1775 he was chosen to represent Westchester County in the first Provincial Congress of New York, and took a prominent part in the advocacy of the American cause. He served in two succeeding Congresses in the same and the following year. He was one of the recognized leaders of the Congresses; served on nearly all the important committees, among them the committee that drafted the Constitution of the State of New York; and with Jay and Livingston had much to do with framing the plan of government for the State. In 1777, when only twenty-five years of age, he was elected to the Continental Congress, in which he served until 1780. Immediately upon taking his seat he was appointed on a committee to investigate the condition of the army at Valley Forge, and afterwards devoted his energies to securing the adoption by Congress of Washington's plans for the organization and pay of the army. His ability won for him the chairmanship of the committee to confer with the British commissioners on reconciliation who arrived in 1778. As chairman of the committee to publish an address to the people of the colonies on the existing condition of affairs, he drew up a masterly account of the causes of the war, the efforts that had been made to achieve independence, and the transactions with the British commissioners. The address was entitled *Observations on the American Revolution*. In 1779 he was chairman of three other important committees and performed the whole duties of each. During his career in Congress Morris drew up several reports and papers on finance which showed evidence of marked ability. His services were recognized by his appointment as assistant superintendent of finance in 1781, a position which he held with great credit until 1785. It was in this capacity that he drew up a scheme for a system of coinage which, though not adopted at the time, ultimately became the basis of our present system. He represented Pennsylvania in the Constitutional Convention of 1787 at Philadelphia; took a leading part in the debates of that body, and the published proceedings showed that he made more speeches than any other member, always championing a strong national government. He urged the proportional representation of the States in the Senate, and favored a freehold suffrage, a good behavior tenure for the executive, and representation in Congress apportioned according to the number of free inhabitants. In 1789 Morris went to France on private

business, and was in Paris at the outbreak of the French Revolution. He kept a diary during his stay, and wrote letters which threw much light on the character of the events which he witnessed. In 1790 he went to London as private agent to the British Government to conduct negotiations regarding the unfulfilled stipulations of the treaty of 1783. His mission was not successful, and he again returned to the Continent. In 1792, while still in Europe, he was appointed Minister to France, and served in that capacity during the stormy scenes of the two ensuing years. In 1794 the French Government requested and obtained his recall. He remained in Europe until 1798. In 1800 he was elected from New York to the United States Senate, where he acted with the Federalists. After his retirement from the Senate in 1803 he took great interest in the Erie Canal project, and served as chairman of the Canal Commission from 1810 to the time of his death, which occurred November 6, 1816. His biography has been written for the "American Statesmen Series" by Theodore Roosevelt (Boston, 1900). An elaborate biography was prepared by Jared Sparks (3 vols., Boston, 1832). Morris's diary and letters have been published in two volumes (New York, 1888).

MORRIS, HENRY W. (1806-63). An American naval officer. He was born in New York City, entered the United States Navy in 1819, and became a captain in 1856. For some time after the outbreak of the Civil War he was in Washington superintending the construction of the *Pensacola*, which vessel, when completed in January, 1862, he took safely by the Confederate batteries on the Potomac. He then joined the Federal blockading squadron in the Gulf of Mexico, distinguishing himself in the attacks upon Forts Jackson and Saint Philip, and after the capture of New Orleans was in command for a short time of the squadron stationed there. He was made commander in July, 1862. His health giving way, he went to New York, where soon afterwards he died.

MORRIS, JOHN GOTTLIEB (1803-95). An American clergyman, born at York, Pa. He graduated at Dickinson College in 1823, then studied theology at Princeton and at Gettysburg Seminary, and in 1827 was licensed as a preacher. In the same year he went to Baltimore, where he founded the Trinity English Lutheran Church, of which he continued to be pastor until 1860, when he became librarian of the Peabody Institute. In 1864 he became pastor of the Third English Lutheran Church, and in 1874 accepted a call to Lutherville, Md., where he was actively interested in the founding of the College for Women. He held a number of academic positions, founded the Lutheran Historical Society, presided over the General Synod in 1843 and in 1883, contributed frequently to scientific and religious journals, edited the *Lutheran Observer* (1823-34), and wrote a number of books, among which may be mentioned *Life of John Arndt* (1853); *Life of Catherine de Bora* (1856); *Quaint Sayings and Doings Concerning Luther* (1859); and *Fifty Years in the Lutheran Ministry* (1878).

MORRIS, JOHN THOMAS (1826—). An English Jesuit. He was born at Ootacamund, Madras, India; entered Trinity College, Cam-

bridge, where he became a Roman Catholic; completed his education in the English college at Rome, and was ordained to the priesthood. After passing three years in the diocese of Northampton he returned to Rome and became vice-rector of the English college. At the end of three years he went back to England, where he was appointed canon residentiary of the London Chapter. He also acted as private secretary to Cardinal Wiseman and his successor, Cardinal Manning. In 1867 he became a member of the Society of Jesus. He was for a time rector of a Jesuit college in Malta, professor of canon law and Church history in Saint Bruno's College near Saint Asaph, and from 1879 rector and master of novices at Roehampton. He published a *Life of Saint Thomas of Canterbury* (1860; 2d ed. 1885); *Condition of Catholics Under James I.* (1871); *The Troubles of Our Catholic Forefathers* (1875); *The Letter-books of Sir Amias Paulet* (1874); and *Cardinal Wiseman's Last Illness* (1871).

MORRIS, LEWIS (1671-1746). An American colonial Governor. He was born on Manhattan Island, the son of Richard Morris, an officer of Cromwell's army, who had emigrated to the West Indies after the Restoration and a few years later purchased a tract of 3000 acres of land on the west side of Manhattan Island, in the region later named Morrisania, after his family. Lewis Morris was well educated by private tutors, studied law, and after several years' practice was appointed a judge of the Superior Court in East Jersey. After the union of East and West Jersey and the establishment of New Jersey as a royal colony, he continued to take a prominent part in its affairs, serving for many years in both the Colonial Council and the Assembly. He served for a time as Chief Justice of both New Jersey and New York, was appointed Acting Governor of New Jersey in 1731, and from 1738 until his death was Governor of the colony.

MORRIS, LEWIS (1726-98). An American patriot during the Revolutionary War, and one of the signers of the Declaration of Independence. He was born at Morrisania, N. Y., graduated at Yale in 1746, and as early as 1767 became conspicuous as an opponent of the restrictive measures of the British Ministry. He was elected to the Continental Congress in 1775, and at the close of the session was sent to Pittsburg to secure, if possible, the adherence of the Indians. In 1776 he again sat in Congress, and was one of the signers of the Declaration of Independence. Giving up his seat in 1776 in favor of his half-brother, Gouverneur Morris he returned to his estate, and subsequently served as a member of the New York Legislature and as major-general of the State militia.

MORRIS, Sir LEWIS (1832—). An English poet, born at Carmarthen, Wales, in June, 1833. After graduating from Jesus College, Oxford (B.A. 1855, M.A. 1858), he studied law and was called to the bar at Lincoln's Inn (1861). He practiced as a conveyancer till 1880. He has taken an active part in higher education in Wales, serving on the governing boards of three Welsh colleges. On several occasions he has stood for Parliament in the Liberal interest, but without success. In 1895 he was knighted. His verse comprises *Songs of Two Worlds* (3 vols.,

1871-74-75); the *Epic of Hades* (3 books, 1876-77); *Gwen: A Drama in Monologue* (1879); the *Ode of Life* (1880); *Songs Unsung* (1883); *Gycia: A Drama* (1886); *Songs of Britain* (1887); *A Vision of Saints* (1890); *Songs Without Notes* (1894); *Idylls and Lyrics* (1896); and *Harvest-Tide* (1901). To the critic, Morris writes alight and easy verse on pretentious themes. But he has been exceedingly popular.

MORRIS, MARY (PHILIPSE) (1730-1825). One of the celebrated Philipse family, born in the Philipse manor house on the Hudson. She possessed much personal beauty, and, according to tradition, she received an offer of marriage from Washington, whom she met in 1756 while visiting her brother-in-law Beverly Robinson in New York. Two years later she married Captain Roger Morris, an English officer, and lived for many years in an elegant mansion—now known as the Jumel mansion—on the outskirts of New York. When the Revolution broke out, she remained loyal to the Crown, and as a result she was attainted of treason and her property was confiscated. Her mansion was subsequently used by General Washington as his headquarters. In 1809 her children sold their reversionary rights in the confiscated property to John Jacob Astor for \$100,000. In recognition of her loyalty, the English Government made her a grant of \$85,000.

MORRIS, MICHAEL, Baron Killanin (1827-1901). An Irish jurist. He was born in Galway; studied at Trinity College, Dublin; and was called to the bar. His great popularity made his advance in politics very rapid. He was elected to Parliament in 1865 as a Conservative; was named Solicitor-General of Ireland in 1866, a puisne judge in the following year, and after the abolition of his post of Chief Justice of Common Pleas, Lord Chief Justice. In 1900 he retired from the bench, and the same year was made an hereditary baron.

MORRIS, RICHARD (1833-94). An English philologist. He was born in London, was educated at Saint John's College, Battersea, in 1869 became lecturer on the English language and literature in King's College School, and in 1871 took holy orders. Four years later he was made headmaster of the Royal Masonic Institution for Boys. He edited a number of publications for the Early English Text Society, the Chaucer Society, and the Philological Society; and in 1874 was elected president of the latter. Besides his editions of early English works, he published: *The Etymology of Local Names* (1857); *Specimens of Early English* (1867); *Historical Outlines of English Accidence* (1872); *Elementary Lessons in Historical English Grammar* (1874); *Primer of English Grammar* (1876).

MORRIS, ROBERT (1734-1806). An eminent American financier and one of the signers of the Declaration of Independence. He was born at Liverpool, England, January 31, 1734. At the age of fourteen he was sent to America and placed in the counting house of Charles Willing, a rich Philadelphia merchant, whose partner he became in 1754, continuing as such until 1793. The firm of Willing & Morris became one of the leading mercantile establishments in America, and by the outbreak of the Revolutionary War Morris had already acquired a large fortune.

Although naturally averse to a rupture with Great Britain, he sacrificed his personal interests, signed the non-importation agreement of 1765, and served as a member of the citizens' committee that compelled the stamp distributor for Philadelphia practically to relinquish his office. In June, 1775, he became a member of the Pennsylvania Committee of Safety; in October of the same year he was elected to a seat in the Legislature of Pennsylvania (to which he was reelected in 1776), and in November he was appointed by that body a delegate to the Continental Congress. All three of these offices were held by him at the same time. As a member of Congress he served on several important committees and signed the Declaration of Independence, although he had opposed Lee's resolution of June 7th and absented himself from the Congressional hall on July 4th, when the final vote was taken. At the expiration of his term in Congress, in 1778, he was elected again to the State Legislature, but on account of miscellaneous charges against him in connection with his mercantile operations, he failed of reelection in the following year. In October, 1780, however, he was returned to the Legislature for the fourth time. It was at this time that the fortunes of the Colonial Army reached their lowest ebb. Charleston had fallen; Gates had been defeated by Cornwallis; Arnold's treachery cast gloom on the country. Munitions and supplies were sadly wanting, and Continental currency had depreciated until it was worth but little more than the paper on which it was printed. In this almost desperate situation, Congress resolved to supersede the old treasury board by a superintendent of finance. Morris was chosen to the position February 20, 1781, at a salary of \$6000 a year, and received large powers over the finances of the Confederation. His chief programme was to relieve the situation by import duties, loans and subsidies from France, and to inaugurate a policy of retrenchment. He was unable, however, to carry out the first part of his scheme on account of the refusal of the States to confer the necessary power upon Congress for the laying of import duties. On several occasions he succeeded in borrowing large sums on his personal credit, without which some of the important campaigns of the war would have been impossible. Thus the means which enabled Washington and Greene to carry out the campaign of 1781 were raised mainly by his exertions. In 1781, with the approval of Congress, he founded the Bank of North America, and became a large stockholder in it. This institution became of great service to the American cause and was, to a certain extent, under the control of Morris. He continued to hold the difficult and vexatious office of Superintendent of Finance until November, 1784, when he resigned it with a sense of relief. In the same year the Pennsylvania Legislature had annulled the charter of the bank, and in order to obtain its reestablishment Morris secured an election to the Legislature in 1785 and succeeded in having the charter renewed in 1786. In the latter year he was again elected to the Legislature, and in 1787 became a member of the Constitutional Convention at Philadelphia. He had the honor to nominate Washington for the Presidency of the Convention, but did not take a prominent part in the proceedings of that body. Upon the organ-

ization of the new Government, President Washington offered him the position of Secretary of the Treasury. He declined the offer and recommended Alexander Hamilton, who was appointed. At the same time, however, he accepted a seat in the United States Senate, where he served without special distinction until 1795. Unfortunate business speculations proved disastrous, and on February 16, 1796, he entered a debtor's prison in Philadelphia, where he was confined until August 26, 1801. He died May 8, 1806. A short biography of Robert Morris has been written by W. G. Sumner (New York, 1892). A more comprehensive work by the same author is *The Financier and the Finances of the American Revolution* (New York, 1891). Consult also Bolles, *The Financial Administration of Robert Morris* (1878).

MORRIS, THOMAS (1776-1844). An American anti-slavery leader, born in Augusta County, Va. His father removed to Ohio in 1795. While working on a farm in Clermont County, he studied law, and was admitted to the bar in 1804. From 1806 to 1830 he was a member of the Ohio State Legislature. In 1832 he was elected to the United States Senate, as a Democrat. He very soon took ground on the slavery question, however, in radical opposition to that held by the majority of his party. He willingly presented anti-slavery petitions, and ardently defended the right of petition in the Senate. He also spoke strongly against Texan annexation. In 1838, when Calhoun introduced a series of resolutions touching the constitutional status of slavery, Morris introduced a set of alternative resolutions embodying a rational and explicit statement of the views of the anti-slavery men. On the expiration of his term as Senator his constituents, to whom his views on the slavery question had been displeasing in the extreme, discarded him for Benjamin Tappan. In January, 1840, at the Democratic State convention, he was read out of the party, and later in the year associated himself politically with the new Liberty Party (q.v.) movement. In May, 1841, he was nominated for Vice-President on the Liberty Party ticket, on which James G. Birney had been named for President. These nominations, which were for the campaign of 1844, were confirmed at the Buffalo convention of the party in 1843. Consult: Smith, *The Liberty and Free-Soil Parties in the Northwest* (New York, 1897); and B. F. Morris, *Life of Thomas Morris* (Cincinnati, 1856).

MORRIS, WILLIAM (1834-96). An English poet, artist, and socialist, born at Walthamstow, near London, March 24, 1834. Morris's early boyhood was spent in the romantic region near Epping Forest, where he showed at the outset his love for nature. He was educated at Marlborough School and at Exeter College, Oxford. Here he mingled little in the college life, but he read swiftly and widely, thus quickly storing in his strong memory a stock of knowledge which he put to use. In 1854 distress of religion almost cast him upon the wave of Catholic feeling, but the impulse passed. He mastered Church history and Anglican theology, but he soon left them in a new enthusiasm for Carlyle, Ruskin, and Kingsley. In 1854 Morris visited France, whither he went again in 1855 with his friend Edward Burne-Jones (q.v.). On this tour he fell so

wholly under the spell of French Gothic that he gave up his earlier purpose of founding a religious brotherhood and became an architect. After trying his hand at architecture and painting, he found his true calling in 1861, when with Rossetti, Burne-Jones, and other friends, he established a firm in London for designing and manufacturing artistic furniture and household decorations. As time went on, Morris took up the manufacture of tapestry and other textiles, dyeing, book-illumination, and printing. The old firm of decorative art was dissolved in 1871; and in 1881 Morris transferred his works to Merton in Surrey. In 1890 he founded the famous Kelmscott Press at Hammer-smith. For the practical advancement of the lesser arts, and of the rare doctrine that all things should be made beautiful, Morris did more than any other man of his time. At Oxford, Morris showed his literary talent in several contributions in verse and prose to the *Oxford and Cambridge Magazine*, which he maintained (1856). Two years later he published the *Defence of Guenevere, and Other Poems*. This volume, pre-Chaucerian in tone, marks a date in later Romanticism; and never again did Morris equal it in force and concentration. Afterwards, Morris turned for his subjects to Greek, Old French, Norse, and other mediæval stories, which he clothed in verse with great facility. By the *Life and Death of Jason* (1867) and *The Earthly Paradise* (1868-70), he proved himself one of the best story-tellers since Chaucer, his avowed master. In the summer of 1871 he made a trip through Iceland. In 1876 appeared *Sigurd the Volsung and the Fall of the Niblungs*, a narrative poem approaching the dignity of an epic. Morris wrote many romances in prose or in prose and verse combined; among which are the *House of the Wolfings* (1888), *The Roots of the Mountains* (1890), *The Well at the World's End* (1896), and, best of all, the *Story of the Glittering Plain* (1891). In the same year he published a semi-utopian romance, *News from Nowhere*, in which he sought to popularize his socialistic ideals. As a translator, he succeeded capably in his renderings from the *Sagas*. In 1885 he became an active socialist, delivering lectures to workmen and contributing to the *Commonweal*, the organ of the Socialistic League. He died October 3, 1896, leaving to the world an immortal example of the man who devotes his wealth and his genius to the bettering of visible things and to the spread of manly ideals. A collection of various papers, entitled *Architecture, Industry, and Wealth*, was not published till 1903. Consult: Vallance, *William Morris, His Art, etc.* (containing a bibliography, London, 1897); Mackail, *The Life of William Morris* (London and New York, 1899); Cary, *William Morris. Poet, Craftsman, and Socialist* (New York, 1902); Riegel, "Die Quellen von William Morris's Dichtung, *The Earthly Paradise*," in *Erlanger Beiträge zur englischen Philologie* (Leipzig, 1890); and see PRÆ-RAPHAELITES.

MORRISBURG. A port of entry of Dundas County, Ontario, Canada, on the left bank of the Saint Lawrence River, opposite Waddington, N. Y., 43 miles southeast of Ottawa (Map: Ontario, H 3). It is on the Grand Trunk Railway at the entrance to the Rapide du Plat Canal. It has a shipping trade and is the seat of a United

States consul. Population, in 1891, 1859; in 1901, 1893.

MORRIS DANCE (from OF. *morisque*, *morésque*, Fr. *moresque*, from Sp. *morisco*, Moorish, from *moro*, Moor, from ML. *Morus*, Lat. *Maurus*, Gk. *Μαῦρος*, *Mauros*, Moor). An obsolete English dance of Moorish origin. It seems to have been introduced into England about the time of Edward III., but it did not become universally popular until the time of Henry VII. During the succeeding reign it reached its highest development. When danced in connection with May Day it was an elaborate costume dance, and the characters of Robin Hood, Friar Tuck, Maid Marian, Little John, a dragon, and hobby-horse were introduced. The costumes of the performers were generally decorated with scores of small bells which were tuned in musical intervals. There were several variations of the Morris Dance, the two most notable being a sword dance, where the performers leaped over swords, and a ribbon dance, in which the girls danced back and forth between colored streamers. At the Restoration the Morris Dance was revived for a time, but soon died out. There is at present in Yorkshire a country dance called the Morris, but the time (4) is the only feature which it has in common with its prototype.

MORRIS ISLAND. An island at the southern entrance to the harbor of Charleston, S. C. Three small batteries on Cumming's Point, at the northern end, took part in the bombardment of Fort Sumter on April 12-13, 1861. Later the works were strengthened and called Battery Gregg, and Battery Wagner was constructed to the south. In the spring of 1863 Admiral Du Pont and General Hunter made unsuccessful attempts to reduce these defenses. When these officers were succeeded by Admiral Dahlgren and General Gillmore, early in July, a landing was effected on the southern part of the island, but on the 11th and 18th desperate assaults failed. A regular siege was established and five parallels were constructed. The guns of Fort Sumter, which were trained to protect the island, were silenced by the Federal fleet, and on September 7th General Beauregard ordered the evacuation of the island. Later Battery Gregg was remounted by the Federal forces and did much damage to the city.

MORRISON. A city and the county-seat of Whiteside County, Ill., 124 miles west of Chicago; on the Chicago and Northwestern Railroad (Map: Illinois, B 2). It is surrounded by a section interested largely in farming, stock-raising, and dairying, and manufactures refrigerators and school furniture, flour, carriages, and wagons. It has a public museum and library. Population, in 1890, 2088; in 1900, 2308.

MORRISON, ARTHUR (1863—). An English novelist, widely known for the remorseless realism with which he depicts London life. His publications comprise: *Tales of Mean Streets* (1894); *Martin Hewitt, Investigator* (1894); *Chronicles of Martin Hewitt* (1895); *Adventures of Martin Hewitt* (1896); *A Child of the Jago* (1896); *The Dorrington Deed-Box* (1897); *To London Town* (1899); *Cunning Murrell* (1900), the scene of which is laid in Essex; and *The Hole in the Wall*, a story of Wapping (1902).

MORRISON, JAMES DOW (1844—). An American Episcopal bishop, born of Scottish parents in Waddington, N. Y. He received his early education in Canada, graduated from McGill University, Montreal, in 1865, and three years afterwards was ordained a deacon in Quebec. Becoming a priest in 1870, he took a charge in Canada, but the following year was called to Herkimer, N. Y., and thence to Ogdensburg in 1875, where he was archdeacon from 1881 until 1897, when he was consecrated first Protestant Episcopal Missionary Bishop of Duluth. In 1898 he was appointed Paddock lecturer by the General Theological Seminary of New York.

MORRISON, ROBERT (1782-1834). The first Protestant missionary to China, born at Buller's Green, Morpeth, England. Three years later his father removed to Newcastle. He learned the trade of boot-tree maker after leaving school. In 1797 he was converted, joined the Presbyterian Church, and began to improve himself by study. In 1803 he was admitted to Hoxton Independent Academy, and in the following year entered the Mission College of Gosport. The London Missionary Society decided in 1807 to begin mission work in China, and Morrison, having been ordained, was sent out as the first missionary. Under the protection of some merchants from the United States settled at Canton, he assumed Chinese dress and began the study of Chinese. In 1809 he was appointed translator to the East India Company's factory here, and while in this position he prepared a *Grammar of the Chinese Language*, published in 1815. Between 1815 and 1823 appeared the six thick quarto volumes of his *Dictionary of the Chinese Language*, a work of great learning, but now superseded. He also produced several vocabularies of Canton-English and English-Canton. His *New Testament* in Chinese was published in 1815, and the *Old Testament* appeared in 1818. In that year he founded the Anglo-Chinese College at Malacca. It was removed to Hong Kong in 1845. He died in Canton. Consult: the *Memoir* by his widow (2 vols., London, 1839); and Townsend, *Robert Morrison* (New York and Chicago, 1888).

MORRISON, WILLIAM (c.1783-1866). A Canadian explorer and fur trader, born at Montreal. He began trapping and trading for Sir Alexander MacKenzie & Co. at Fond du Lac in 1802, and joined the Northwest Company in 1805. After John Jacob Astor gained control in 1818 of the business in the United States, Morrison worked for him until 1826. Morrison claimed to have explored during the winter of 1803-04 Lac La Biche, or Elk Lake, which was long afterwards (1832) identified as the source of the Mississippi by Schoolcraft and renamed Itasca. He was probably naturalized as an American citizen, but spent the last years of his life in Canada. Consult *Minnesota Historical Society Collections* (vol. i., Saint Paul, 1872; vol. vii., Minneapolis, 1893; vol. viii., Saint Paul, 1898).

MORRISON, WILLIAM RALLS (1825—). An American politician and Congressman, born in Monroe County, Ill. He was educated at McKendree College, but left before graduation to enlist as a private in an Illinois volunteer regiment for the Mexican War, and participated in most of the battles of Taylor's campaign. After his return he studied law, was admitted to the bar,

and from 1855 to 1859 was a Democratic member of the Lower House of the Illinois Legislature, serving as Speaker in the last year. At the outbreak of the Civil War he organized and became colonel of the Forty-ninth Illinois Infantry, serving in that capacity until December, 1863, when he resigned to take his seat as a Democrat in the Thirty-eighth Congress, to which he had been elected while at the front in the preceding year. He practiced law from 1865 until 1873, and from that year until 1887 was again a member of the National House of Representatives. During his Congressional career he attained wide distinction as an advocate of a radical reduction in the tariff, but was never able to secure the support of enough members of his own party to assure the passage of bills which as chairman of the Ways and Means Committee he introduced in 1876, 1884, and 1886. The bill of 1884, embodying the famous 'horizontal' tariff scheme, which proposed a straight (or horizontal) reduction of 20 per cent. from the tariff of 1883, was defeated by a slender majority obtained through the opposition of the protectionist Democrats under the lead of Samuel J. Randall. In 1885 Morrison was defeated for election to the United States Senate by John A. Logan by one vote, and in the following year failed of reelection to the House. He was appointed by President Cleveland a member of the Interstate Commerce Commission in 1887, and served until 1897, for the last six years as chairman.

MORRISTOWN. A town and the county-seat of Morris County, N. J., 18 miles west of Newark; on the Lackawanna, the Rockaway Valley, and the Whippany River railroads (Map: New Jersey, C 2). Among the features of the town are Memorial and All Souls' hospitals, the Young Men's Christian Association and Young Men's Catholic Association buildings, a public park with a Soldiers' Monument, and a large public library and lyceum, occupying a handsome edifice. Here is the site of Fort Nonsense, erected by Washington and marked by a memorial monument. Four miles from the town, at Morris Plains, is the State Hospital for the Insane, which cost nearly \$3,000,000, has accommodations for 1500 patients, and at the time of its completion was the largest institution of its character in the United States. Morristown is in the rose and peach belt of the country, on a tableland surrounded by hills, rising nearly 700 feet above sea level, and is in a great measure a wealthy residential place with large villas. No effort has been made to foster manufacturing, but the trade of the town with the surrounding country is active. Its comparatively dry and bracing winter climate attracts invalids. The government, as provided under the original charter of incorporation, is vested in a mayor and a municipal council, of which the executive is a member. The school commissioners are chosen by popular vote. Population, in 1890, 8150; in 1900, 11,267.

Settled about 1710, Morristown was known as West Hanover until in 1740 it received its present name in honor of Lewis Morris, then Governor of New Jersey. During the Revolution Washington made his headquarters here from January to May, 1777, and again from December, 1779, to June, 1780, occupying during the latter period the old Ford mansion, which now belongs to the Washington Association, and in

which numerous Revolutionary relics are exhibited. At the old Speedwell Iron Works here the shaft of the *Savannah*, the first steamboat to cross the Atlantic, was cast, and here, from 1837 to 1843, Professor Morse and Alfred Vail perfected the electric telegraph. Morristown was incorporated in 1865. Consult: Colles, *Authors and Writers Associated with Morristown*, etc. (Morristown, 1893); Tuttle, *History of Morristown*.

MORRISTOWN. A city and the county-seat of Hamblen County, Tenn., 42 miles northeast of Knoxville; on the Morristown and Cumberland Gap and the Southern railroads (Map: Tennessee, H 4). It is the seat of the Morristown Normal College, a Methodist Episcopal institution for negroes. Morristown is the commercial centre of a rich agricultural section, and is an important stock market. The manufactures include flour, tobacco, stoves, wagons, leather, brooms, agricultural implements, and sash and blinds, and there are quarries of variegated marble and zinc, lead, and iron mines in the vicinity. Population, in 1890, 1999; in 1900, 2973.

MORS. The largest island in the Limfjord, in the northwestern part of Jutland, Denmark (Map: Denmark, B 2). Its area is 139 square miles. It is in marked contrast with the surrounding mainland, being much more fertile, and having a somewhat elevated (250 feet) interior, with steep coasts. Population, in 1901, 22,237. The chief town is Nykjöbing.

MORSE (probably from Icel. *mar*, sea + *ros*, horse, cf. Norweg. *rosmar*, walrus; less plausibly from Russ. *moryū*, *morzhū*, morse, from *morse*, sea). An old name for the Atlantic walrus (q.v.).

MORSE, EDWARD SYLVESTER (1838—). An American naturalist and archaeologist, born at Portland, Maine. He was educated at Bethel Academy, Maine, and at the Lawrence Scientific School, Cambridge. He was professor of comparative anatomy and zoölogy at Bowdoin College from 1871 to 1874, and at the Imperial University, Tokio, Japan, from 1877 to 1880. In 1881 he was appointed director of the Peabody Academy of Sciences, of which he was a founder. He also became known as a popular lecturer on natural history and Oriental travel. Morse established a reputation early as a zoölogist by the following studies of brachiopods, which proved them not to be mollusks: *Early Stages of Terebratulina* (1870); *Embryology of Terebratulina* (1872); *Systematic Position of Brachiopods* (1873). He also wrote *Ascending Process of the Astragalus in Birds* (1880). While in Japan Morse interested himself greatly in the art, antiquities, social customs, and folk-lore of the people, and he made extensive collections of pottery and investigated its prehistoric archaeology. Some of the results were published in the books: *Japanese Homes and Their Surroundings* (1886); *On the Older Forms of Terra-Cotta Roofing Tiles* (1892); and other pamphlets and papers, which are regarded as highly important by specialists. His unique collection of Japanese pottery and objects of art was bought by the Museum of Fine Arts in Boston, where it is installed separately as the 'Morse Collection,' of which Professor Morse was made curator. An illustrated *Catalogue* of it, prepared by Morse, was published by the

museum in 1901; it is regarded by critics as "a masterpiece of hard work and intelligence," and a fine example of beautiful book-making. Morse has also had charge for many years of the Museum of the Peabody Academy of Sciences at Salem, Mass.

MORSE, JOHN TORREY (1840—). An American biographer. He graduated at Harvard College in 1860, lectured there on history (1876-79), was co-editor with Henry Cabot Lodge of the *International Review*, and practiced law in Boston. His work is to be found in various reviews. His books include: a *Treatise on the Law Relating to Banks and Banking* (1870); *Law of Arbitration and Award* (1872); *Famous Trials* (1874); a *Life of Alexander Hamilton* (1876); *Life and Letters of Oliver Wendell Holmes* (1896), and in "The American Statesmen Series," edited by him, the lives of *John Quincy Adams* (1883), *Thomas Jefferson* (1883), *John Adams* (1884), *Benjamin Franklin* (1889), and *Abraham Lincoln* (1893).

MORSE, SAMUEL FINLEY BREESE (1791-1872). An American artist and inventor. He was born at Charlestown, Mass., and graduated at Yale College in 1810, later visiting England with the American painter Washington Allston, where he studied painting with him and Benjamin West. In 1813 he received the gold medal of the Adelphi Society of Arts for his first effort in sculpture, the "Dying Hercules." Returning to New York in 1815, he became in 1826 the first president of the National Academy of Design, and was appointed in 1835 professor of the arts of design in the University of the City of New York. He did not give his entire attention to art, but was interested in chemistry and especially in electrical and galvanic experiments; his interest doubtless being awakened in the subject of electro-magnetism through conversation with Prof. J. Freeman Dana, who lectured in New York on that subject in 1826-27, and exhibited an electro-magnet. Morse first conceived the idea of the telegraph while on board the packet-ship *Sully* on his way from Europe to America in 1832, while discussing the then recent discovery in France of a method for obtaining the electric spark from the magnet. Before the close of that year a portion of the apparatus which he had devised had been constructed in New York, but it was not until three years later that, in a room in the New York University building, he showed the telegraph operating with half a mile of wire. In September, 1837, he made a public exhibition of his discovery, and in that year filed his caveat at Washington. No result followed his appeal to Congress for aid during that session, and Professor Morse visited Europe with the hope of enlisting the interests of foreign governments in his invention. In this attempt he was unsuccessful, and he returned to New York, where, as well as in Washington, he struggled under serious privations during the four years which elapsed before he obtained (1843) Congressional aid. In that year, after he had almost yielded to despair, Congress at midnight, in the last moments of the session, appropriated \$30,000 for an experimental line between Washington and Baltimore. After this aid had been granted, Morse succeeded after many difficulties in establishing a working tele-

graph line, and the first message, "What hath God wrought?" was sent from the rooms of the United States Supreme Court in the Capitol at Washington to Baltimore on May 24, 1844. From this time the telegraph was an assured success, but Professor Morse was frequently involved in litigation to maintain his rights under his patents. He also was engaged in numerous controversies. But the number and character of the honors heaped upon Professor Morse on account of his invaluable invention have probably never been equaled in the case of any other American. See TELEGRAPH.

Professor Morse set up the first daguerreotype apparatus, and with Prof. John W. Draper was associated in taking the first daguerreotypes in America; he also laid the first submarine telegraph line (in New York Harbor in 1842); and from him, in a letter to the Secretary of the Treasury of the United States in 1843, seems to have come the first suggestion of an Atlantic telegraph. His death occurred about three months after his last public act—the unveiling of the statue of Benjamin Franklin, in Printing-house Square, New York. He died in New York, April 2, 1872. Consult Prime, *Life of S. F. B. Morse* (New York, 1875).

MORSE, SIDNEY EDWARDS (1794-1871). An American journalist, geographer, and inventor, a brother of Samuel F. B. Morse. He was born in Charlestown, Mass., graduated at Yale in 1811, studied theology and law, and in 1815 established the *Boston Recorder*, a weekly religious newspaper, which he edited for more than a year. In 1820 he published a small geography, and in 1823 a larger one called *A New System of Modern Geography*, of which more than five hundred thousand copies were ultimately sold. The success of the book was partly due to the later use in it of superior map-prints in color produced by a new process called cerography, which he, with the assistance of Henry A. Munson, developed in 1839. In 1823, with his brother Richard, he established the *New York Observer*, another religious weekly, and he continued to be its chief editor and proprietor until 1858.

MORSELLI, mōr-sēl'le, ENRICO AGOSTINO (1852—). An Italian alienist and neurologist, born at Modena, and graduated at the university of that city in 1874. He studied psychiatry at Reggio under Livi, and anthropology at Florence under Mantegazza, and subsequently became professor of psychiatry in the Turin medical school and physician in charge of the insane asylum in the same city. He is the author of a number of medico-legal and neurological papers. Among his published works are: *Critica e riforma del metodo in antropologia* (Rome, 1880); *Suicide: An Essay on Comparative Moral Statistics* (New York, 1882); *Manuale delle malattie mentali* (Milan, 1885); *Il magnetismo animale* (Turin, 1886). Morselli was co-editor of the *Rivista sperimentale di freniatria e di medicina legale* in 1875; and of the *Archivo di psichiatria* in 1885.

MORSHANSK, mōr-shānsk'. An important commercial town in the Government of Tambov, Russia, situated near the river Tana, about 60 miles north-northeast of the city of Tambov (Map: Russia, F 4). It produces tallow, soap, and spirits on a large scale, and is the seat of an

extensive trade in agricultural products and live stock. Population, in 1897, 27,756.

MORTALITY. STATISTICS OF. See VITAL STATISTICS.

MORTAL SIN. In Roman Catholic theology, the name given to the graver class of sins, in distinction from venial sins (q.v.). For a sin to be mortal, it must be a conscious violation of a known divine law, decided upon deliberately by a free will, and it must be in a matter of importance; thus, for example, the theft of a few pennies, without aggravating circumstances, would not be a mortal sin. Mortal sin, as its name implies, is believed to destroy absolutely the divine life of grace in the soul and render it deserving of eternal punishment, unless remitted by perfect contrition, or by attrition in conjunction with the sacrament of penance (q.v.).

MORTAR (OF, Fr. *mortier*, from Lat. *mortarium*, mortar; connected with *marcus*, hammer, Skt. *mar*, to crush). A mixture or paste of cement or lime and sand. Mortars may be classified according to the nature of the cementing substance used, into: Common lime mortar, hydraulic lime mortar, and cement mortar.

COMMON LIME MORTAR. Mortar made of common lime is extensively used because of its intrinsic cheapness and the ease with which it can be prepared. It sets or becomes hard only in air, however, and should consequently not be used under water or in wet places. Its small strength compared with cement mortar, however, limits its use to structures in which great strength is not required. In making lime mortar the proportions of the mixture are usually about one volume of lime to from two and one-half to three volumes of sand. The lime is placed in a layer in a shallow box or in a depression scooped out of the sand and then sprinkled with a quantity of water from two and one-half to three times the volume of the lime. This being done, the lime should be left to 'slack' undisturbed. It is generally held by engineers that the lime should be slacked at least twenty-four hours before it is mixed with the sand. This is frequently not done, through haste or carelessness, in common building operations. It is also important that all the water required for slacking should be added to the lime at one time, since the addition of water after slacking has begun retards that process and results in the production of a lumpy mortar. After the lime has been slacked the sand is spread in a layer over its top and the two materials are mixed and remixed by means of a hoe or shovel until a uniform paste is secured. The mortar is then ready for use.

HYDRAULIC LIME MORTAR. In hydraulic lime mortars the proportions of the ingredients and the manner of mixing them are substantially the same as for common lime mortar. The only change practically is the use of hydraulic lime instead of common lime. See CEMENT.

CEMENT MORTAR. The most valuable of all mortars are those made with hydraulic cements (see CEMENT) as a binding material. The proportions of the ingredients that are most commonly use are one part cement and two or three parts sand. To make the mixture about half the sand is spread in a layer over the bottom of the mixing box; the cement is then spread in a layer over this sand bed, and is in turn covered with the remainder of the sand. The mass of

cement and sand is then turned and re-turned with a shovel until the two ingredients are thoroughly intermingled. Water is then added to the mixture, which is again turned by the shovel until it is uniformly wet.

GROUT. A thin or liquid mixture of lime or cement is called grout. It is used to fill up small interstices by pouring it upon the masonry, into the voids of which it is expected to find its way because of its liquid nature.

For a comprehensive discussion of mortars, see Baker, *A Treatise on Masonry Construction* (New York, 1902). See BUILDING.

MORTAR. A type or form of ordnance used for high-angle fire. In design it is short in length in proportion to its calibre or size of bore. In the United States and England mortars are almost entirely used for coast defense purposes. In the former country mortar batteries consist of either eight or sixteen mortars each, four mortars to a pit. The pits are fortified with parapets constructed of sand reinforced on the interior by a concrete wall. They are separated by substantial traverses which contain the necessary magazines, bomb-proofs, etc. (See illustration under FORTIFICATION.) The batteries are controlled by an officer (the predicting officer), who observes the plotting board, the target, and the effect or destination of the projectile, in order to give the proper direction and elevation to the men working the pieces in the pit. France has taken the lead in the manufacture of these types of ordnance, the Creusot works of Messrs. Schneider & Co. being perhaps the best known in the world.

The use of field mortars has not been as yet put to the test of modern battle conditions, so that their employment is largely a matter of conjecture. In 1903 Russia led the world with a regularly organized and equipped division of 24 batteries, 6 mortars to a battery. Austria and Germany come next, the latter country differing from Russia in details of organization. Although the advantages of field mortars are conceded to be greater than their disadvantages, the latter are still sufficiently important to delay their general immediate employment. The most important disadvantage is the difficulty of getting men so thoroughly trained that they are equally expert with the ordinary flat projectory field gun and the high-angle mortars. Another defect in field mortars is their utter inability of defending themselves at close range. For illustration of the 12-inch breech-loading mortar used in the United States service, see COAST ARTILLERY, and for an illustration of the 10-inch cast-iron muzzle-loading mortar, see ARTILLERY. See also COAST DEFENSE; HOWITZER; ORDNANCE. Under the latter head the construction of a modern mortar is described.

MORTARA, mór-tá'rá. A town in the Province of Pavia, Italy, situated on the Arbogna, and at the junction of several railroads, 25 miles southwest of Milan (Map: Italy, C 2). There are a Gothic church (San Lorenzo), with paintings, a theatre, and a high school. Manufactures of machines and hats are carried on. At the battle of Mortara, March 21, 1849, the Austrians defeated the Sardinians. Population (commune), in 1881, 8085; in 1901, 8631.

MORTARA, EDGAR. A Jewish boy whose alleged abduction excited much interest in Europe in 1858 and following years. He was the son of

Momolo Mortara, a resident of Bologna, and, as was said, was forcibly taken from his father's house on June 23, 1858, by the authorities on the ground that he had been baptized into Christianity by a Roman Catholic maid-servant. The efforts of the parents to recover the boy aroused much sympathy, but were unsuccessful. Apparently of his own choice, he remained with the Church authorities, was educated for the priesthood, became an Augustinian monk, and preached his first sermon in 1874. Consult *The True Story of the Jewish Boy Edgar Mortara* (London, 1860).

MORTAR VESSEL. A vessel fitted for carrying and operating a mortar. Such a vessel requires good beam and a strong deck to resist the recoil of the mortar. During the Civil War schooners were used as mortar vessels. In Europe, ketch-built vessels were largely used for this purpose, the so-called bomb-ketch being a frequent adjunct to a fleet in conducting operations against land defenses. Ketch-built vessels are not only stoutly framed and broad of beam, but the length of deck forward of the masts gives ample room for working a mortar.

MORTE D'ARTHUR, *mört därt'ur'* (OF., the death of Arthur). The name applied, in slightly varying forms, to several versions of the Arthurian legend and cognate stories. (See **ARTHUR**.) There are two English metrical romances of the name, each existing in a single manuscript, and probably based on French originals. But in more than one way the most important work bearing this name is the celebrated reduction or blending by Sir Thomas Malory of French and English romances. It was completed in 1469 and first printed, by Caxton, in 1485. Of this edition but two copies exist, the only perfect one in New York: a scholarly reprint of it, with valuable editorial matter, was made by Sommer (London, 1889). Probably very popular for a time, this 'noble and joyous book,' as Caxton calls it, fell later into disrepute with an age out of harmony with its spirit, and was scornfully condemned by Ascham in a well-known passage of *The Schoolmaster*. But the nineteenth century recognized fully its extraordinary merits. "There was," says Saintsbury, "at Ascham's date, no more exquisite example of English prose in existence. There is not to this day a book, either in prose or in verse, which has more of the true romantic charm." Apart from the skillful combination of diverse elements to make a story, in which Malory shows little short of genius, his style, in its stately harmony and graceful picturesqueness, is most remarkable for its period. Indeed, he may be called the first English writer who shows a sense of the rhythmical flow and gracious music of which the language is so richly capable. The book probably did more than any other influence to nationalize the Arthurian legend; and the poets, from Spenser to Tennyson (in the *Idylls of the King*), have drawn abundantly on its treasures. The best modern editions, besides that mentioned above, are by Rhys (London, 1894); Wright (ib., 1856); Strachey (ib., 1868); and Gollancz, "Temple Classics" (ib., 1900).

MORTGAGE (OF. *mortgage*, *morgage*, Fr. *mortgage*, from *mort*, from Lat. *mortuus*, dead, from *mori*, Skt. *mar*, to die + *gage*, ML. *vadium*, *vadium*, from Goth. *vadi*, OHG. *wetti*, Ger. *Wette*, AS. *wedd*, archaic Eng. *wed*, Lat. *vas*, pledge, Lith. *vaduti*, to redeem a pledge). Mort-

gage is the conveyance or transfer of property, either real or personal as security for the payment of a debt or the performance of a legal obligation.

The debtor or obligor may, and usually does, retain possession of the property mortgaged—the validity of the security not depending upon possession as in the case of pledge (q.v.) and common-law lien (q.v.) This method of securing performance of an obligation was known to the ancient law; and under the civil law the distinction was well settled between *hypotheca*, in which the property given as security remained in the possession of the debtor, and *pignus*, in which the property given as security was surrendered to the creditor.

Some writers have attributed the origin of the common-law mortgage to the civil law, while others assert that it grew out of the common-law conditional gift. However this may be, the giving of security by mortgage first became of importance at common law after the passage of the statute *Quia Emptores* (18 Edward I.), by which the restraints on alienation of lands held in fee were removed. Mortgages were then in form conditional grants, a form of gift or limitation peculiarly adapted to the giving of security without necessarily changing the possession of the security. At common law the owner of real estate might grant to another any estate in fee with the right on the part of the grantor or his heirs to reënter upon the property and revest the title in the grantee or his heirs upon the happening of a specified condition.

By making the condition of reëntry the payment of money or the performance of an obligation due from the grantor to the grantee, all the essentials of a common-law mortgage were created. Upon payment of the sum due when due, the condition of the grant or conveyance happened and title was thereby revested in the grantor or mortgagor, but if the mortgagor failed to pay the mortgaged debt when due, performance of the condition thereafter became impossible, and the mortgagor thereby lost all claim upon the mortgaged property.

Equity early exercised its jurisdiction to mitigate the harsh operation of the common-law rule relating to conditional conveyances by allowing the mortgagor who had failed to perform his obligation upon the due date (or the law day, as it was called) to redeem the mortgaged property upon payment of the sum due with interest. But as a means of limiting this equitable right of the mortgagor, equity also gave to the mortgagee the right to cut off the right of redemption by foreclosure, which was an equitable suit asking a judicial declaration that the right to redeem had been forfeited.

The modern law of mortgages, then, combines both legal and equitable doctrines; and many of its peculiarities, both of form and substance, will be explained by reference to the historical development of the law. While the mortgage in modern practice may, for most purposes, be regarded only as a lien created in favor of the mortgagee, it is still in form a conveyance vesting the title of the property in the mortgagee, and in the absence of statute, it is generally the rule that no mortgage valid at law can be created without a conveyance.

It is usual to incorporate in the mortgage a clause providing for the defeasance of the title upon payment of the mortgage indebtedness, but,

as will appear, even that is not essential. In some States statutes have been passed authorizing a mortgage which is not a conveyance in form, but which for all practical purposes has the same effect as the common-law mortgage as modified by equity. One important consequence arising from the fact that at common law the mortgagee acquired a title was that his mortgage was valid against an innocent purchaser of the property for value without notice of the mortgage, which could not have been the result had the mortgage been a mere lien or right *in personam* against the mortgagor. See EQUITY; FRAUD.

This rule has been modified in the United States by statutes universally adopted requiring mortgagees and purchasers of property generally to record their documents of title in order to protect them against claims of purchasers without notice.

When the intention of an agreement is to create a mortgage, although it is not in effect a conveyance and consequently not a legal mortgage, equity will enforce the agreement against the mortgagor or third parties having notice of the agreement as though it were a valid mortgage.

Thus where the owner of real estate deposited his title deeds of the property with another for the purpose of securing a debt or obligation, the English courts of equity have recognized in the transaction a valid mortgage. This doctrine of creating a mortgage by pledge of title deeds has not been recognized in the United States. (See LIEN.) When a conveyance is absolute on its face, equity, disregarding the parol-evidence rule, will inquire into all the circumstances of the transfer of title, and if it appear that the transfer was made only for the purpose of giving security, equity will treat the whole transaction as a mortgage and allow the grantor to redeem the property upon payment of the mortgage indebtedness. All mortgages, however, whether express or implied from the circumstances, are to be distinguished from conditional sales, which are agreements to sell and transfer title to the property upon the happening of a certain event. It will be observed that the position of a mortgagor is closely analogous to a conditional vendor who has agreed to sell property upon payment of a certain sum. There is, however, one important distinction between the two relations. In the case of conditional sales there is no existing indebtedness. The vendee is under no obligation to pay money to the vendor before electing to purchase, while the mortgagor is so bound. In determining in any given case whether the transaction is a conditional sale or a mortgage, courts will scrutinize the evidence with great care, and in case of doubt the tendency is to hold the transaction to be a mortgage. From the nature of mortgage it seems probable that a legal liability independent of the mortgage itself is not essential to its validity, but in general all mortgages are accompanied by some form of legal obligation for the performance of which the mortgage is given as security. This is usually a promissory note or bond payable to the mortgagee, and where the purpose is to issue numerous bonds secured by one mortgage, the practice is to make the mortgage or conveyance to a trustee, who holds the property as security for all the bondholders. Railroad mortgages are usually made in this manner. If the note or bond is illegal or there is any illegality in the mortgage transaction, the mortgage is invalid.

Mortgages are sometimes given to secure future advances to be made by the mortgagee. Such mortgages are valid and enforceable as between the mortgagor and mortgagee, but in some States they are held not to be valid against third parties, except as to advances actually made, of which the third party has actual or constructive notice at the time of acquiring an interest in the property. In a number of States, statutes provide that mortgages for future advances shall have no validity against third persons.

Any legal property, either real or personal, may be mortgaged, even including future or inchoate property, as crops planted but not yet grown, which the common law regards as being capable of present ownership. But a mortgage of property not yet acquired by the mortgagor could have no validity at common law. Mortgages of this character as well as mortgages of equitable interests were recognized and enforced by equity when the rights of innocent third parties were not involved. Such mortgages are now generally regarded as valid between mortgagor and mortgagee, but there are a variety of views held in the several States as to their validity against third parties—some courts, as those of Massachusetts, holding that they can have no validity against even creditors of the mortgagor unless the mortgaged property is delivered to the mortgagee, and some, as those of New Jersey, holding that they are valid against all parties having notice of the mortgage.

The mortgage, besides a description of the mortgaged property and the mortgage indebtedness, may, and usually does, contain clauses providing that the whole debt shall become due and payable upon failure to pay interest or taxes and assessments upon the mortgaged property. The mortgage may also include a power of sale enabling the mortgagee to sell the mortgaged property without foreclosure upon the mortgagor's failure to pay the debt. In many States such a provision is made inoperative by statutes which require foreclosure of the mortgage exclusively by judicial proceedings. A stipulation that the mortgagor shall have no right to redeem will be disregarded by the courts upon the same principle that courts of equity disregarded the condition of the common-law mortgage.

The estate of the mortgagor in possession has been likened to a tenancy at will or by sufferance, and as between himself and the mortgagee, the analogy is very close. At common law the mortgagee having the title could take possession at will, the sole right of the mortgagor, if the mortgagee exercised this right, being to redeem by payment of the mortgage indebtedness on the due date, but as to all others, the mortgagee in possession is clothed with substantial ownership. He is entitled to the rents, issues, and profits of the mortgaged property; he may sell or incur the subject to the mortgage, and upon his death the property goes to his heirs at law.

In many States the mortgagee's common-law right to take possession of the mortgaged property by ejectment or other appropriate action has been cut off, and he can only secure possession of the mortgaged property through foreclosure.

Although the mortgagee holds the title to the mortgaged property, the law recognizes that he holds it as an incident to his claim against the debtor, which is personal property. The mortgagee's estate, therefore, in both real and per-

sonal property, is regarded as personal property only, and passes, upon his death, to his next of kin and not to his heirs.

In general, the mortgagee out of possession is in the position of one having a mere lien or personal claim against the mortgagor. But the mortgagee in possession of the mortgaged property, who was at common law substantially in the position of owner of the property, was compelled by equity to account for the rents, issues, and profits, and to apply them upon the mortgage indebtedness. This is now the established rule.

Both the mortgagor and the mortgagee may freely assign their interests. It is not unusual for the assignee of the mortgagor to assume the mortgage indebtedness by the instrument of assignment, and it is the general rule that the mortgagee may enforce this undertaking either upon the theory of subrogation or that the mortgagee may sue upon a contract made for his benefit. For other incidents of the estates of mortgagor and mortgagee, see CURTESY; DOWER; FIXTURES; WASTE.

When several mortgages are given upon the same property they have priority in the order of their creation unless otherwise provided. This rule may be varied by the operation of the various recording acts.

A mortgage may be extinguished by payment of the mortgage indebtedness, or by a legal tender of the amount due on the day when due. Tender after that time had no effect at common law, and in equity the only effect was to prevent interest accruing. A mortgage may also be terminated by a release of the mortgagor, or by a merger. If the merger is accomplished by a conveyance of the mortgaged property by the mortgagor to the mortgagee, the courts will scrutinize the transaction with the greatest care, and if there appear to have been any unfairness or undue influence on the part of the mortgagee, will allow the mortgagor to redeem. See MERGER.

A mortgage is extinguished by the final judgment or decree in an action to foreclose the mortgaged property or in an action to redeem it from the mortgagee. See FORECLOSURE; EQUITY OF REDEMPTION.

Courts have always favored the mortgagor's right to redeem, and at any time before the extinction of the mortgage will allow him to compel a cancellation and surrender of the mortgage upon payment of the mortgage indebtedness with interest, and, as an incident to the redemption, will compel the mortgagee to account for rents or other income which he has received from the mortgaged property. Consult: Jones, *Treatise on the Law of Mortgages of Real Property* (5th ed., Boston, 1894), and of *Personal Property* (4th ed., Boston, 1894); Pingrey, *Treatise on the Law of Chattel Mortgages* (Jersey City, 1891); *On the Law of Mortgages of Real Property* (Jersey City, 1893); and the authorities referred to under REAL PROPERTY.

MORTGAGE BANKS. Banks designed primarily to furnish credit on land, houses, mines, and other immovable property. The loans are usually for periods from ten to seventy-five years, and are secured by mortgage. The loan contract provides for the extinguishment of the debt by means of equal annual payments, comprising interest and amortization; but the debtor has the option of paying the principal in anticipation, and, as a matter of fact, a large percentage

of the loans made by mortgage banks are canceled before maturity. The bank secures funds by selling its obligations or mortgage pledges, the difference between the interest on the loans made by the bank and the interest which it pays on its obligations constituting its profit. Mortgage banks are found in many European countries. The first important one was the *Crédit Foncier* of France, which has been in existence since 1852 and has had an organization similar to that of the Bank of France since 1854. It can make loans on first mortgages to the amount of one-half of the estimated value of houses and farms, and one-third of that of vineyards and other plantations. The rate of interest on loans must not exceed the rate paid by the bank on its obligations by more than six-tenths of one per cent. The *Crédit Foncier* of Algeria and the *Crédit Foncier Colonial* were formerly branches of the *Crédit Foncier* of France, but are now independent. Instead of one large national organization, Germany has forty mortgage banks, fourteen of which are in Prussia. In 1898 these institutions had an aggregate capital of 554,297,256 marks and held mortgages to the amount of 6,207,889,143 marks. Some of them, however, issued other forms of credit. In Belgium the only bank which deals in mortgages exclusively is the *Crédit Foncier*, but there are banks at Brussels and Antwerp which deal largely in land credit. Similar institutions are found in Austria-Hungary, Holland, Italy, Spain, Portugal, Sweden, and Russia. The chief service of mortgage banks consists in making mortgages negotiable. In Europe, the owners of land and houses are able to get loans at a low rate of interest—less than 3 per cent. in France and 4 per cent. in Germany. They can pay their debts in small yearly installments from the produce of their capital. In the United States, where there is no legislative provision for the establishment of mortgage banks, the lender and the property owner can be brought together only by a form of brokerage, and the terms of the debt usually require the payment of the principal in a few years. Consult the article on "Hypothekenbanken," in Conrad, *Handwörterbuch der Staatswissenschaften* (Jena, 1898-1901); Taft, "Mortgage Banks," in *Journal of Political Economy* (September, 1898).

MORTIER, mór'tyá', EDOUARD ADOLPHE CASIMIR JOSEPH, Duke of Treviso (1768-1835). A French marshal. He was born at Cateau-Cambrésis. February 13, 1768. His father was a Deputy to the States-General in 1789, and though Mortier was educated for a business career, he entered the service of the Republic as a lieutenant of carbineers in 1791. He rose rapidly, and in 1793 became adjutant-general. After greatly distinguishing himself under Moreau and Kléber, he was made a general of division in 1799. In 1803 he was in command in Hanover, and in the administration of that country showed the utmost probity and sagacity. Created a marshal of the Empire in 1804, and placed in charge of an army corps in 1805, Mortier showed his military genius by holding in check a superior force of Russians at Leoben. In 1806 he occupied Hanover, Hesse-Cassel, and Hamburg, and defeated the Swedes in several encounters. He commanded the left wing of the French army at Friedland, and after the Peace of Tilsit was in-

trusted with the government of Silesia and created Duke of Treviso. Sent to Spain in 1808, he took part in the siege of Saragossa and defeated the Spaniards at Ocaña (November 19, 1809). After sharing in the Russian campaign of 1812 Mortier took a decisive part in the battle of Lützen (May 2, 1813) and in all the subsequent military events of 1813-14. When Napoleon's cause was lost, Mortier at last gave in his adhesion to the Government of Louis XVIII. During the period of the Hundred Days Mortier first saw the King safely out of France and then joined his old leader. After the second Bourbon restoration, he was crossed off the list of peers for refusing to sit on the court martial of Ney. He became a member of the Chamber of Deputies in 1816, and was restored to the Chamber of Peers in 1819. After the Revolution of 1830, he was made Ambassador at Saint Petersburg, became Grand Chancellor of the Legion of Honor in 1833, and Minister of War and president of the Council in 1834-35. He was killed on the Boulevard du Temple, July 28, 1835, by a missile from the infernal machine of Fieschi (q.v.).

MORTILLET, mōrt'è-yà', LOUIS LAURENT GABRIEL DE (1821-98). A French anthropologist, born at Meylan, Isère. His interest in prehistoric archaeology dates from a trip to Italy in 1858, and he began to study the Swiss lake dwellings. In 1864, after his return to France, he founded a review, *Matériaux pour l'histoire positive et philosophique de l'homme*, and in 1868 became an assistant at the Museum of Saint Germain. In 1876, with Broca, he planned the Ecole d'Anthropologie. His published work includes: *Signe de la croix avant le christianisme* (1866); *Les habitations lacustres du lac du Bourget* (1867); *Origine du bronze* (1876); *Le préhistorique* (1882); and *Origines de la chasse, de la pêche et de l'agriculture* (1890).

MORTIMER, JOHN HAMILTON (1741-79). An English painter and engraver, born at Eastbourne. He was a pupil of Hudson and of Reynolds, and won the first prize of the Society of Arts in 1763. His vigorous if somewhat uncertain talent and his love of the terrible are shown in such works as the "Battle of Agincourt," "Vortigern and Rowena," and "Hercules Slaying the Hydra," in the Victoria and Albert Museum, South Kensington. He was elected a Royal Academician in 1779. His etchings are notable for their bold execution. They include several after his own works. He also made designs for stained-glass windows in Salisbury Cathedral and Brasenose College, Oxford.

MORTIMER, ROGER DE (1287?-1330). First Earl of March and eighth Baron of Wigmore. For some years he was a faithful adherent of Edward II. of England, and from 1316 to 1321 his representative in Ireland to oppose Edward Bruce; but when recalled in 1321 Mortimer joined the insurgent barons who were hostile to the Despencers, with whom he had been allied for a year. In 1322 Mortimer submitted to Edward and was imprisoned in the Tower of London, but escaped to France two years later. There he met and fascinated Queen Isabella, wife of Edward, became her paramour, and determined upon the overthrow of the King. With a small force the two landed on the English coast in 1326, and were soon joined by large numbers of the discontented nobles and common people. The King was defeated, taken prisoner, and

probably murdered in his prison in 1327. Mortimer took the title of Earl of March in 1328, and received confiscated estates and offices of immense value, while his creatures controlled the administration. Edward III. was a minor, and, though a council held the regency, Mortimer's influence was supreme. Mortimer became very unpopular when he made the 'Shameful Peace' with the Scots in 1328. Finally Edward III. resolved to be King in fact as well as in name, had the Earl of March seized at Nottingham Castle, and summoned a new Parliament. Mortimer was tried on charges of treason, condemned, and in 1330 hanged, drawn, and quartered. (See Edward III.) Consult: Stubbs, *Constitutional History*, vol. ii. (4th ed., Oxford, 1896), and Longman, *Edward III.*, vol. i. (London, 1869).

MORTIMER, HIS FALL. A fragment of a tragedy by Ben Jonson, consisting of only the argument and a few lines. It was completed in 1691 by W. Mountfort as *King Edward III., with the Fall of Mortimer*. Coxeter states that it was written by John Bancroft, who presented it to Mountfort.

MORTIMER'S CROSS, BATTLE OF. See EDWARD IV.; ROSES, WARS OF THE.

MORTISE (OF. *mortaise*, *mortoise*, Fr. *mortaise*, Sp. *mortaja*, mortise; possibly from Ar. *murtazz*, fixed, p.p. of *artazza*, to be fixed, from *razza*, to lay) **AND TENON** (OF., Fr. *tenon*, from *tenir*, to hold, from Lat. *tenere*, to hold). A form of joint in carpentry. The tenon is a projection, generally rectangular in form, on the end of a piece of wood, cut so as to fit exactly into a deep groove (called the mortise) in another piece, so that the two are united at a required angle. The framing of doors, shutters, and such pieces of joinery is usually fitted together with mortise and tenon joints. Mortise holes are also made to receive locks and other fittings.

MORTMAIN (OF. *mortemain*, from ML. *mortua manus*, dead hand), **STATUTES OF.** The term mortmain is applied to the perpetual tenure of lands by corporations, particularly church corporations, whose members and officers, being ecclesiastics, were by the early law deemed civilly dead, and hence the derivation of the term as signifying land held by the dead hand of the Church. In later times the term has been applied to the tenure of lands by corporations generally, whether ecclesiastical or lay.

Mortmain first became a matter for the serious attention of English legislators and lawyers as early as the reign of Edward I. The policy of the various ecclesiastical corporations of acquiring large holdings of land and retaining them became a menace to the well being of the State, partly because it afforded a ready means of accumulating wealth and power which were held in strict allegiance to the Church, whose interests were often in conflict with those of the civil authority, but primarily because the ownership of land by ecclesiastical corporations was inconsistent with feudal tenure. The feudal system presupposed the holding of land by a tenant who could render to his overlord certain services or dues upon the happening of certain events. The most important of these were: (a) *Relief*.—A sum which an heir was accustomed to pay to the lord upon coming into his ancestor's tenancy. (b) *Wardship*.—The right

of the lord to become the guardian of the infant heir of his tenant. (c) *Marriage*.—The right of the lord to dispose of the tenant's daughter in marriage. (d) *Escheat*.—The right of the lord to the freehold upon the death of the tenant without heirs.

It is apparent that the acquisition of land by an ecclesiastical corporation which could not die or contract marriage, and which had not any of the other attributes of a natural person, struck at the very basis of the feudal system, and was regarded with jealousy by the great lords and civil officers of the Crown. The result was a series of legislative enactments, extending over a period of nearly six hundred years, having for their purpose the restraint of alienation in mortmain. No sooner did the will of the State find expression in appropriate legislation for this purpose than the powerful influence of the Church sought to evade or nullify it by judicial interpretation or by resort to legal fictions invented by skillful lawyers and urged by them upon the courts with such success that ultimately new legislation became necessary. To this historic struggle between the Church and the landed aristocracy are attributable many of the peculiarities of the common law of real property.

The earliest statute relating to the subject after the fall of the Western Empire was an edict of the Emperor Frederick Barbarossa in 1158 prohibiting conveyances to church corporations. In England there have been enacted in all twenty-one statutes affecting the power to alienate in mortmain. The earliest of these (a provision contained in the Magna Charta, ch. 43, that there should be no transfer of land to church corporations by a tenant without the consent of his lord) seems to have fallen into disuse or to have been evaded by conveyances direct to the officers of the religious houses, who held the property for the benefit of such houses.

The next statute of importance, and the first to curb effectively the acquisition of land by the ecclesiastical corporations, was the statute *De Religiosis* (7 Edw. I., Stat. II., ch. 13), passed in 1279. The preamble of this interesting piece of legislation reads as follows:

"Where of late it was provided that religious men should not enter into the fees of any without license and will of the chief lord of whom such fees be holden immediately, and notwithstanding such religious men have entered as well into their own fees as into the fees of other men, appropriating and buying them, and sometimes receiving them of the gift of others, whereby the services that are due of such fees and which at the beginning were provided for defense of the realm are wrongfully withdrawn, and the chief lords do lose their escheats of the same—" etc.

This statute made all alienations in mortmain unlawful, and made the provision effective by enacting that all such conveyances should work a forfeiture to the lord of the land attempted to be conveyed. The lawyers of the time, however, soon devised a method for evading the statute by the use of common recovery (q.v.). This development in the common law was met by a new legislative enactment (13 Edw. I., ch. 32), in 1285, which forbade alienation of lands in mortmain by common recovery, and attached

the same penalty to such alienation as in case of the conveyances forbidden by the Statute *De Religiosis*. The Statute *Quia Emptores* (18 Edw. I., ch. 1), which removed some of the common-law restraints upon alienation, expressly excluded from its operation all alienation in mortmain.

These statutes in time were evaded by the practice of conveying lands to a layman to be by him held for the use or benefit of an ecclesiastical corporation, which obligation came to be enforced by the Chancellor. The *use* was the forerunner of the modern trust and the basis of equity jurisdiction over trusts. And it is to the great struggle over alienation in mortmain more than to any one other factor that the growth of the modern law of trusts is due. In 1391 this practice was forbidden on pain of forfeiture, unless such conveyance to *uses* was licensed by the King (15 Richard II., ch. 5).

The Statute of Wills, allowing testators to dispose of their property by will, did not in terms permit the testator to devise real estate to a corporation. By judicial interpretation, however, the power was established to devise lands to corporations for charitable purposes.

From this period down almost to the present time statutes have been enacted modifying or further restraining the power of alienation to corporations, whenever judicial interpretation or the ingenious devices of lawyers made such enactments necessary.

The statute 9 Geo. II., ch. 36 (1736), is noteworthy in that it shows that the policy on which the Statute of Mortmain had hitherto been based had then changed somewhat. This statute, reciting that "public mischief had greatly increased by many large and improvident dispositions made by languishing and dying persons to charitable uses, to take place after their deaths, to the disinherison of their lawful heirs," enacted that in future no lands or sums of money to be laid out in land should be given to any person or body unless such gift or conveyance should be made or executed in presence of two witnesses twelve months before the death of the donor or grantor, and be enrolled in the Court of Chancery within six months after the execution. Under this act, therefore, a person on his deathbed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor at least twelve months before his death, and the property must be completely alienated so that he has no further control over it. The deed must have a present operation, and must not reserve any life interest to the donor; it must be done at once and forever. The policy of this statute has sometimes been questioned, and several well-known modes of evading the statute have been adopted from time to time.

All the English statutes of mortmain were revised and consolidated by the statute 51 and 52 Victoria, ch. 42. In general the statute still restricts alienation to corporations, but makes numerous exceptions in favor of gifts to churches, public parks, museums, and for literary and scientific purposes. Gifts to charity by will are regulated by 54 and 55 Victoria, ch. 73, which in general permits such gifts of land to charities if the land be sold within one year from the testator's death. Throughout the period of mortmain legislation it was possible for the Crown to grant a mortmain license enabling a cor-

poration to purchase and hold lands, a prerogative which at times was freely exercised.

Owing generally to the absence of great religious corporations in this country, and to the fact that the feudal system never obtained a foothold here, the mortmain acts were not reenacted in the United States, with possibly one or two exceptions. Pennsylvania has a mortmain act, and New York has a statute which, like the statute of 9 George II., seems calculated rather to restrain a testator from making unwise and improvident gifts to charity than to prevent land-holding by corporations. The statute provides that a testator who leaves surviving him a wife, child, or parent shall not devise or bequeath more than one-fourth of his estate to a charitable corporation; and no such devise or bequest shall be valid unless made more than two months before the death of the testator.

In many States business corporations may not receive real estate by devise, but generally charitable corporations may do so; and in most States there is no restraint upon conveyance of lands *inter vivos* to corporations, unless the charter of the corporation or the general law under which it is created limits the total amount of land which the corporation may hold. See CHARITABLE TRUSTS; USES; and TRUST; and consult the authorities there referred to, and also under REAL ESTATE. Also consult: Highmore, *View of the History of Mortmain* (London, 1809); Rawlinson, *Notes on the Mortmain Acts* (London, 1877).

MORTO DA FELTRE, mór'tò dà fèl'trà (c.1474-c.1519). An Italian painter, born at Feltre. His fame rests upon Vasari's statement that he was the first to use classic arabesques in ornamentation. Of his life nothing certain is known, nor do any authenticated works by him survive. Cambruzzo, a seventeenth-century historian of Feltre, identified him with Pietro Luzzi (also called Zarato) of that town, who was an assistant of Giorgione at Venice. Luzzi is recorded as having been at Rome in 1495, at Florence in 1506, and at Venice in 1508. He is known to have decorated with frescoes the town-hall, the Church of San Stefano, and two houses in his native town. According to the usual account, Morto was killed fighting in the Venetian army at the battle of Zara; but if he be identical with Luzzi, he cannot have died till after 1519, in which year the latter was active in his native town.

MORTON, CHARLES (1627-98). An English clergyman and educator, born at Pendavy, Cornwall, and educated at Wadham College, Oxford. He renounced the Royalist traditions of his family and became a Puritan, though he did not leave the Anglican communion until 1662. He opened a school for dissenters at Stoke Newington, near London, which he maintained until 1685, having Daniel Defoe among his pupils. Contrary to the custom of the universities, he made his pupils write their dissertations and hold their disputations in English—a practice which, Defoe affirms, made his pupils excel in English those of any other school. In 1686 he emigrated to New England. He settled first at Charlestown, Mass., and became the pastor of a church there. He became connected with Harvard College, and two of his manuscript works—*A System of Logic* and *Compendium Physicæ*

—were used as text-books. He was made vice-president of the college at the establishment of that office, and hoped to succeed Increase Mather as president. His death prevented the fulfillment of this ambition. Consult Josiah Quincy, *History of Harvard University* (Cambridge, 1840).

MORTON, JAMES DOUGLAS, fourth Earl of (1530-81). Regent of Scotland. The second son of Sir George Douglas of Pittendriech, in 1553 he succeeded in right of his wife, Elizabeth, daughter of the third Earl of Douglas, to the title and estates of the earldom. He early favored the cause of the Reformation, and in 1557 was one of the original lords of the congregation. Sworn a Privy Councillor in 1561, he was appointed Lord High Chancellor of Scotland, January 7, 1563. As one of the chief conspirators against Rizzio (q.v.), he fled with his associates to England, but obtained his pardon from the Queen. Though privy to the design for the murder of Darnley, on the marriage of the Queen to Bothwell he joined the confederacy of the nobles against her. After Mary's imprisonment in the Castle of Lochleven, he was restored to the office of High Chancellor, of which he had been deprived, and constituted Lord High Admiral of Scotland. On the death of the Earl of Mar, in October, 1572, he was elected Regent of the kingdom. His rule, chiefly directed toward the benefit of the masses and toward the formation of a Protestant league with England, in anticipation of the union of the two kingdoms, made him obnoxious to many of the nobles, and as the young King, James VI., desired to assume the reins of government, Morton resigned the regency in March, 1578. Two months later, however, he obtained possession of the Castle of Stirling, with the person of the King, and for a time recovered his authority. Intrigue, however, was active against him; he was accused of having participated in the murder of Darnley, and was beheaded at Edinburgh, June 2, 1581, bearing himself with dignity and composure, and maintaining his innocence of 'art and part' in the murder of the King's father. Consult: Crawford, *Crown and State Officers of Scotland* (Edinburgh, 1726); Froude, *History of England*, ch. lxiii. (London, 1881-82).

MORTON; GEORGE (c.1585-c.1628). An English colonist in America. He was born in England, became a separatist, and removed to Holland with his brother, Thomas Morton, settling at Leyden, where for some years prior to 1620 he was an agent of the London Puritans. In 1623 he sailed for New England in the ship *Ann*, in charge of a party of new settlers for the Plymouth Colony. He remained at Plymouth several years, and then returned to England. The book known as *Mourt's Relation* (1622), which was the first published account of the New England settlement, comprising a journal of the first twelve months of the Plymouth Colony, has the name 'G. Mourt' subscribed to the preface, and for that reason has been ascribed to Morton. Careful investigators, however, among them Dr. H. M. Dexter, who reprinted the work with critical and historical notes in 1864, while agreeing that the name 'G. Mourt' evidently referred to George Morton, are inclined to think that the account itself was the work of Bradford and Winslow.

MORTON, HENRY (1836-1902). A distinguished American scientist and educator. He was born in New York, and was educated at the Episcopal Academy in Philadelphia and at the University of Pennsylvania. He first studied law, but afterwards took up chemistry, and in 1863 became professor of chemistry in the Philadelphia Dental College. In 1869 he took the chair of chemistry in the University of Pennsylvania. In 1870 he became president of the Stevens Institute of Technology, at Hoboken, N. J., toward the endowment of which he contributed over \$60,000. Dr. Morton conducted the photographic work of the eclipse expedition that went to Iowa in 1869. In 1873 he carried out a series of important investigations on the fluorescent and absorption spectra of the uranian salts, on the fluorescent hydrocarbon thallene, discovered by him in petroleum residues, etc. In 1878 he was a member of Henry Draper's eclipse expedition, and while a member of the Lighthouse Board (1878-85) carried out valuable experiments on electric lighting, fog signals, illuminating buoys, etc. His publications include numerous papers in scientific periodicals and the *Student's Practical Chemistry* (written jointly with Leeds and published at Philadelphia in 1868).

MORTON, JAMES SAINT CLAIR (1829-64). An American soldier, a son of Samuel George Morton (q.v.). He graduated at West Point in 1851, and from 1855 to 1857 was assistant professor of engineering in that institution. In 1860 he conducted an exploration for a railway route across Central America for the Government; in 1861 was promoted to be captain; in 1862 became chief engineer of the Army of the Ohio, and later in the year was transferred to a like position in the Army of the Cumberland. He commanded a brigade at Stone River, was wounded at Chickamauga, and was made major of engineers in July, 1863. As chief engineer of the Ninth Army Corps he participated in Grant's Virginia campaign, and was killed while leading the assault on Petersburg. In recognition of his gallantry in this engagement Congress voted, after his death, that he be ranked as a brigadier-general in the Regular Army. Previous to the war he published a number of works on fortification and engineering.

MORTON, JOHN (1420?-1500). Archbishop of Canterbury and cardinal. He was born in Dorset, and educated at Cerne Abbey, a Benedictine foundation, and at Balliol College, Oxford. Having studied law, he took orders and began to practice in the Court of Arches, the ecclesiastical tribunal of the Archbishop of Canterbury. Here he attracted the attention of Archbishop Bouchier, who presented him to Henry VI., and the latter made him a member of the Privy Council about 1450, and also gave him valuable ecclesiastical benefices. Though he had followed for a time the fortunes of the Lancastrians, Edward IV. took him into favor, made him Master of the Rolls in 1473, and in 1479 Bishop of Ely. He was not in favor with Richard III., who arrested him and committed him to the custody of the Duke of Buckingham, from whom he escaped and fled to the Earl of Richmond on the Continent. He is said to have suggested the union of the houses of York and Lancaster by the marriage of Richmond with the daughter of Edward IV. Henry VII. on his accession

made Morton a member of the Privy Council, and on the death of Cardinal Bouchier, in 1486, he was promoted to the See of Canterbury. In 1487 he was appointed Lord Chancellor, and in 1493 Pope Alexander VI. made him a cardinal. Morton was the chief counselor of Henry VII., and hence has been held responsible, perhaps unjustly, for Henry's avarice. (See Morton's FORK.) He died October 12, 1500. The history of Richard III. which bears the name of Sir Thomas More was probably written in Latin by Morton. At Ely he drained the fens by Morton's Dyke. Consult Hook, *Lives of the Archbishops of Canterbury*, vol. v. (London, 1867).

MORTON, JOHN (1724-77). One of the signers of the Declaration of Independence, born of Swedish ancestry, in Ridley Township, Chester County, Pa. He was a surveyor for some years, but subsequently became a lawyer. He was for several years a member of the Pennsylvania Assembly, and in 1765 was chosen a delegate to the Stamp Act Congress. From 1766 to 1770 he was high sheriff of Chester County. During all this period he continued to serve in the Pennsylvania Assembly, and from 1772 to 1775 was Speaker of that body. He was an earnest champion of the rights of the Colonies in the pre-Revolutionary controversies, and was active in furthering the cause of the Revolution after the outbreak of hostilities. In 1774 he was elected a member of the Continental Congress, and remained a member of that body until his death, taking a leading part in the debates and helping to frame the Articles of Confederation.

MORTON, JULIUS STERLING (1832-1902). An American political leader. He was born in Adams, Jefferson County, N. Y., and when two years old was taken to Michigan by his parents. He was educated in the Methodist Episcopal Academy at Albion, and in 1850 entered the University of Michigan. He completed his course at Union College, graduating in 1854, and in the year following settled in Nebraska, first at Bellevue and later at Nebraska City, where he founded and edited the *Nebraska City News*, the first newspaper to be established in the State. In 1856 and 1857 he was elected to the Nebraska Territorial Legislature, and in 1858 was appointed by President Buchanan secretary of the Territory, and became Acting Governor upon the resignation of Gov. W. A. Richardson, a few months later. In 1866 he was the Democratic candidate for Governor, but was defeated. From that time until 1881, when he was again a candidate for Governor, he took no part in politics. In 1893 he entered the Cabinet of President Cleveland as Secretary of Agriculture, remaining in office until 1897. Upon the advent of William Jennings Bryan into Nebraska politics he became one of his most active opponents, and identified himself with the Gold-Democratic wing of the Democratic Party. In 1901 he was appointed by President McKinley one of the United States Commissioners for the Louisiana Purchase Exposition. He was a student of forestry, and was the originator of 'Arbor Day' in Nebraska, the observance of which has extended to many other States. At the time of his death he was editing a weekly paper entitled *The Conservative*, in which he opposed most of the doctrines advocated in Bryan's *Commoner*.

MORTON, LEVI PARSONS (1824—). An American banker and political leader. He was born at Shoreham, Vt., and was educated at the academy in that town. In 1843 he established himself in a mercantile business in Hanover, N. H. In 1850 he removed to Boston, where he entered the banking business, and four years later he settled in New York City, where he was successful from the start. In 1863 he founded the banking-house of Levi P. Morton & Co., later Morton, Bliss & Co., which became one of the most successful private banking firms in the country. A London branch, Morton, Rose & Co., was subsequently established. In 1878 Morton was elected to Congress as a Republican. From the completion of his term until 1885 he was United States Minister to France. In 1888 he was the successful candidate for Vice-President on the Republican ticket. From 1894 until 1896 he was Governor of New York.

MORTON, MARCUS (1784-1864). An American lawyer and politician, born at Freetown, Mass. He graduated at Brown University in 1804, and at the Litchfield (Conn.) Law School, was admitted to the bar in 1807, and established himself in the practice of his profession at Taunton, Mass., where he remained for the rest of his life. From 1817 until 1821 he was a member of Congress. In 1823 he was a member of the Governor's Council, in 1824 was Lieutenant-Governor, and in 1825 began a notable career as judge of the Supreme Court. He remained on the bench until 1839, when he was the candidate of the Democratic Party for Governor, and was elected by one vote over Edward Everett, the Whig nominee, although the Whigs carried the State electoral ticket. In 1840 he failed of reelection, but in 1842 was again elected. From 1845 to 1848 he was Collector of the Port of Boston. In the same year he became a violent opponent of the Democratic policy as to slavery extension, and took a leading part in the organization of the Free-Soil Party, by which he was elected to the State Legislature for one term. Later he identified himself with the Republican Party.

MORTON, NATHANIEL (1613-85). An American colonial historian, born of English blood in Leyden, Holland. He came to Plymouth, Mass., in 1623, and dwelt there till his death. On the death of his father he was taken into the family of Governor Bradford, whose wife was his maternal aunt, and early helped the Governor in public business. He was Secretary of the Colony from 1645 till his death. In 1669, at the request of the commissioners of the New England colonies, he compiled and published at Cambridge, Mass., his *New England's Memorial, or a Brief Relation of the Most Remarkable and Memorable Passages of the Providence of God Manifested to the Planters of New England*, etc., a work which was reprinted in England and several times in the colonies, and was the chief authority for the events of which it treated until the discovery in 1855 of Bradford's *History of Plymouth*, on which, together with the journals of Winslow, Morton, who had little originality, drew largely. Morton also wrote a *Synopsis of the Church History of Plymouth* (1680), and obituary poems of the style then in vogue.

MORTON, OLIVER PERRY (1823-77). An American political leader, best known as the

'War Governor' of Indiana. He was born in Salisbury, Wayne County, Ind., August 4, 1823, attended the Wayne County Seminary, spent two years at Miami University, studied law, and in 1847 was admitted to practice. He soon became a prominent member of the Indiana bar, and in 1852 was elected circuit judge. He entered politics as a Democrat, but opposition to the Kansas-Nebraska Bill led him on May 2, 1854, to withdraw from the Democratic State convention; and ultimately he assisted in the formation of the Republican Party, to whose first national convention he was a delegate. In 1856 the People's Party, as the Republican Party in Indiana was at first called, nominated him for Governor, but after a close contest he was defeated. Four years later he was elected Lieutenant-Governor, and, upon the Governor's election as United States Senator, Morton became Governor, January 16, 1861. Upon the outbreak of the Civil War he threw himself with extraordinary energy and success into the work of raising troops. The election of 1862, however, resulted in the choice of a Democratic Legislature and Democratic State officers, who bitterly opposed the war, and threw obstacles in his way. His task was still further complicated by the presence in the State of a large secret society called the Knights of the Golden Circle (q.v.), which resisted the draft, encouraged desertion, and even plotted the assassination of the Governor and the carrying of Indiana out of the Union. But Morton triumphed over all difficulties. He borrowed sufficient money on his own personal responsibility to meet the exigencies of the situation; put down the treasonable associations and brought the leaders to trial; and he secured the triumph of his party and his own reelection as Governor in 1864. In the opinion of such men as Chase and Stanton his services during this period were greater than those rendered by any other of the great 'War Governors.' Shortly after the close of the war, Morton was stricken with paralysis, and was obliged to go to Europe. On his return to the United States, he resumed his duties as Governor. In 1867 he was elected United States Senator, and was re-elected in 1873. In the Senate he became a recognized leader of the Republicans, and, despite his poor health, accomplished a prodigious amount of work, serving on the committees on foreign relations, agriculture, military affairs, private land claims, and privileges and elections. At first an opponent of suffrage for the freedmen, he ultimately did much to promote the passage of the Fifteenth Amendment. He was one of President Grant's chief advisers, and sustained the Administration in the unsuccessful attempt to carry through the Senate the proposed treaty for the annexation of Santo Domingo. In return for this last service, the English mission was offered to him, but he refused it. In 1873, on the death of Chief Justice Chase, he declined also to become Chief Justice of the Supreme Court. At the Republican national convention in 1876 he was a strong candidate for the Presidential nomination, and received 124 votes on the first ballot. He subsequently served on the Electoral Commission (q.v.). At this time his infirmities were such that he required assistance in moving about, and had to be carried from the lobby of the Senate chamber to his carriage. He died at Indianapolis, November 1, 1877, as the result of an attack of paralysis. Morton possessed a powerful intellect,

a determined will, and high executive ability, and was an orator of great popularity and force. An admirable biography has been written by W. D. Foulke (2 vols., Indianapolis, 1899).

MORTON, SAMUEL GEORGE (1799-1851). An American physician and natural scientist. He was born in Philadelphia. He became a student of medicine under Dr. Joseph Parrish, and was assisted in his studies by Dr. Richard Harlan, the natural historian, from whom he imbibed the strong taste for general science which always distinguished him. He became a doctor of medicine in 1820, and after three years of European study received a degree from Edinburgh University. In 1824 he began practice in Philadelphia, and soon attained a prominent position. In 1839 he was appointed professor of anatomy in the Pennsylvania College at Philadelphia, which chair he continued to fill until 1843. Besides his contributions to medical literature Morton was always engaged in general scientific investigation and writing. While abroad he studied the geology of Scotland, and on his return presented to the Academy of Science a collection of the greenstone rocks of Scotland. In 1827 he published an *Analysis of Tubular Spar from Bucks County*, and in the succeeding year some *Geological Observations*. He was besides an ethnologist of wide fame, and possessed an immense collection of skulls from all races of the world. His medical works are: *Illustrations of Pulmonary Consumption* (Philadelphia, 1834); an American edition of Mackintosh's *Principles of Pathology and Practice of Physic* (Philadelphia, 1836); *An Illustrated System of Human Anatomy* (Philadelphia, 1839); and *Crania Americana* (Philadelphia, 1839).

MORTON, THOMAS (1564-1659). An English prelate, born in York, and educated at Cambridge. He was ordained a deacon in 1592, and became chaplain to Lord Huntingdon. Upon the death of Elizabeth he became chaplain to the Earl of Rutland. In his first work, *Apologia Catholica* (1605), he defended the Church of England and attacked the Jesuits, which he continued to do throughout his life. A royal chaplain, he was also successively Bishop of Chester, of Lichfield and Coventry, and of Durham. In 1641 he was mobbed by the people and was one of the twelve bishops impeached by the Parliament for high treason. Morton suffered four months' imprisonment and never resumed his seat in the House of Lords. His works include: *A Treatise of the Threefolde State of Man* (1596); *An Exact Discoverie of Romish Doctrine* (1605); *A Catholic Appeal for Protestants* (1610); *The Grand Imposture of the Church of Rome* (1628); *The Necessity of Christian Subjection* (1643); and *A Treatise of the Nature of God* (1669).

MORTON, THOMAS (c.1590-1646). An English adventurer, by profession an attorney. He visited New England with Weston's expedition in 1622; and in 1625 he returned with Captain Wollaston's colony, which settled at Mount Wollaston, within the present limits of Quincy, Mass. After Wollaston's departure to Virginia the next year, Morton ousted Fitcher, who had been left in charge, and changed the name of the settlement to Ma-re-Mount or Merry-Mount. He began to trade with the Indians, and the settlement became the rendezvous for the reckless and disso-

lute. In 1627 he erected a May-pole eighty feet high, and the revels lasted for days. When this and the fact that he was supplying the Indians with firearms in defiance of King James's proclamation of 1622 became known at Plymouth, a remonstrance was sent to him. In 1628 he was captured by Capt. Miles Standish and sent back to England with charges. There he ingratiated himself with Sir Ferdinando Gorges. Meanwhile Endecott visited Merry-Mount, cut down the May-pole, and renamed the place Mount Dagon. In 1629 Morton returned to Plymouth and to Merry-Mount. In 1630 he was again arrested after several unsuccessful attempts, and was placed in the stocks, while his house was burned, and his property seized, on a charge of disorderly conduct and oppression of the Indians. When sent to England he again joined the Gorges claimants and furnished much information against the Massachusetts Colony. When the New England Council surrendered its charter in 1635 and divided the territory, Morton was appointed solicitor to press the confirmation of the deeds and the revocation of the Massachusetts charter. Only want of money prevented the destruction of the colony. In 1637 he published the *New English Canaan*, which had probably been written in 1634-35. The first part is an account of the Indians, the second a description of the country, and the third a confused, somewhat humorous account of the 'precise separatists' of Plymouth and Massachusetts Bay. In 1643 he again appeared in Plymouth, and remained through the winter. He then appeared in Maine and Rhode Island. In 1644 he was captured by the Massachusetts authorities, kept in prison a year, and fined £100 on charge of having made a complaint of the colonies to the council. He was released without payment of the fine, and died in Maine. Morton's life and his settlement at Merry-Mount form the subject of John Lothrop Motley's novels, *Morton's Hope* (1839) and *Merry-Mount* (1849), and one of Hawthorne's short stories is entitled *The Maypole of Merry-Mount*. Motley's book has been reprinted with an elaborate memoir and full notes by C. F. Adams, Jr., in the "Prince Society Publications" (Boston, 1883). Consult Adams, *Three Episodes in Massachusetts History* (Boston, 1892).

MORTON, WILLIAM JAMES (1845-). An American physician, son of William T. G. Morton, the introducer of ether anæsthesia. He was born in Boston, Mass., educated at the Boston Latin School, and graduated at Harvard in 1867. He engaged in teaching for a year, and then entered the Harvard Medical School, where he graduated in 1872, taking the Boylston prize for his thesis on Anæsthetics. After a hospital experience he engaged in practice in Bar Harbor, Maine, and in Boston. From 1873 to 1874 he pursued his studies at Vienna, going from there to Kimberley, in South Africa, where he built up a large practice and engaged in diamond mining. After two more years of European study he returned to America and settled in New York. Here he was for a time editor of the *Journal of Nervous and Mental Diseases*; was adjunct professor of nervous diseases at the New York Post-Graduate Medical School from 1882 to 1885; neurologist to the New York Infant Asylum from 1887 to 1890. Since 1890 he has been professor of nervous diseases and electro-

therapeutics at the New York Post-Graduate Medical School. Dr. Morton's name has been intimately connected with the recent advances in electro-therapeutics, and he has contributed not a little to the advancement of this science. In 1880 he devised a mechanism consisting of a Holtz machine and Leyden jars by means of which a new variety of electric current was established (condensed currents in rapid discharge) and named by him the 'static induced current.' By the aid of this Morton current, as it is called in the scientific world, the X-ray can be produced, and Dr. Morton probably made the first X-ray picture in this country. He has made many contributions to medical literature, and is a member of numerous scientific bodies. He is a member of the State and county societies; of the New York Academy of Medicine; was president of the New York Neurological Society in 1874; of the New York Electro-therapeutic Society in 1894; of the American Electro-therapeutic Association in 1893; and is a member of several foreign societies.

MORTON, WILLIAM THOMAS GREEN (1819-68). An American dentist, exploiter of the general anæsthetic properties of sulphuric ether. He was born at Charlton, Mass. In 1840 he took up the study of dentistry at the Baltimore College of Dental Surgery, then recently established by the new Society of American Dental Surgeons. On his return to Boston in 1842 to practice Morton's attention was drawn toward medicine, and in 1844 he began study with Dr. Jackson of Boston, and continued in the Harvard Medical School. He did not complete his course, but was afterwards awarded the degree of M.D. *honoris causa* by the present College of Physicians and Surgeons, Baltimore. The art of dentistry was at that time in a transition stage, and Morton's inventive genius discovered many improvements, especially in attaching false teeth. He first devised a new solder by which teeth could be attached to gold plates, and further contrived to obviate dependence upon old fangs in inserting new teeth. The removal of these stumps or roots was attended with great pain, and alcoholic stimulation, laudanum, and the galvanic current were tried to diminish it, without avail. In the course of his investigations Morton became acquainted with the value of sulphuric ether as a local anæsthetic and used it in minor operations. After a long series of experiments on animals, he finally succeeded in proving the efficacy of vaporized ether, and making known his results to Dr. John C. Warren, he administered ether at the latter's request in the Massachusetts General Hospital, the operation being that of removing a tumor from the jaw. The first public demonstration was made October 16, 1846. At the suggestion of Dr. Oliver Wendell Holmes the new form of narcosis was christened 'anæsthesia.' Dr. Morton obtained a patent for the use of ether, under the name of 'letheon,' in 1846, a month after the operation in the hospital, and a month after this, in England, Dr. C. T. Jackson also claimed the honor of having made the discovery, and the Montyon prize of the French Academy was equally awarded to Dr. Morton and to Dr. Jackson, but Dr. Morton declined to accept it, which resulted in his receiving in 1852 the large gold medal, the Montyon prize in medicine and surgery. He claimed compensation from Congress

for his invention, the Government having used it, and also from individuals, and he was involved in many suits. He received, however, no compensation, and his life was spent in contests, literary and legal, in regard to his invention. Memorials were presented to Congress signed by many physicians, but for one reason or another they failed to secure what was asked.

MORTON'S FORK. A famous dilemma said to have been proposed by the Chancellor of Henry VII. of England, John Morton (q.v.). In 1491 Henry resorted to the unconstitutional method of obtaining money by a benevolence (q.v.), and Morton in carrying out the scheme is supposed to have told those who lived well that their opulence was proved by their large expenditure; while those who spent little were told that they must have saved considerable by their economy. Either class could well afford to assist the sovereign.

MORTUARY CUSTOMS. Observances connected with death and burial. The care of the dying and of the dead is a marked feature of religion among all peoples, from the lowest to the highest, and is associated most closely with spirit belief and custom. It is possible to treat the subject ethnically, enumerating and classifying peoples by their mortuary customs, or culturally, studying the genesis and development of each class of actions and beliefs involved. The latter method is here adopted. Mortuary customs, for the convenience of study, may be considered under the following heads, which by their characteristics as well as by their presence or absence are worthy of note.

- (1) Customs concerning the dying.
- (2) Treatment of the corpse, including the posture of the body, bathing, cutting, decapitating, embalming, or cremating the corpse, or scraping the bones.
- (3) Clothing or wrappings of the corpse.
- (4) Incasement of the corpse in the crate, basket, jar, box, or other receptacle which may answer to the coffin. In this, protection and convenience of carrying are the ends desired.
- (5) Watching the corpse, including the wake and funeral feast.
- (6) Bearing the corpse to the place intended for it, the funeral, with all its apparatus, processions, and rites.
- (7) Disposal of the corpse.
- (8) Post-mortem ceremonies, passing under the general term mourning.
- (9) Cult of and for the dead, beliefs about the dead, the ghost, necromancy.
- (10) Memorials for the dead, mementos preserved or worn, and monuments of every kind.
- (11) Ascriptions to the dead, epitaphs, mortuary sayings, and literature.

CUSTOMS CONCERNING THE DYING. In the belief of the lower races, death from natural causes is a thing unknown; it is always the act of some god or personage, designed and chiefly malevolent. Every disease and every death among the Polynesians is held to be caused by the gods for some crime against taboo or as the result of some offering by an enemy. Hence the neglect and cruel treatment of the sick. Even death caused by poison is thought to be due to the displeasure of the gods.

Care for the dying can scarcely be said to exist among savages, although the most strenuous

efforts of the magician and friends are put forth to exorcise the destroying angel and thus to restore the patient. The moment hope has departed, the preparations for burial are begun almost before the breath has left the body. So strong is the belief in the necessary connection between magic and death among the Australians that when a man believes he has been 'pointed at' or run through with a magic spear that has been 'sung' he frequently dies. Well authenticated cases are on record in which the slightest ailment or wound has resulted fatally, because the victim was convinced that the instrument had been charmed by magic. For many forms of conjuring there is no remedy. In others a cure is possible by the aid of a magician belonging to the totem of the person who 'pointed' at the sick man. The practices of the medicine men are almost universally the same. They make the same passes, suck the wound, and mutter incantations, and the imagination of the patient often effects a cure.

TREATMENT OF THE CORPSE. No sooner has life become extinct than the preparation of the body begins. For economy's sake most primitive tribes double the corpse into the smallest compass, the chin resting on the knees. Even among such an advanced people as the ancient Peruvians this custom of packing the body into the smallest compass prevailed, a strong rope being used to draw the limbs into place and bind them fast. It has been said that the motive in this is to imitate the posture of the unborn infant, but aside from the fact that crouching is a common position in life among savages, economy of space in the grave or tomb has much to do with the custom.

Embalming the dead was at first only a natural process. There are regions where the arid climate desiccates all flesh, as on the plains of the West, and in Peru, Egypt, and Arabia. Here, the drying up of the body suggested to the primitive mind religious ceremonies which found their culmination in the all-absorbing mortuary cult of Egypt. The Polynesians when first discovered had an elaborate ceremony of embalming their dead priests. The brains and intestines were removed, and all moisture was carefully wiped from the body, which was anointed with fragrant oils and dried in the sun. It was then clothed and seated in a little house erected for the purpose, where a table was set, before it for food, fruits, and flowers. Here also belong such ceremonies as calling the dead, anointing, closing the eyes and lips, bathing, kissing, placing coin in the mouth, all of which have symbolical meanings with reference to the future well-being of the dead, as well as to the immediate relations of the ghost with the living.

CLOTHING OR WRAPPINGS OF THE CORPSE. Scarcely any people consigns its dead to the last resting place naked. The corpse is clad either with the clothing worn in life, or the best attire, or special grave cloths, shrouds, or winding sheets. Furthermore, masks are frequently placed over the whole body or over the face. Among the very lowest peoples the corpse may be put away naked, but this takes place only among those tribes that wear no clothing. The preparation of a special shroud has its prototype even among very primitive races, and begins with the chiefs or leading men, who in life wear an

official or professional dress. The order of the development of cerements seems to have been first, the disposal of the body naked; second, dressing the corpse as in life in order to take up the new life in the spirit world at once; third, arraying it in its best clothing, to make a good impression on the ghosts among whom it goes; fourth, wrapping it in a shroud for sentimental reasons. Among the Egyptians the corpse was wrapped with narrow strips of linen. In Turkestan a similar practice is now in vogue, in Kimbondo leather is used, and in Mashonaland the toes and fingers are tied up each in a separate piece of cloth.

INCASEMENT OF THE CORPSE. The receptacles for the dead body are of many sorts. Among the ancient Aleuts the corpse was doubled up and fully clothed. It was then crated, hung on the wall of a cave, or set in a safe place on the floor. The Eskimo employ tough walrus hide as a case for the dead. The Pacific Coast tribes, wherever the giant cedar grows, make boxes or hollow logs for the corpse. The Plains Indians crated the bodies of the dead and all their belongings before placing them on the platforms, and the old cave people of Utah packed them in burden baskets.

The Southern Indians made hurdles of cane and rolled them about the corpse. Farther south no coffin was needed, for the bodies were exposed in *quiobogons* or dead houses until the flesh was gone, after which the bones were buried in the earth or in jars. Some of the ancient mound-builders made a stone box or coffin in the grave for the bones.

A common motive among primitive tribes in using the coffin was to hold the bones together for burial. Custom demanded it, and the ever watchful and jealous ghost required it. Again, the coffin or its substitute guarded the corpse from ravenous beasts and birds of prey, and it may also be possible that among some tribes the dead are boxed up to prevent them from escaping or being spirited away by unfriendly ghosts. In many tribes the habitation motive prevails; the coffin or tomb is regarded as the house of the dead.

WATCHING THE CORPSE. Between death and burial the spirit or the double of the dead hovers around the body, and expects the most rigid adherence to custom. This belief is the origin of the widespread custom of *lykewake*, or watching the corpse. Among many primitive tribes the dead are not hurried to burial, but the ceremonies of mourning begin around the corpse. The Polynesians placed the body of the dead on a bier-like frame covered with white tapa, which was decorated with flowers, or upon a bed of fragrant leaves. Relatives sat around lamenting and cutting themselves with sharks' teeth. Vigils about the dead are widespread among the white races. The folk-lore of the civilized abounds in customs during the day or two that intervene between death and burial. The watch feast, or wake, has dwindled to a company of a few friends. Salt is placed on the breast of the dead, a candle burns night and day at the head of the coffin. The sin-eater takes bread and publicly devours it for the misdeeds of the deceased.

REMOVING THE CORPSE TO THE PLACE INTENDED FOR IT. The funeral proper is one of the most solemn of rites the world over. Among many tribes the corpse must be taken out of the dwell-

ing through the roof or by some roundabout way, in order that the ghost may get bewildered and not return. The procession to the grave, among savages, has changed little in the course of centuries. Usually, mutilations of a more or less cruel character are then observed by certain persons, while among other tribes only a small number carry the dead away and are thereafter unclean.

DISPOSAL OF THE CORPSE. The disposal of the corpse does not necessarily mean interment. We may distinguish five methods which have undergone countless modifications as outgrowths of race, climate, soil, and grade of culture. (1) *Exposure*.—The bodies are not sealed up, but are left to destruction on the ground (rare), or are hidden in clefts, caves, or grottoes; in the hut where the death took place; on trees, posts, scaffolds, or platforms; in boxes or canoes; in log pens, or dead houses; or in Towers of Silence. (2) *Aquatic Burial*.—The corpse is placed on the water or under the water, as among the Hindus, who consign dead bodies to the Ganges. (3) *Inhumation*.—The corpse is buried in a single grave, which is often shelved or recessed; in pits or Golgothas; in cairns, or under mounds or tumuli; under the floor of the home or in consecrated structures. (4) *Encysted*.—The body is inclosed in rude boxes of wood, stone, or other materials, which are placed in dolmens, vaults, sepulchres, house-tombs, kistvaens, or mausoleums. (5) *Cremation*.—The corpse is burned and the ashes are abandoned, scattered, buried, boxed, or inurned.

In this connection belongs the custom of making deposits with the dead. No other part of this complicated series of customs comes so near to the world of shades. Thus in Dahomey the bodies of wives and slaves were sacrificed without number, and in the days of knighthood the horse and armor accompanied the warrior. It is through these relics found with the dead that archaeology is to a large extent possible. Most extinct peoples were without the art of writing; but stone implements, pottery, objects in bone and metal, and even textile fabrics reveal enough to enable the archaeologist to reconstruct ancient society. Among some American tribes articles of use were punctured or broken before being placed in the grave. One of the tribe who robbed a grave would not be tolerated, but an inimical tribe might be tempted. The Polynesians would rob sacred inclosures of the enemies' dead in time of war and steal the bones of distinguished men to make tools, fish-hooks, and other degrading implements. To avoid this, bones were carried to the caverns far away and hidden in clefts of rocks. In the Fiji Islands favorite wives as well as slaves were strangled on the death of a chief in order that they might wait upon him and be happy with him in the spirit world. To this they gladly submitted, not only in the prospect of greater happiness, but to avoid unspeakable miseries in after life.

POST-MORTEM CEREMONIES. These may be grouped together under the general head of mourning, including both what is done and what is left undone in dress, conduct, etiquette, and rites. As soon as a burial takes place among the Australians and other savage races, the camp is burned down, everything in it is destroyed, and the people move to another place. During the mourning period no person may mention the

name of the dead except in case of necessity, when it must be done in a whisper for fear of annoying the ghost. If the ghost should hear the name mentioned it would come to the conclusion that the relatives were not properly mourning, and they would be in consequence liable to his vengeance; for, if their grief were genuine, it would cause them too much pain to hear his name mentioned to allow them to speak it.

Many seemingly absurd customs about the graves or tombs of the dead are easily explained when it is kept in mind that the dead are not regarded as really dead. Putting rags or parts of torn clothing about the tombs, or on trees near by, as a notice to the ghost that the appropriate rending of garments had taken place, is one of these customs. A complete list of them would fill a volume. It is enough to mention the tolling of bells, choice and fashions of mourning, cutting one's flesh, calling the dead, turning pictures toward the wall, feeding the dead, scrupulous care of the grave, hired mourners, and the imperative customs as to who shall mourn, when, how long, and how, sacrifices at the grave, naming the dead, and the widow's lot.

CULT OF AND FOR THE DEAD. The ghostly world of savages is never far away. The anthropomorphism of nature does not end with this life. The dead go at once to some place on the earth or under the earth where the most congenial occupations are renewed. When the ghost of the Polynesian leaves the body it is drawn out through the head as the sword is pulled out from the scabbard. Evil powers also lie in wait for the ghost to seize it when it is drawn out. Arriving safely at the place of the blessed, it is devoured by the gods, cannibalism being in full vogue above.

Not in savagery only, but in all races, ages, and grades of culture this belief in the nearness of lost ones is held. More than this, reincarnation and metempsychosis are believed to be possible. The savage woman complacently murders her babe thinking that the same one will enter into the mother's womb and be born again. As the dead are not considered dead, but are even more powerful as ghosts than they were as men, a complex and wide-reaching cult of almost universal extent has been evolved, which has for its object the propitiation and gratification of the spirits of the dead. See **DEMONOLOGY; GHOSTS.**

MEMORIALS FOR THE DEAD. Combined with the fear of the dead is a desire, primarily, perhaps, based on anxiety to propitiate the ghost by a proof of suitable mourning, and later founded on real affection, to preserve the memory of the departed. The Andamanese widow carefully dries the skull of her deceased husband, paints it with ochre, decorates it with rude lace-work, and wears it for a memorial about the neck. Analogous synecdochic preservation of the dead is almost universal among primitive peoples. The Eskimo place by the side of the grave the huge jaw of a whale. The Northern Pacific tribes set up great posts of cedar. The ancient people of the Mississippi Valley built mounds of earth and stone. In Easter Island images cut in lava were memorials. The Tahitians set up little models of their houses about six feet high where the body of a chief clothed and rubbed with aromatic substances was laid while offerings were made. These all tell the same story. As culture advanced

monuments (q.v.) became more elaborate, and the modern cemetery differs from the primitive memorials in degree rather than in kind.

ASCRPTIONS TO THE DEAD. The custom of eulogizing the dead is extremely primitive and ancient. The Polynesians had professional bards who composed elegies which were committed to memory and preserved. These were recited on special occasions when the dead were mentioned. The American Indians had a solemn style of speech for such occasions quite above the grasp of the ordinary man, while the great epics of Greece and Rome abound in passages over the dead of deepest pathos. Here, too, belong the entire body of epitaphs, or memorial inscriptions placed on tombs in honor of the dead who are laid in them. See **BURIAL**.

MORVI, mōr-vē'. A native Gujarat State of Bombay, India, on the Kathiawar Peninsula. Area, 821 square miles. Population, estimated at 106,000. Capital, Morvi.

MOSAIC (ML. *mosaicus*, Gk. *μουσαϊος*, *mou-saios*, mosaic, artistic, relating to the Muses, from *μουσα*, *mousa*, Muse). A branch of fine art which was especially prominent during the Middle Ages, though not unknown to antiquity, and is still practiced to a limited extent. Mosaic work, when it attained full growth, had various branches. It was used: (1) on floors; (2) on walls; (3) on detached objects, monuments or furniture. It consisted of the grouping of pieces of marble, glass, or enamel so as to form ornamental or figured compositions. In the *opus sectile* the thin marble plates were cut so as to follow the outlines of the design, and it is not properly a branch of mosaic. *Opus tessellatum* is the best technical term, the *tessellæ* meaning the small cubes forming the mosaic. Marble cubes were used for floors altogether, though glass was occasionally mingled with them in the Middle Ages. For wall compositions, architectural details, and furniture, though marbles were at first used almost exclusively, the possibility of producing a greater variety of shades in artificial enamels led to their exclusive use on walls as early as the fifth century and in furniture after the eleventh century. The cubes used for figures were usually smaller than those used for decorative work. Some are as small as three millimeters, more than one hundred thousand being contained in a square meter. Gilt cubes were made by inclosing the gold leaf between two pieces of white glass. The cubes were colored with metallic oxides. Colored glass was first cut into long narrow sticks and these again broken into the cubes, which were sorted into their separate cases, according to colors and shades, like printers' type. To execute a wall composition the mosaicist prepared his cartoons; the mason plastered as large a section of the wall as could be covered in a day; the mosaicist stenciled or dotted his cartoon on to the wet plaster and then rapidly fastened to it the mosaic cubes. The surfaces were flattened, washed, and burnished. In the best work the cubes are not absolutely even or adjacent, so that mechanical effects are avoided.

ORIGIN. The Greeks before Alexander apparently did not practice any kind of mosaic work; it first appears in the Alexandrian age, and probably originated in Egypt. It came into prominence for its reproductions in permanent form of famous paintings on the floors of public

and private buildings. We even hear that scenes from the Trojan War were represented on floors of the great ship of Hiero of Syracuse. A famous floor at Pompeii represents in a grand composition a scene of Alexander's victory at Issus, full of action and variety. Even larger and more complicated is the Nile scene of a floor found at Palestrina, with its inundated city, its fishing and other genre scenes.

ROMAN MOSAICS. Although the Romans were not ignorant of the use of glass cubes on walls, they never developed this branch of mosaic work; the fountains and niches at Pompeii and Ostia are almost the only surviving examples. But in their pavements they showed the greatest variety, from the simple crude geometric designs in black and white to the exquisite gradations of color and form in such works as the Capitoline doves, the landscapes from Hadrian's villa in Rome and Berlin, the Pompeian actors by Dioscorides in Naples, the portraits of poets and philosophers at Cologne, and many more. Midway between stand such colossal works as the gladiator pavement of the Baths of Caracalla. Roman mosaic pavements of artistic value have been found not only throughout Italy, but in France, Spain, Germany, Hungary, North Africa, Syria, and Asia Minor.

EARLY CHRISTIAN. In the fourth century, Christian artists perceived the value for church interiors of the rich coloring and permanency of mosaic. No form of painting harmonizes so well with architecture. Mosaics were placed nearly always in the apses and on the triumphal arches of the early Christian basilicas, and in important cases upon the walls of the nave, and sometimes both on the inside and outside walls of the façades. The interiors of mausoleums and baptisteries were covered with them on dome, walls, and apse. While the upper part of the walls was decorated in this way with figured mosaic composition, the geometric mosaics or *opus sectile* were used on the dadoes below, and the marble geometric mosaics covered the floors. In the later Middle Ages, the twisted columns, sepulchral monuments, altar canopies, pulpits, choir screens, and other details were entirely inlaid in geometric designs, in the East and in Italy. The wealth of works is concentrated in Italy and in the purely Hellenic world. Rome and Ravenna had special schools with offshoots at Naples, Milan, Grado, and Parenzo. Constantinople and Thessalonica, also, were independent centres, radiating over Greek lands.

Rome preserves the earliest Christian works at Santa Costanza, similar to Catacomb frescoes, and at Santa Pudenziana, the counterpart of the Christian sarcophagi with Christ and the Apostles. The earliest series where mosaic painting attempts a great scheme of subjects taken from the Old and New Testaments is in Santa Maria Maggiore in Rome, on apse, triumphal arch, and nave. The mosaics over the chancel arch of Saint Paul's, representing subjects from the Apocalypse, date from the fifth century. In both cases the composition is still confused, the art has not yet found itself. It was from Greek artists that the solution came, in the introduction of the uniform gold background, against which the figures stood out clearly, as compared with the old white ground. At Ravenna we see this style in its earliest glory in the two baptisteries (fifth century), and especially in the mausoleum

of Galla Placidia (440) and later in the Church of Sant' Apollinare Nuovo (c.500-550). The latter monument has its entire main walls covered with a triple row of mosaics. Thoroughly Greek also is the culminating work of the sixth century, the decoration of San Vitale, also at Ravenna, with its two great historic panels of Justinian and Theodora, the Byzantine court and the ecclesiastical grandees.

Meanwhile the Roman school had somewhat fallen from its supremacy, for the only great work after Saint Paul's was the mosaic of Saints Cosmas and Damian (530), after which Rome suffered from the wars between the Goths and Byzantines and the attacks of the Lombards. The decline reached Ravenna in the seventh century, as is shown at Sant' Apollinare in Classe, and continued in Rome, with Italo-Byzantine stiffness, as in the works at San Lorenzo, Sant' Agnese, and San Venziano. The coloring is still superb, but the figures are rigid and staring.

MEDIEVAL. The Carolingian era saw a revival in both East and West about the year 800, which lasted for less than a century in Italy, but continued in the East from Basil the Macedonian to the capture of Constantinople by the Crusaders in 1204. In Rome the mosaics of the Church of Santa Prassede, especially the scenes from the Apocalypse, are a masterpiece, while Santi Nereo ed Achilleo and San Marco are of secondary importance. The art did not then spread beyond Rome, as in the earlier period. Only in the Orient was it still supreme. The real revival of the art in the West came in the eleventh century and was due to Byzantine influence and imported Byzantine artists. The two great schools were that of Sicily and Campania, with its masterpieces of Cefalù, Palermo, and Monreale, and that of Venice, represented at San Marco, Torcello, and Murano. In variety of subject, in splendor of color, and in sheer amount, these works surpass the mosaics of the fifth and sixth centuries.

The Roman school took part in this revival, but mingled antique traditions with Byzantinism, and retained a freedom and beauty of decoration and detail foreign to the other schools. It can best be studied at San Clemente, Santa Maria in Trastevere, Santa Maria Maggiore, and Saint John Lateran. In some of these works we can trace the first steps in the great revival of painting usually connected with the names of Cimabue and Giotto.

PAVEMENTS AND DECORATION. Meanwhile the mediæval mosaicists had been executing pavements far more beautiful than any geometric floors of antiquity. The Byzantine school, as usual, took the lead, and the exquisite designs and coloring of the pavements of San Marco and the Torcello Cathedral at Venice are but repetitions of the pavements of the churches of Constantinople, Saloniki, Mount Athos, Chios, and elsewhere. The Italian school, though centring at Rome, did similar work in Campania and Sicily. The small marble cubes were worked in patterns around large circular, square, long, or polygonal slabs of porphyry, serpentine, verde antico, rosso antico, or other rich marbles which formed the centre of each design.

It was not long before the geometric designs of the floors were transferred to the various details and objects in the church interiors, thus forming a perfectly harmonious whole. The

altar fronts and canopies at Ferentino, the canopies at Santa Cecilia and San Paolo at Rome, the choir seats at Civit  Castellana and San Lorenzo at Rome, the pulpits at Alba Fucense, San Lorenzo, Palermo, Salerno, and Ravello, the choir screens at the two latter cathedrals and at Alba, the Paschal candlesticks at Anagni, Ferentino, Santa Cecilia, and Salerno, the episcopal thrones at San Lorenzo and Fondi, the sepulchral monuments at San Francesco in Viterbo, at the Cathedral of Perugia, at Orvieto, at Assisi, Rome (Santa Maria Maggiore, Sopra Minerva, Ara Coeli, etc.), are a few among hundreds which made the interiors of churches wonderfully rich in this part of Italy.

The geometrical mosaic patterns even invaded the field of architecture. The portals were surrounded by it; it formed the main decoration of the colonnaded porticoes, and even of the cloisters. The cloisters of San Paolo and of the Lateran at Rome would lose all their beauty if their columns and friezes were divested of the color and design given by these mosaics. Even Tuscan church architecture felt this influence to the extent of obtaining a faintly similar effect by *opus sectile* with broader design—as at Pisa (baptistery) and San Miniato, near Florence.

None of the European countries besides Italy and Greece used mosaics. An occasional work is found in Germany, France, or England; but, as at Westminster Abbey, it is the work of an Italian or a Greek. Only in Russia, as at Kiev and Novgorod, can we trace the existence of a regular branch of the art.

MOHAMMEDAN. The art passed from the Byzantine Greeks in the East to the Mohammedans, and was used by them for pavements and the revetments of walls in nearly all the schools, but especially in Egypt, Spain, and Syria. Figured mosaics were substantially forbidden by the law of the Prophet, so that decorative, and especially geometric, patterns were alone used. Mosques, fountains, palaces, baths, and other buildings, between the tenth and fifteenth centuries, had them in profusion. The mosques of Cairo (see MOSQUE) contain an unbroken series which is paralleled in the old Coptic churches of the city. It is probable, in fact, that most of the mosaicists of the mosques were Christian Copts. The Alhambra at Granada contains dados of this geometric ornament, though here and in Syria, and especially in Persia, it was less used than the enameled tiles.

MODERN. With the rise of the Giottesque school early in the fourteenth century the golden age of mosaic painting ended, frescoes taking its place. Such works as appear on the facades of Orvieto and Siena cathedrals by Orcagna and his contemporaries in the fourteenth century are purely decorative. Henceforth mosaic loses its individuality, and seeks to imitate the delicate soft tones of fresco and then of oil. Great artists like Raphael (Santa Maria del Popolo, Rome), Titian, and Tintoretto (San Marco, Venice) furnished cartoons to be carried out by mosaicists, who are no longer artists, but mechanics. The atelier of the Vatican, busy producing altar-pieces for Saint Peter in exact imitation of masterpieces in oils, multiplying shades and minimizing the size of the mosaic cubes, has perfected this mechanical method. The atelier at Venice is the only other

modern centre of importance. These modern artisans, in their restorations of mediæval mosaics, have done immense damage by trying to 'improve' on the originals, setting the cubes closer together and with greater regularity and smoothness, thus ruining their art. They have long since abandoned the method of working directly on the wall, which had previously been universal, and they either set the cubes, face up, in portable compartments, which when filled are covered with linen prepared with glue and then transferred to the wall, the linen or paper being then wet and removed, or else they set the cubes, face down, directly on the adhesive paper or linen, on which the design is marked, with similar frames, and then effect the transfer to the prepared wall.

BIBLIOGRAPHY. The subject of mosaics is well treated in Woltmann and Woermann, *History of Painting* (Eng. trans. New York, 1880); a good general monograph is Gerspach, *La mosaïque* (Paris, 1885). The technique is carefully described by E. Müntz in *La mosaïque chrétienne* (Paris, 1893). All the mosaics of the Roman churches are reproduced in large colored plates and described by De Rossi, *Mosaici cristiani di Roma* (Rome, 1876-94). The same has been done for those of Saint Mark's in Venice by Organia in *La basilica di S. Marco* (Venice, 1881-88); for Monreale by Gravina, *Il duomo di Monreale* (Palermo, 1859). All the figured mosaics earlier than A.D. 900 are outlined and described in Garrucci, *Storia dell' arte oristiana* (Prato, 1873-81). Consult also: Pohl, *Die altchristliche Fresko- und Mosaikmalerei* (Leipzig, 1888), and Kurth, *Die Mosaiken der christlichen Aera* (ib., 1902 et seq.).

MOSAIC DISEASE. See TOBACCO.

MOSAIC WOOL. See RUGS.

MOSASAURIA (Neo-Lat., from Lat. *Mosa*, the river Meuse + Gk. *σαῦρος*, *sauros*, lizard). An order of extinct marine reptiles—the *Pythonomorpha* of Cope. The reptiles possessed the slenderness of a snake combined with strong paddles, such as those of the whale, together with many lizard-like characters. The first specimen of a nearly perfect head skeleton was discovered in 1780 in the upper chalk of Saint Pietersberg, in Holland, on the Meuse River. A few other specimens have been found in the Cretaceous of England and Europe. In North America this reptile seems to have attained its most flourishing existence, for over fifty species, included in several genera, have been found. The Cretaceous of New Jersey has yielded fifteen species. The Yale College collection contains a great number of specimens. *Mosasaurus princeps* from New Jersey is estimated to have been 40 feet long, and *Tylosaurus dyspeler* from Kansas was about 30 feet in length. Consult: Marsh, "Cretaceous Vertebrates of the West," *United States Geological Survey Reports* (Washington, 1875); Lucas, *Animals of the Past* (New York, 1901).

MOSBY, mōz'bi, JOHN SINGLETON (1833—). An American soldier in the Confederate service, born at Edgemont, Powhatan County, Va. He was educated at the University of Virginia, studied law, and was practicing his profession at Bristol, Washington County, Va., at the outbreak of the Civil War. After serving under Joseph E. Johnston in the Shenandoah Valley, in the win-

ter of 1861-62, he was appointed by Gen. J. E. B. Stuart an independent scout, and guided that officer's cavalry in a bold raid in the rear of McClellan's army on the Chickahominy, in June, 1862. Returning to Richmond after a short captivity early in 1863, Mosby recruited an independent body of cavalry for scouting and raiding purposes, and he then began his remarkable career as a 'partisan' leader of an irregular force known as rangers, with which, until the close of hostilities, he operated in Virginia and Maryland. His force was subsequently organized as a regular branch of the Confederate service as the Forty-third Battalion of Virginia Cavalry. His most brilliant exploit was the capture, in March, 1863, of Brigadier-General Stoughton, U.S.A., at that officer's headquarters at Fairfax Courthouse, which he accomplished by a raid inside the Federal lines. Promoted to be major as a reward for this capture, he followed Lee's army into Pennsylvania in June, 1863, and worried the flanks of the Federal army as it moved southward after Gettysburg. In January, 1864, he was repulsed with considerable loss in a night attack on Harper's Ferry. In May he harassed the rear of Grant's army as it advanced on Fredericksburg, and later made a long raid in Maryland. In August he made one of the most important captures of his career, consisting of Sheridan's entire supply train, which he surprised near Berryville. The loss was such a heavy one to Sheridan as to compel him to fall back on Harper's Ferry. In September he was wounded at Falls Church, but in the following month was again in the saddle, captured two Federal paymasters with \$168,000 in greenbacks, tore up the Baltimore and Ohio Railway tracks, destroyed rolling stock and made a prisoner of Brigadier-General Duffié. In December, 1864, he was promoted to be colonel. After being disabled for a short time by a wound, he continued his operations until Lee's surrender, when he disbanded his troops, gave himself up, and by General Grant's intercession was paroled. After the war he opened a law office at Warrenton, Va., and became a member of the Republican Party, which he thought could best settle the question of reconstruction satisfactorily. From 1878 to 1885 he was United States Consul at Hong Kong. On his return to America he established himself in law practice in San Francisco. He published an account of his exploits entitled *War Reminiscences* (1887). Consult also: Scott, *Partisan Life with Mosby* (New York, 1867); Crawford, *Mosby and His Men* (1867); Williamson, *Mosby's Rangers* (New York, 1896).

MOSCHELES, mō'she-lēs, FELIX (1833—). An English painter and author. He was born in London, and studied art in Paris and under Van Lerius in Antwerp. Afterwards he exhibited in Antwerp, at the Paris Salon, and at the Academy and New Gallery in London. His works include genre scenes and portraits of Mazzini, Gounod, Browning, Rubinstein, Stanley, and ex-President Cleveland. He wrote: *Felix Mendelssohn's Letters to Ignaz and Charlotte Moscheles* (1888); *In Bohemia with Du Maurier* (1897); and *Fragments of an Autobiography* (1899). He also wrote pamphlets on the subject of international arbitration and peace associations, such as *Patriotism as an Incentive to Warfare*.

MOSCHELES, IGNAZ (1794-1870). An Austrian piano virtuoso and composer, born in Prague, of Jewish parentage. After a course of study at the Prague Conservatory he went to Vienna, where he became a pupil of Albrechtsberger and Salieri. He was a remarkable improvisator, and won his greatest successes as much by that gift as by the more important discovery of the 'singing tone' by which he secured modifications of tone and variations in tone color by means of touch—an art subsequently developed by Liszt and his school. Although he was very successful in his tours of Russia, Holland, Germany, and France, his greatest fame was won in London, in which city he took up his residence in 1821. He did not, however, sever his connection with the Continent, for in 1824 he was giving lessons in Berlin, where he numbered Mendelssohn among his pupils, and formed a friendship with him that was of great mutual profit. He was of much assistance to Mendelssohn when that master first visited England, and was in turn persuaded to join Mendelssohn in the management of the newly formed Leipzig Conservatory (1824). With the exception of five concertos and a collection of studies which are still highly esteemed, his compositions are gradually being forgotten. His works include piano concertos, arrangements, instrumental chamber music, sonatas, and numerous études, about 140 opus numbers altogether. He died in Leipzig. Consult *Aus Moscheles' Leben. Nach Briefen und Tagebüchern herausgegeben* (Leipzig, 1872); English translation by Coleridge.

MOSCHEROSCH, mō'she-rōsh, JOHANN MICHAEL (1601-69). A German satirist of the seventeenth century. He came of an old Spanish family, and was born at Willstett, near Strassburg, and wrote under the name Philander von Sittewald. He studied in Strassburg, and held various diplomatic positions. He was admitted to the Fruchtbringende Gesellschaft in 1645 with the name of 'Dreamer,' and about 1640 published his "Book of Visions," *Wunderliche und wahrhaftige Geschichte*, apparently patterned after Quevedo's *Sueños*. Consult: Nickels, *Moscherosch als Pädagog* (Leipzig, 1883), and Pariser, *Beiträge zu einer Biographie von Moscherosch* (Munich, 1891).

MOSCHI, mōs'ki (Lat., from Gk. Μόχοι, *Moschoi*). An ancient people of Asia, living south of the Caucasus. According to Pliny they dwelt around the sources of the Phasis between the Euxine and Caspian seas. Their name by early writers is often coupled with that of the Tibareni, and the two people are generally identified with the Meshech and Tubal of Scripture. Under the appellation of Muskai they appear in the cuneiform inscriptions as carrying on war against Tiglathpileser, King of Assyria (c.1150 B.C.), who defeated their forces and overthrew their five kings. Consult Rawlinson, *Five Great Monarchies, Assyria* (London, 1867).

MOSCHUS, mōs'kūs (Lat., from Gk. Μόχος, *Moschos*). A Greek bucolic poet of the second century B.C., apparently a native of Southern Italy. Besides some short poems we possess his "Lament for Bion" (Ἐπιδάφιος Βίωτος), his teacher, which is an imitation of Bion's "Lament for Adonis;" also his "Rape of Europa" (Ἐρώπη) and his "Cupid the Runaway" (Ἐρως δραπέτης). His poems were united in antiquity with those of

Theocritus and Bion, and appear with them in modern editions also. He was translated by Lang (London, 1896).

MOSCOSO DE ALVARADO, mōs-kō'sō dā al'vā-rā'bō, LUIS DE (1506-61). A Spanish soldier and explorer in America. He was born in Badajoz, and was a kinsman of Alvarado, whom he followed to Peru. Four years afterwards, with De Soto, he started for Florida, and succeeded him in command in 1542. After terrible privations and with decimated forces he reached Mexico in 1543. There Mendoza received him kindly. In 1551 Moscoso accompanied Mendoza to Peru, where he died.

MOSCOW, mōs'kō (Russ. *Moskva*). A government of Central Russia, bounded by the Government of Tver on the northwest, Vladimir on the northeast, Ryazan on the east, Tula and Kaluga on the south, and Smolensk on the west (Map: Russia, E 3). Area, 12,875 square miles. It occupies a portion of the central plateau of Russia, and slopes eastward toward the Oka. It belongs to the basin of the Volga, and is watered by that river and the Oka on the boundaries, and by the Klyama, Moskva, and other rivers in the interior. Geologically the government belongs to the Moscow coal basin, the carboniferous formation being covered up with various clays, sandstone, and marble. The soil is loamy and not very fertile. About 40 per cent. of the area is clothed in forests, mostly belonging to private persons.

Agriculture is highly developed, and the farm products are of great diversity. Rye, potatoes, and oats are the staples. Gardening is carried on extensively, and vegetables are raised in quantities sufficient to be exported to Saint Petersburg and Kronstadt. Stock-raising is also important.

Moscow is the leading manufacturing government of Russia. In 1896 it had 1755 manufacturing establishments, employing over 207,000 hands. The value of the output of that year was over \$130,000,000. The chief products are textiles (especially cotton and silk), which were manufactured in that year to the value of over \$80,000,000. Other important products are machinery, brick, chemicals, knit goods, etc. An important item in the economic life of the government is the house industry, which has reached here a higher degree of development than in any other part of Russia. It exists all over the province, groups of villages being engaged in the manufacturing of one product. The articles manufactured in this way are of a very wide range, including leather and leather products, hats, pins, brushes, cheap chromos, carriages and wagons, lace, gloves, etc. It is estimated that agriculture furnishes on the average only about 40 per cent. of the income of a peasant family in the government.

The commerce in the products of the house industry is of great extent, and is centred chiefly in the city of Moscow. The government is well supplied with transportation facilities, being traversed by six of the most important railway lines of the Empire. Education is meagrely provided for. The proportion of illiterates is estimated at 80 per cent. Population, in 1897, 2,433,356, chiefly Great Russians. Capital, Moscow.

MOSCOW. The second capital and historically the most famous city of the Russian Empire, capital of the military district and government of the same name, and the second largest city of Russia. It is situated on the river Moskva (a tributary of the Oka) in latitude 55° 45' N., and longitude 37° 37' E., 400 miles southeast of Saint Petersburg, at an altitude of from 500 to 850 feet above the level of the sea (Map: Russia, E 3). It has a rather cold climate, the annual temperature being 39° F., ranging from a mean of 12° in January to 66° in July.

The city is irregularly built. On the northern bank of the river rises the Kremlin, the acropolis of old Moscow, for many centuries the centre of the political and religious life of Russia and still the most venerated place in the heart of every Russian. It was the nucleus of the modern city and contained in the early periods of the history of Moscow the palace of the Czar, the chief churches and monasteries, and the palaces of the nobility. As the city developed, the merchants and the numerous artisans began to settle outside of the walls. Thus grew up the commercial quarter east of the Kremlin, known as the Kitai Gorod (Chinatown), still constituting the commercial centre of Moscow, and numerous small communities independent in their internal administration and composed mostly of members of the same trade. These divisions are still retained to a large extent in the parishes into which the city is divided. They were subsequently grouped together and surrounded by walls, and now form the Byely Gorod (white town), surrounding the Kremlin and the Kitai Gorod, and the Zemlyanoi Gorod (earthen town), inclosing all the above-mentioned quarters as well as Zamoskvoryetchye on the southern bank of the river. There is also a fourth inclosure (Kramer-Kollez, earthen wall) surrounding the outer parts of the city and forming the limits of Moscow proper. Only the walls of the Kremlin and of the Kitai Gorod have been preserved, all others having been converted into boulevards and avenues. See **KREMLIN** for illustration.

Although one of the oldest cities of Russia, Moscow has preserved comparatively few architectural monuments outside of its churches and monasteries, most of the old buildings having perished in the destructive conflagrations which figure so prominently in the history of the city. With the introduction of Western civilization into Russia by Peter the Great and his successors, the Russian style of architecture gradually disappeared in connection with the secular and private buildings, and the application of Western standards not infrequently produced very peculiar results. Under Alexander II. a revival of Russian architecture was inaugurated and a number of successful restorations have been accomplished. The chief interest of Moscow, as already stated, is centred in the Kremlin, both for its historical associations and for its churches and monasteries with their semi-barbaric splendor and curious architecture. The Kremlin is nearly triangular in shape and surrounded by a wall about a mile and a half long. The wall is surmounted by 18 towers and pierced by 5 gates, among which is the Spasskiya Vorota (Gate of the Saviour)—one of the most revered historical places of Russia, and associated with many of the chief events of national history. Within the walls of the Kremlin, the most famous edifice is the Uspenski

Sobor (Cathedral of the Assumption), in which all the Russian monarchs since Ivan IV. have been crowned. The present building was erected by Aristotele Fioraventi in the fifteenth century on the site of an older church founded in 1326. It is Lombardo-Byzantine in style, with Indian cupolas. The semi-dark interior is adorned with numerous icons, covered with gems and precious metals. They are of great antiquity, one of them being attributed to Saint Luke. The treasury of the cathedral, one of the richest in Russia, contains many valuable Bibles, manuscripts, and sacred vessels, as well as numerous relics of saints. The Cathedral of Saint Michael the Archangel is the former burial place of the Russian monarchs. It dates in its present form from the beginning of the sixteenth century and is surmounted by five domes, the central one being of gilt. The interior is richly decorated and its walls are covered with the portraits of the Russian monarchs interred there. In the partly Gothic Cathedral of the Ascension, founded in 1397, the walls and the thick pillars are covered with portraits of saints and Greek philosophers, and the floor is made of semi-precious stones of various colors.

One of the sights of the Kremlin is the tower of Ivan the Great, 322 feet high and crowned by a gilt dome; it contains 34 bells, weighing altogether about 580,000 pounds. In former times the Kremlin contained numerous monasteries and convents, of which only a few have been retained. The most interesting of these are the Maiden Convent, for centuries the burial place of the Russian princesses, and the Tchudov Monastery, an institution of great historical importance and a great factor in the development of ecclesiastical learning in Russia. Near the Tower of Ivan the Great stand two objects very famous in Russia. One is the Czar Bell, cast in 1735, and now resting on a stone pedestal. Part of the bell, broken off during the fire of 1737, lies near by. It is over 60 feet in circumference around the rim, 19 feet high, and weighs nearly 199 tons. The other, near the Museum of Arms, is the Czar Cannon, cast in 1586, and weighing nearly 40 tons. The palaces of the Kremlin are mostly modern, and only a few portions of the old abode of the Russian monarchs have survived. The great palace, finished in 1849, is a vast building of white stone with a gilt cupola, and possessing numerous magnificent halls devoted to the different orders of Russia. Attached to it are the living rooms of the old Russian rulers, known as the Terem, and dating from the seventeenth century. They are of great architectural value and well preserved. Connected with the palace are the old banquet hall known as Granovitaya Palata, with its red stoop, from which Russian monarchs used to address the populace; and the Oruzhejnaya Palata (hall of arms), containing immense treasures in the form of crowns, sceptres, thrones, costumes, banners, armor, gold and silver plate, carriages, etc. The palace of the patriarch, built by Nikon in 1655, has one of the most valuable libraries in Russia, and a treasury of fabulous wealth. The arsenal of the Kremlin is one of the largest in the world.

The Kitai Gorod, adjoining the Kremlin, also has many historical associations. Especially noteworthy is the Red Square, used repeatedly as a camp by the besieging Mongols, as a forum by the Russian monarchs, and as a place of

MOSCOW

1. CATHEDRAL OF VASILY THE BEATIFIED
2. CHURCH OF THE SAVIOUR

execution. Facing the Red Square is the Cathedral of Vasilii the Beatiſied, which for mixture of styles, colors, and architectural lines has few rivals in the civilized world. It was built by an Italian architect at the command of Ivan the Terrible in 1554 to commemorate the conquest of Kazan, and consists of a number of separate buildings under separate cupolas, differing from each other in form, dimension, and glaring colorings. The interior does not differ essentially from that of the other great churches of Moscow, being dark, close, and covered with paintings, gold, and gems in great profusion. Contrasting favorably with the Cathedral of Vasilii the Beatiſied is the modern Church of the Saviour, consecrated in 1881 in commemoration of the destruction of Napoleon's Grand Army in 1812. It is Lombardo-Byzantine in style, cruciform, and well proportioned, built of white marble and surmounted with five cupolas. The paintings and the marble reliefs of the interior have been executed by the best artists of Russia.

In the centre of the Red Square stands the monument to Minin and Pozharski, who liberated Moscow from the Poles in 1612. The Greek Monastery of Saint Nicholas in the Kitai Gorod deserves mention for its influence on education in Russia. It was under the auspices of the monks of Saint Nicholas that the first academy for classical education was established in the seventeenth century. It numbered, among its pupils, Lomonosoff and many others prominent in the literary and the political life of the country. The Kitai Gorod possesses a number of old residences of the boyars (q.v.), of which the most interesting is the family house of the Romanoffs, faithfully restored in 1859. The Gostinoy Dvor, the centre of the retail trade of Moscow, is also very interesting architecturally. Other noteworthy secular buildings and monuments are the Petrovski Palace, occupied by Napoleon during his stay at Moscow, the town hall (duma), the Sukhareff Tower (1692-95) with the reservoir, the triumphal arch, etc. Moscow has extensive markets, of which probably the most interesting is the Tolkutchy, where old clothes are sold to the poorer classes. In the most northern quarter of the Zemlyanoi Gorod are still found many stately although somewhat decayed mansions of the old nobility, while Zamoskvoryetshy, on the opposite side of the river, is the stronghold of the wealthy merchant class.

Economically, Moscow is exceedingly important, both with regard to industries and commerce. The manufacturing industries date from the time when the city was the residence of the Court and attracted skilled artisans from all over Russia as well as from foreign countries. At present Moscow is the second largest manufacturing city of the Empire and the centre of the textile industries, furnishing a considerable portion of the cotton goods for the Asiatic trade. According to the industrial census of 1895 there were more than 800 large manufacturing establishments, employing over 65,000 persons and yielding an output of over \$67,000,000, of which textiles represented over one-third. Next to textiles are foodstuffs, metal products, paper, leather and wood products, and machinery. As early as the fourteenth century Moscow was an important commercial centre. Its trade grew up with the political power of the Principality of Moscow, and received a great stimulus from

the settlement of the Novgorod merchants. The advantageous position of the city at the converging of six railway lines, which connect it with every part of European Russia as well as with Siberia, has played an important part in its recent commercial development. Manufactures, agricultural products from the southern and the central provinces of Russia, minerals from the coast, and tea from Asia, all find their way to Moscow and go partly to supply the local demand and partly to supply the trade with the interior or with foreign countries. The rise of Saint Petersburg had at first a detrimental effect on the foreign trade of Moscow, but the development of the Asiatic trade, of which Moscow is the natural centre, has more than compensated for the loss in any other direction. The trade by water is important. The chief imports of Moscow are tea, iron and steel products, raw silk, indigo, cotton yarn, etc.

Moscow is administered by a Governor-General, who is also at the head of the military district of Moscow. The municipal council of 160 members is elected by owners of real estate and merchants of the first class, and has an executive committee of six members. Both the municipal council and the executive committee are presided over by the mayor or 'golova,' who, unlike the mayors of all other Russian towns except Saint Petersburg, is appointed by the Government from two candidates suggested by the council.

The budget of the city for 1901 balanced at \$7,000,000. The chief items of revenue are real estate and internal taxes, subvention from the Imperial Government, the zemstvo, and returns from municipal property and enterprises. Nearly one-fourth of the revenue is spent on sanitation, about 12 per cent. on municipal improvements, and less than 8 per cent. on education. The municipality owns the waterworks, slaughter-houses, and baths, and a number of lodging-houses. In regard to facilities for local transportation Moscow is far behind most European cities of its size and importance. Moscow has many prominent educational establishments. Besides the university (see Moscow, UNIVERSITY OF) there are a theological seminary, a technical school, an agricultural institute, an institute for the study of Oriental languages, schools of art, painting, and architecture, a school of engineering, two seminaries for teachers, a number of dramatic schools, a commercial institute, 21 gymnasia, 5 *Realschulen*, a school of church music, and numerous other special schools. Libraries are numerous. The most important museums and collections are the Rumyantzeff Museum, consisting of a fine library and collections of paintings, sculptures, ethnography, etc.; the historical museum, and the Tretyakoff Gallery of modern paintings, now belonging to the city. A number of prominent scientific organizations have their home at Moscow, including the society of naturalists and the society of Russian history and antiquities. The numerous archives of Moscow are also noteworthy. The benevolent institutions are among the largest in Russia, especially the foundling asylum. The theatres of Moscow, especially the 'small theatre,' have played a prominent part in the development of the Russian drama. The periodical publications of Moscow are numerous, and the book trade of the city, especially popular publications, is very extensive.

The population was 753,469 in 1882, and 977,269 in 1897. A very large percentage is made up of persons born outside of Moscow. The predominance of males is very marked (about 131 to 100 in 1897). About 60 per cent. of the population belong to the peasantry. The Greek Orthodox inhabitants constitute 94 per cent. of the total population of Moscow, as compared with 84 per cent. in Saint Petersburg. The environs of the city are replete with historical interest, and contain many estates of the old nobility and royal favorites, among which may be mentioned the Petrovsko-Razymovskoe, with its extensive park and academy of agriculture. There are also many large parks and groves, where the masses amuse themselves on holidays.

HISTORY. The site of the city was probably inhabited long before the twelfth century, but the first mention of Moscow dates from 1147, when it was the estate of the Suzdal Prince Yuri Dolgoruki. The city began to rise with the Principality of Moscow under Daniel, the son of Alexander Nevski, in the thirteenth century, and especially under Ivan Kalita (1328-40), who with the aid of the Mongols succeeded in annexing many of the minor principalities to Moscow, and greatly embellished the capital. About this time the Metropolitan Peter transferred his seat to Moscow, thereby laying the foundation of its future position as the religious capital of Russia. With the union of the Russian principalities under Ivan III. (1462-1505) Moscow became the capital of Russia and began to assume the proportions and appearance of a large city. It was surrounded by stone walls, and architects from foreign countries were summoned to build its churches and palaces. But the growth of the city was not infrequently interrupted by the invasions of the Tatars, repeated conflagrations, and pests. It also suffered from the internal dissensions and revolts during the seventeenth century, notably the Polish occupation in 1610-12, the revolt of the people against the corrupt favorites of the Czar, the riots following the introduction of religious reforms by Nikon, and the rise of the *Streltsi* (q.v.) against the reforms of Peter the Great. Peter found Moscow, the bulwark of Russian orthodoxy, extremely unfavorable for the introduction of his reforms, and transferred the Court to Saint Petersburg. In the eighteenth century the city was visited by a number of disastrous conflagrations and the plague of 1771. On September 14, 1812, Moscow, almost entirely deserted and with its treasures and archives removed to Vladimir, was occupied by the army of Napoleon, seven days after his disastrous victory at Borodino (q.v.). On the following day the Emperor made his entry into the city. On the night of the 15th to the 16th, in accordance with a prearranged plan, fires were started in several parts of the city, and soon the entire place was in flames, so that, on September 16th, Napoleon was compelled to remove his headquarters from the Kremlin. The churches and palaces were meanwhile abandoned to the depredations of the invaders and the criminal classes, the jails having been thrown open by the order of the Governor. On October 19th the French began their fatal retreat from the city. On May 18, 1896, Moscow was the scene of a fearful disaster, brought about by the distribution of gifts at a popular festival arranged in honor of the coro-

nation of Nicholas II. Over 2000 people were crushed to death and many more wounded. Consult: Fabricius, *Le Kremlin de Moscou* (Moscow, 1883); Zabel, *Moskau* (Leipzig, 1902); Sabjelin, *History of Moscow* (in Russian, Moscow, 1902).

MOSCOW. A town and the county-seat of Latah County, Idaho, 94 miles south-southeast of Spokane; Wash., on the Northern Pacific and the Union Pacific railroads (Map: Idaho, A 2). It is the seat of the University of Idaho (q.v.) with the State Agricultural College. Mining, farming, fruit-growing, stock-raising, and lumbering are the leading industries, and there are some manufactures. Population, in 1900, 2484.

MOSCOW, UNIVERSITY OF. The oldest and largest institution of higher learning in Russia, organized in 1755. At its inception it consisted of three faculties—law, medicine, and philosophy—with a total staff of ten professors, mostly brought from Western Europe. The curriculum was very limited in its scope until 1807, when it was reorganized by Alexander I. At the burning of Moscow in 1812 the university buildings were destroyed. The most valuable collections, however, had been previously removed. Instruction, suspended for a while, was resumed in 1813, and new buildings were erected in 1816-19. In 1835 the number of chairs was increased to thirty-five and a uniform four years' course established for all departments. In 1841 the Medico-Surgical Academy was united with the University. The liberal University Act of 1863 gave the professors and students a certain amount of self-government which was abolished during the reactionary régime of Alexander III. in 1884. In 1902 Moscow University consisted of the following faculties: (1) Medicine, (2) law, (3) physical and natural sciences, (4) historico-philological faculties. It offers four-year courses leading to the degree of Candidate. In the medical school, however, the course covers five years, the regular degree being 'physician'; the degrees of Master, Doctor of the various sciences, and M.D. are conferred for special investigation. The university library contains 271,926 volumes and 23,239 pamphlets. The departmental libraries, laboratories, observatory, museums, etc., number altogether 33. The medical department has 14 special clinics and hospitals. The teaching staff consists of 27 emeritus, 44 ordinary, and 20 extraordinary professors, 175 privat-docents, and 11 instructors. The number of students in 1902 was 4691, of whom 363 took the historico-philological, 321 the mathematical, 683 the natural science, 1673 the law, and 1100 the medical course. The expenditures of the university amount to about \$830,000. As the majority of the students come from the poorer classes, the number of scholarships is very large, the number in 1902 reaching as high as 645. The university is under direct supervision of the Minister of Public Instruction, who appoints the rector. There is a university council, but its powers are very limited.

MOSEILIMA, mò-sí'lè-má (Ar. *Musailimah*, from the proper name *Muslimah*, from *salima*, to be safe). One of the most important of the rival prophets who came forward in Arabia when Mohammed had stirred the religious thought of the people. He belonged to the tribe of the Beni Henifah, of Yamama in Nejd. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably

certain that he had risen to a certain eminence in his tribe, probably as a religious teacher only at first, before Mohammed assumed his prophetic office. He seems to have proposed to divide the religious leadership with Mohammed, a suggestion which the latter contemptuously refused. He never undertook to supplant Mohammed. After the death of the Prophet, Moselima set up the standard of open opposition and was defeated and killed in a desperate battle by Khalid, who had been sent against him by Abu Bekr. His 'heresy' was stamped out, and only a few scattered supporters contrived to escape to El-Hasa and Basra, where they may have laid the foundation of the later Karmathian creed. See MOHAMMEDAN SECTS.

MOSELEY, mōz'li, HENRY (1801-72). An English mathematician, born at Newcastle-under-Lyme. He graduated at Saint John's College, Cambridge, and in 1831 became professor of natural philosophy and astronomy in King's College, London. In 1853 he was appointed canon of Bristol Cathedral, and two years afterwards was made chaplain to the Queen. He published a number of scientific books, *Mechanical Principles of Engineering and Architecture* (1843) being the most important. Moseley discovered formulae for the dynamical stability of warships, which have come into common use.

MOSELLE, mō-zēl', German MOSEL, mō'zel. One of the principal affluents of the Rhine. It rises on the west slope of the Vosges Mountains in the northeastern corner of France, flows north-westward to the French boundary, then northward past Metz and Thionville, after which it turns to the northeast, and with many windings through the Prussian Rhine Province, enters the Rhine at Coblenz (Map: Germany, B 3). Throughout the greater part of its length the Moselle runs through a narrow valley occupied by fertile fields and meadows, and inclosed by steep hills and mountains, in many places becoming rocky cliffs. In the lower valley the hills are vine-clad, producing the celebrated Moselle wines, noted for their delicate aromatic flavor. Numerous ruins and historic landmarks also make the valley notable. The total length of the river is 314 miles; it is navigable 214 miles for small vessels. Two lines of steamers ply regularly between Coblenz and Treves.

MOSEN, mō'zen, JULIUS (1803-67). A German author, born at Marieney in the Vogtland, Saxony. He attended the University of Jena, where Goethe awarded him the first prize for his competitive anniversary poem on Karl August's fiftieth birthday; completed his studies at Leipzig in 1826-28, and from 1828 to 1831 was in the office of an advocate at Markneukirchen. He went to Oldenburg in 1844 under appointment from Grand Duke Paul Frederick August as dramaturgist of the Hoftheater with title of Councilor. His activity in that post was interrupted by illness, and from 1850 he was pensioned. His first public success was achieved by the epic *Lied vom Ritter Wahn* (1831), based on the Italian legend of *il cavaliere Senso*, and his reputation was much increased by *Ahasver* (1838), a second poem in that kind, whose large, historical action is somewhat impeded by its philosophy. The *Gedichte* of 1836 (2d ed. 1843) include the well-known ballads, long since established as *Volkslieder*, "Andreas Hofer," "Der

Trompeter an der Katzbach," and "Die letzten Zehn vom vierten Regiment," descriptive of an episode in the Polish contest for independence. Of his works of fiction, the best, perhaps, are the *Bilder im Moose* (2 vols., 1846), short stories, finished in workmanship. His dramas were over-weighted with the rhetorical exposition of his ideas on politics and history. *Otto III.* (appeared with three others as *Theater*, 1842) was the most important. As dramaturgist, he did much to further German drama, especially Shakespearean presentations. The best collective edition of his works is that of 1880 (Leipzig, 6 vols.). Consult the anonymous biography, *Julius Mosen* (Oldenburg, 1878).

MOSENTHAL, mō'zen-täl, JOSEPH (1834-96). A German-American musician, born at Cassel. He studied under his father and Spohr, and in 1853 came to America, where he played the organ in Calvary Church, New York City, from 1860 to 1887. He was conductor of the Mendelssohn Glee Club in New York City from 1867 to 1896, played a first violin in the Philharmonic Orchestra for forty years, a second violin in the Mason and Thomas Quartet for twelve, and composed much Church music, such as the psalm "The Earth is the Lord's," and part songs for male voices, *Thanatopsis*, *Blest Pair of Sirens*, and *Music of the Sea*.

MOSENTHAL, SALOMON HERMANN VON (1821-77). A German dramatist. He was born at Cassel, studied at Marburg, and in 1850 became an official in the Ministry of Public Instruction at Vienna, and was soon afterwards appointed Ministerial archivist. His investiture with the Order of the Iron Crown in 1871 conferred knighthood upon him. He is chiefly known by the dramas *Deborah* (1850; numerous later edd. known in English as *Leah the Forsaken*), and *Der Sonnenwendhof* (1856), which have been represented with success, and translated into several languages. He also wrote the libretti for a number of well-known operas, notably Nicolai's *Die lustigen Weiber von Windsor* (1849) and Goldmark's *Die Königin von Saba* (1875). His collected works were published in six volumes in 1877-78.

MÖSER, mōz'ēr, ALBERT (1835-1900). A German lyric poet. He was born at Göttingen, and after studying there became a teacher in Dresden. His odes, sonnets, and songs attained great popularity, especially a ballad, 'Die Rose von Mars la Tour,' and are marked by much melody, by a dreamy reflective manner, and occasionally by great skill in the reproduction of classical metres. His *Gedichte* were published in 1865.

MOSER, mōz'ēr, GEORGE MICHAEL (1704-83). An English gold-worker and enameler, born at Schaffhausen in Switzerland. At an early age he went to London, where he was a friend of Sir Joshua Reynolds, of Goldsmith, and of Dr. Johnson; was drawing teacher to George III., and was one of the founders and the first keeper of the Royal Academy. Moser was especially famous as an enameler of jewelry.

MOSER, GUSTAV VON (1825-1903). A popular German dramatist, born at Spandau, May 11, 1825. He was trained for the army, entered it in 1843, and served till 1856, when he married the daughter of a wealthy landed proprietor. After an unfortunate venture in comedy, *Der weibliche Hussar*, he devoted himself to agriculture till a happy meeting with the Berlin stage-director

Wallner brought him back to the stage in 1861 for a career of almost unbroken popular success. Of more than forty comedies the most noteworthy are: *Das Stiftungsfest* (1873); *Ultimo* (1873); *Der Veilchenfresser* (1876); *Der Bibliothekar* (1878); *Krieg im Frieden* (1880). He also wrote a number of plays in collaboration with others. A uniform edition of Moser's works was begun in 1873, and extends to more than twenty volumes.

MOSER, JOHANN JAKOB (1701-85). A German publicist, born in Stuttgart. He studied at the University of Tübingen, where in 1720 he became professor of law. In consequence of some difficulties with the censor, he resigned this position in 1732, and in 1736 answered a call to the University of Frankfurt-on-the-Oder. Here he incurred the displeasure of Frederick William I., and in 1739 was again compelled to resign. In 1747 he became Privy Councilor and chief of the chancery in the service of the Landgrave of Hesse-Homburg, but two years later he went to Hanau and in 1751 returned to his native city, where he entered the service of the Duke of Württemberg. In 1759, being held responsible for certain manifestoes directed against the Duke, he was imprisoned in the fortress of Hohentwiel, where he remained for five years. After his release his offices were restored to him. Among his works are: *Deutsches Staatsrecht* (1766-75, 21 vols., besides two supplementary vols., and an index); *Neues deutsches Staatsrecht* (1766-75, 21 vols. and additions, 1781-82, 3 vols.); *Deutsches Staatsarchiv* (13 vols., 1751-57); and his *Lebensgeschichte* (3d ed., 4 vols., 1777-83). Consult Wächter, *J. J. Moser* (Stuttgart, 1885).

MÖSER, mēzēr, Justus (1720-94). A German historian and publicist, born at Osnabrück. He studied law at Jena and Göttingen, and in 1747 was chosen *advocatus patriæ*. He was sent to England in 1763 on financial business of the Allies. During the minority of the Duke Frederick of York, who became afterwards Bishop of Osnabrück, Möser was the principal adviser of the Regent. He founded in 1766, the weekly *Die Osnabrückischen Intelligenzblätter*, from which he reprinted in 1774 *Patriotische Phantasien*, a series of brilliant and valuable essays. His *Osnabrückische Geschichte* (1768; 3d ed. 1819) is an anticipation of the best results of the modern German historical methods. His collected works, edited by Abeken (Berlin, 1842-44), include a biography by Nicolai and Möser's poetry. Consult: Kreyszig, *Justus Möser* (Berlin, 1857); and Rupprecht, *J. Möser soziale und volkswirtschaftliche Anschauungen* (Stuttgart, 1892).

MOSES, mō'zēs. The most prominent figure in the earlier portion of the Old Testament narrative. According to the modern view which regards the Pentateuch as a combination of different sources, those portions relating the career of Moses (in the main, the books of Exodus and Numbers) combine three distinct documents or strata of tradition. It is still possible in most cases to separate the historical compilation known as JE (see ELOHIST AND YAHWIST) into its two component parts. In addition to these is the so-called Priestly narrative (see HEXATEUCH), which is considerably later than either J or E. A brief summary of the career of Moses as given by each of these sources will

make clear wherein they differ, and also indicate their value as historical material.

In the narrative of the Yahwist, Moses first appears as a fugitive in Midian. A story is told of his helping the daughters of a priest of Midian to water their sheep, the tale reminding of a similar incident in Jacob's life (Gen. xxix. 1-10); and just as Jacob married Rachel, so Moses marries Zipporah, a daughter of the priest. After the death of the king from whom he had fled, and of those who had sought his life, Moses returns to Egypt. On the way Yahweh appears to him in a burning bush and gives him the command to deliver his people, the Hebrews, from the oppression in Egypt, and bring them to Canaan. Moses hesitates, but is reassured by three signs given him. He delivers his message to the elders of Israel, and Pharaoh is requested to let the Israelites go into the wilderness to perform a sacrifice. Upon the refusal of Pharaoh, seven plagues (see PLAGUES OF EGYPT) are sent in succession. Pharaoh proposes a compromise, which Moses refuses, and at last, when the first-born in every Egyptian family is stricken with death, the Egyptians in a panic hurry the Israelites out of Egypt. Pharaoh recovers from his terror and starts in pursuit of the fugitives, who are guided by a cloud at day and by a pillar of fire at night; but the King and his army are drowned in the sea after the Israelites have crossed in safety. The people are led into the wilderness and endure hardships until they reach Mount Sinai, where Yahweh appears and calls Moses to Him on the Mount. He remains there forty days and forty nights, and receives from Yahweh two tables of stone. Moses' father-in-law, Hophni, the son of Reuel, the Midianite, visits him and decides to accompany the Israelites. They continue their wanderings amid many hardships till they reach Kadesh. Caleb and others are sent into Canaan as far as Hebron and bring back reports about the fertility of the land and the powerful character of the inhabitants. Israel marches along the borders of Edom to Moab, conquering Heshbon and other Amorite cities. Balaam is sent for by Balak, the King of Moab, to curse Israel, but fails to do so; final laws and exhortations are delivered by Moses to his people. He is then called to the top of Pisgah, where, after being shown all of Canaan, he dies, being buried by Yahweh Himself in a valley of Moab opposite Beth-peor. Aaron in this narrative is completely ignored.

In the Elohist narrative, the birth of Moses in Egypt is related with the story of his miraculous deliverance from the decree of Pharaoh. His sister (Miriam) was by him when he was found in an ark of bulrushes by Pharaoh's daughter. He is educated as an Egyptian noble, but learning that he is an Israelite, goes out to see how his people fare, and observing an Egyptian ill-treating an Israelite, he slays the former. and when the deed becomes known, flees to Midian. While tending the flocks of his father-in-law, Jethro, on Horeb, 'the mountain of God' [Elohim], God reveals Himself and announces His new name, Yahweh. Moses is ordered by Yahweh, who has heard the cry of the oppressed people, to go to Pharaoh and demand the release of the Israelites. On his way to Egypt, he is joined by Aaron. Together they appear before Pharaoh. Five plagues are brought upon Egypt, and when

the last—the death of the first-born—is sent, Pharaoh gives Moses and Aaron permission to depart with the Israelites. "The latter, loaded with presents from the Egyptians, and carrying with them the bones of Joseph, start on their journey. Pharaoh follows in pursuit with 600 chariots, but Moses lifts up his rod. An angel places himself between Israel and the pursuers and the latter perish. The people, fed by bread from heaven, reach Horeb, where Yahweh appears amid thunder and lightning, and delivers to the people the Ten Commandments. (See DECALOGUE.) Moses and Joshua ascend the Mount and during their absence Aaron makes a golden calf for the people. Upon the return of Moses and Joshua, they see the people dancing around the calf, and in anger Moses breaks the two tables. Moses returns to Yahweh, intercedes on behalf of his people, and receives laws which he communicates to the people. Jethro visits Moses and suggests the appointment of subordinates to assist in the government of the people. Miriam and Aaron revolt against Moses and are punished; Amalek attacks Israel and is completely routed; Dathan and Abiram rebel against Moses and are swallowed up by the earth. The people reach Kadesh, where Miriam dies. Moses urges Israel to invade Canaan, and 12 men are sent out to survey it, who bring back discouraging reports so that the people ask Moses for a leader to take them back to Egypt. Because of the complaints of the people at their hardships, fiery serpents are sent as a plague; Moses makes a brazen serpent by looking at which the sufferers are healed. Yahweh announces to Moses that he is about to die, and Joshua is appointed as his successor. Moses delivers final laws and exhortations and dies in the land of Moab. His burial place is unknown.

The Priestly narrative brings Aaron into constant association with Moses, but ignores Miriam. God speaks to Moses and Aaron in Egypt; the former is at the time eighty years old—the latter eighty-three. Six plagues are wrought in a miraculous way by Moses and Aaron in the presence of Pharaoh and his magicians, who at first are able to perform the same miracles. The Israelites leave Egypt to observe the Passover festival. They are pursued by Pharaoh, and Moses stretches out his hand over the sea, the waters of which are divided and afford a passage for Israel. After the Israelites reach the farther shore, Moses again stretches out his hand, the waters return and the Egyptians are drowned. After long wanderings, the people come to Sinai, where Yahweh appears. Moses ascends into the cloud that hovers over the mountain and receives instruction from Yahweh regarding the tabernacle and its furniture, and the duties of the priests and their vestments. He also obtains two tablets of stone. Moses and Aaron proceed to organize the nation and its worship. A census is taken, and the people leave the wilderness. Korah and 250 princes rebel against Moses and Aaron and a sign is given by Yahweh—the blossoming of Aaron's rod—proving the choice of Aaron and his family for the priesthood. Joshua, Caleb, and ten others are sent to survey Canaan. The ten bring back discouraging reports against which Joshua and Caleb protest. Yahweh appears and announces that Joshua and Caleb alone of the grown men shall enter Canaan; the ten

are stricken with death. A second census is taken by Moses and Eleazar. Joshua is appointed the successor of Moses, who, after delivering final laws, ascends Mount Nebo, and dies at the age of one hundred and twenty years in the full possession of all his faculties.

The Book of Deuteronomy, taken up with the final addresses and ordinances given by Moses, adds nothing to the above traditions of his career.

A general survey of these narratives reveals certain features in the career of Moses that must have become permanently fixed in the minds of the people, before the attempt was made to adjust the figure to the pragmatic theory which guides the Old Testament writers in their survey of the past. These are: (1) his presence in Egypt; (2) his association with Midian and the cult at Horeb or Sinai (q.v.); (3) his leadership of certain clans. The popular reminiscences of a sojourn of the Hebrews in Egypt point to the presence at one time in that land of some of the clans that afterwards formed part of the Hebrew confederation. (See JEWS.) These clans subsequently left Egypt and returned to the wilderness, whence they originally issued. Joining other clans at Horeb (or Sinai), they adopted a cult which existed there. The mountain was a sacred one and the deity who dwelt on the top was known as Yahweh. The relationship of Moses to these incidents depends upon the question whether he is to be regarded as an individual or as the representative of a clan. It must be confessed that at times Moses is spoken of as though he were merely the eponymous ancestor of a clan, and yet, taking all things into consideration, the balance of evidence is in favor of the assumption that there was an individual by the name of Moses, of whom some faint reminiscences survived, and who gradually became the favorite personage to whom all traditions, legends, and myths associated with the exodus from Egypt and the birth of the nation—traditions, legends, and myths coming to the Hebrews from various sources and at various times—were attached. The result of this process lies before us in the majestic figure of Moses as portrayed in the union of the three 'strata,' already outlined.

BIBLIOGRAPHY. Consult the histories of Renan, Stade, Guthe, Kittel, Wellhausen, Winckler, Piepenbring, etc.; also the commentaries on Exodus and Numbers enumerated in the articles upon these books; Kuenen, *Religion of Israel*, vol. i. (Eng. trans. Edinburgh, 1874-75); Budde, *Religion of Israel to the Exile* (New York, 1899); Driver in *Authority and Archaeology*, pp. 54-79 (London, 1899). For the mass of additional legends that gathered around Moses, see Beer, "Das Leben Moses nach Auffassung der jüdischen Sage," in *Jahrbuch für die Geschichte der Juden und des Judenthums*, vol. iii. (Leipzig, 1863); Weil, *Biblische Legenden der Muselmänner* (Frankfort, 1845; Eng. trans. under the title *The Bible, the Koran, and the Talmud*, London, 1846).

MOSES. A colossal statue in the Church of San Pietro in Vincoli, Rome, one of the most famous works of Michelangelo. The gigantic figure is seated in the attitude of one about to spring to his feet. The left hand is pressed to the body to restrain his indignation at the worship of the golden calf, at which he appears to

gaze with flashing eyes and frowning face, while the right hand grasps the tables of the law. The head shows two short horns, based on a mistaken interpretation of Ezekiel xxxiv. 21. The "Moses" was one of thirty proposed statues for the tomb of Pope Julius II. in Saint Peter's, which was not completed. See Plate under MICHELANGELO.

MOSES, ASSUMPTION OF, and REVELATION OF. See APOCRYPHA, section on *Old Testament*; also ASSUMPTION OF MOSES.

MOSES, BERNARD (1846—). An American professor of history and political economy, born at Burlington, Conn. He graduated at the University of Michigan in 1870, studied at Heidelberg, and became professor of history in Albion College, N. Y., in 1875. In 1876 he was appointed to the University of California. His first book, *Politics* (1884), was written in collaboration with W. W. Crane; afterwards he produced: *The Federal Government of Switzerland* (1889); *Democracy and Social Growth in America* (1892); and *The Establishment of Spanish Rule in America* (1898). He was one of the Philippine Commissioners appointed by President McKinley.

MOSES OF CHORENE, kô-rê'nâ. An Armenian author, belonging to the fifth century. The only extant works now generally admitted to be his are a *Rhetoric*, and a *History of Armenia*, which appeared in a German version by Lauer at Regensburg in 1869, and entitles him to the foremost place among Armenian historians. A work on geography once ascribed to him is now assigned to the seventh century. Consult Von Gutachmid, *Ueber die Glaubwürdigkeit der armenischen Geschichte des Moses von Khoren* (Leipzig, 1876).

MOSGU, mōs'kōō, or MASA, mǎ'sá. Pagan negroes in the Chad Basin, Sudan, south of the lake, divided into many tribes or branches, and numbering about a million. Less than a third of them have come under the sway of Mohammedanism.

MOSHEIM, mōs'hīm, JOHANN LORENZ VON (1694-1755). A distinguished German Church historian and theologian. He was born at Lübeck, October 9, 1694, and studied at Kiel. In 1723 he became ordinary professor of theology at Helmstedt and in 1747 at Göttingen, where he died as chancellor of the university, September 9, 1755. His theological works are numerous, among them a work on Bible morality, *Sittenlehre der heiligen Schrift* (1735-53; 4th ed. 1753-61, continued by J. P. Miller, 1770-78), and discourses, *Heilige Reden* (1732; 4th ed. 1765). But his contributions to theological literature in the department of ecclesiastical history are most important, by reason of their great learning, fullness, and accuracy. The following have been translated from the original Latin: *Commentaries on the Affairs of Christians Before the Time of Constantine the Great* (London, 1813-15); *Institutes of Ecclesiastical History* (Murdock's trans., ed. by W. Stubbs, 1863; new ed., Boston, 1892); his valuable *Versuch einer unparteiischen Ketzergeschichte* (1746-48) is untranslated.

MOSKVA, mōs-kvǎ. A river of European Russia, a left affluent of the Oka, which is itself an affluent of the Volga. It rises in the Government of Smolensk, flows eastward through the city of Moscow, and joins the Oka near Kolomna, in the Government of Moscow, after a course of

285 miles (Map: Russia, E 3). It is navigable between Moscow and the Oka, a distance of 112 miles, and is an important commercial route. On its banks, September 7, 1812, occurred the famous battle of the Moskva or Borodino between the Russians and Napoleon.

MOSLEM, mōz'lēm, or MUSLIM, mūz'lim. A common designation in the West for a Mohammedan. It comes from the Arabic *muslim*, a derivative of *salima*, 'to be safe,' which is often used by Mohammed in the sense of a 'true believer,' generally in contrast to *kāfir*, an unbeliever, infidel. The name Mussulman, often used in the same sense, is derived from the Persian plural of *muslim* (*muslimān*). See MOHAMMEDANISM.

MOSLER, mōz'lēr, HENRY (1841—). An American genre painter, born in New York City. He studied in Cincinnati under J. H. Beard. During the Civil War he was on the staff of *Harper's Weekly*, and afterwards went to Paris. There he studied under Hébert. Still later he received some instruction at the Munich Academy under Piloty, and in Düsseldorf. He became especially well known in Paris, where he lived many years and exhibited much. He was elected a National Academician in 1895, and in the following year won the Clark Prize. He also won a gold medal at the Salon of 1888, a silver medal at the Paris Exposition of 1889, and a medal and diploma of honor at the Atlanta Exposition in 1895. In 1892 he was awarded the cross of the Legion of Honor. His more notable works include: "Le retour" (1879), which was bought by the French Government for the Luxembourg; "The Purchase of the Wedding Gown" (1880); "The Last Sacrament" (1885); and "The Coming Storm" (1885). His "Wedding Morning" was bought by the Sydney Museum, Australia.

MOSQUE (Fr. *mosquée*, from Sp. *mezquita*, from Ar. *masjid*, temple, from *sajada*, to prostrate one's self, to pray). A Mohammedan house of prayer and worship. Examples of these buildings are found wherever the Mohammedan faith has prevailed, from Spain to India and Turkistan. There is no fixed form of structure for them; in poor communities a bare room provided with a *mihrab* to mark the *kiblah* (q.v.) often serves the purpose. In general the earliest type of mosque was an open court, surrounded on all sides by an arcaded portico, like the atrium or cloister of a church or the peristyle court of an Egyptian temple, but sometimes differing from them in having not a single row, but two or more rows of columns or piers. The side of the court toward Mecca is usually deeper than the other three, with more rows of supports; it contains the *mihrab* and to the right of it the *mimbar* (pulpit), and, in front, generally a platform and reading desk. In the open court (*ṣaḥn*) is the fountain for ablutions, often of large size and covered with a dome.

The mosques of India and Central Asia are generally constructed after this plan. The Mohammedans, however, have always been influenced by the native forms of architecture in the different countries which they have entered. The Spanish mosques, for example, closely resembled churches, having many parallel aisles supported on a forest like the old Cordova mosque, or fewer aisles, like the mosque at Toledo, now San

Cristo de la Luz. The dome was not used to any extent till the fourteenth century, when two new types made it their central form: the mausoleum mosque originating in Cairo, and the Turkish mosque derived from the Byzantine plan of Saint Sophia (q.v.) at Constantinople. The masterpiece of the first type is the Hasan mosque at Cairo (1356), followed by those of Barkuk, Khawand al-Baraka, and others. Of the second type, besides the several superb examples at Constantinople (Sulaiman, Ahmad, and others) there is the earlier one at Isnik, and the model spread even to Egypt, as in the Sinan mosque at Bulak. Still another way of employing the dome appeared in certain of the mosques of India, as the Doshamma mosque at Delhi. Among the most famous and sacred of the early mosques were the *Masjid al-Haram* at Mecca (q.v.), the *Masjid al-Nabi* at Medina (q.v.), the *Masjid al-Aksa*, the Mosque of Omar at Jerusalem, and the great Mosque of Walid at Damascus. All of these have been rebuilt so that their early form is no longer recognizable. The old mosque at Kairwan (q.v.) is a well preserved early example (eighth century), as is also the Mosque of Tulun at Cairo; the Mosque of Amru at Cairo is of even earlier foundation, and still retains portions of old work. The Mosque of Omar represents the concentric mausoleum type. It is now two or three centuries since mosques of any architectural importance have been erected. The poorer mosques have bare whitewashed walls with no decoration of any kind. The larger and more pretentious are often elaborately and artistically decorated with carvings, arabesques, and passages from the Koran in the most involved style of ornamental calligraphy. Hundreds of oil lamps and sometimes ostrich eggs, elephant's tusks, and the like hang from the ceiling. The floor is usually covered with matting. A striking feature of mosque architecture is the minaret (q.v.).

The five prayers are said in the mosque daily. (See MOHAMMEDANISM.) The worshiper on entering removes his shoes, carries them in his left hand, sole to sole, and puts his right foot first over the threshold. He performs the necessary ablutions and takes his place in the congregation facing the *mihrab*. The attendance is more general on Friday, when some special prayers are said and a sermon (*khutbah*) is often added. A mosque which has this service is called *masjid al-jami'* ('mosque of the general assembling') or simply *jami'*. Women are not forbidden to enter the mosque, but their presence is not considered seemly during the time of prayer; sometimes a special place, secluded by a screen, is provided for them. There are few mosques to which unbelievers do not now have access. The utmost decorum and solemnity are observed during services, and the mosques are deeply revered by the faithful. At the same time they are intended for daily use, and when services are not going on are general gathering and lounging places; persons may be seen there sewing, spinning, or engaged in some similar handicraft; and they serve as resting places for travelers and wanderers. It has been the custom from the beginning for teachers and professors to give lectures and hold classes in the larger mosques, which thus serve as college buildings. The teacher takes his place at a pier or column at stated hours, his favorite pupil holds his books or

notes, and the audience sits around on mats. Several such courses are carried on simultaneously in different parts of the covered arcades. Until medressehs were built in the eleventh century, the mosques were probably the only regular seat of advanced teaching. In recent times the advanced education in the mosques has been largely confined to the preparation of candidates for the position of imam, but there are still notable exceptions. The Azhar Mosque in Cairo has long been the main centre of advanced instruction in Mohammedan countries, the only survivor of many finer mediæval institutions, and its courses are attended by between 5000 and 10,000 students. Minor buildings, such as school-rooms, academies, libraries, hospitals, dormitories, public kitchens, and almshouses, are often connected with the mosques.

The revenues of the mosques are derived not only from the contributions of the faithful, but also from investments in landed property (*wakaf*), often from gifts made centuries ago; this property is in the hands of trustees. The income serves to keep the building in repair and to pay necessary expenses. The mosque officials and attendants include the *'imam*, who leads the prayers, the learned men who teach (*maulawit*, *'ulamā*), the *khafiz* or preacher (in a *jami'*), the muezzins (q.v.), who call to prayers, door-keepers, lamp-lighters, etc. Their number depends entirely upon the revenues; sometimes a single imam combines in his person the functions of all the others. The imam has a salary from the revenues, but the teachers are dependent entirely upon the gifts of their pupils. See MOHAMMEDANISM. Consult the Bibliography of MOHAMMEDAN ART.

MOSQUERA, mōs-kā'rā, TOMÁS CIPRIANO DE (1798-1878). A Colombian politician and soldier, born at Popayan. At thirty-one he was general and Ambassador Extraordinary to Peru, and in 1833 was made Senator. From 1845 to 1849 he was President of New Granada, and greatly increased the material prosperity of the country. He headed the revolt against Ospina in 1859, and in 1861 became President of the country reorganized as the United States of Colombia; but was deposed in 1867 for arrogating to himself the power of adjourning Congress. He returned from banishment in 1869, and became Governor of Cauca and a Congressman.

MOSQUE SWALLOW. One of a group of related Asiatic and North African swallows within the genus *Hirundo*, whose prevailing colors are blue, with chestnut on the rump and side of the head, and buff or brownish streaked breasts. They are familiar town swallows wherever they occur, and take their English name from the habit of placing their nests commonly on the walls and minarets of mosques. These nests and their eggs are much like those of the American eaves swallow. The commonest Oriental species are *Hirundo daurica* and *Hirundo Nepalsensis*, and a conspicuous African one of large size is *Hirundo Senegalensis*. Consult Sharpe and Wyatt, *Monograph of the Hirundinidae* (London, 1885-94), and authorities upon East Indian birds cited under BIRD.

MOSQUITIA, mōs-ké-tā'. A strip of territory on the east coast of Central America. See MOSQUITO COAST.

MOSQUITO (Sp., Port. *mosquito*, diminutive of *mosca*, fly, from Lat. *musca*, fly). A biting fly of the family Culicidae. These flies belong to the group of nemocorous Diptera, and their nearest allies are the crane-flies, the midges of the families Dixidae, Stenoxenidae, and Chironomidae, the fungus-gnats, gall-gnats, and moth-flies, from all of which true mosquitoes are distinguished by the fact that the veins of the wing and the body itself bear flattened scales, readily perceived under a low power of the microscope. The family is a large one, and includes 22 genera and about 300 species. The number of described species has doubled within the last few years, since especial attention has begun to be paid to this group, and activity in research is now so great that it is probable that it may again be doubled before the mosquito fauna of the globe is fairly well known.

GEOGRAPHIC DISTRIBUTION. The mosquitoes form a cosmopolitan group, and extend practically to all known portions of the globe. Certain species are excessively abundant in the Arctic

ATLANTIC COAST MOSQUITO (*Culex sollicitans*).

regions, while the greatest number of species is to be found in the tropical and subtropical life-zones. Certain of the genera are very widely distributed, the typical genus, *Culex*, being found practically everywhere. *Anopheles* is represented in all regions except the Boreal and the Arctic; *Stegomyia* occurs in Southern Europe, North, South, and Central America, West Indies, Africa, India, Malay Archipelago, Eastern Asia, and Australasia. A similar distribution is found with others of the less conspicuous genera. Certain species are also of almost world-wide distribution, and this is doubtless largely due to the ease and frequency with which mosquitoes are transported by seagoing vessels and by rail-

MOSQUITO OF MALARIA (*Anopheles maculipennis*).

way trains, and to the extraordinary facility with which they accommodate themselves to a novel environment. It is a well-substantiated fact, for example, that there were no mosquitoes in the Hawaiian Islands until they were brought there by sailing vessels. Certain species have a remarkable range through different life-zones, and the group as a whole has only a slight faunistic value. *Culex cantans*, for example, occurs in Canada and the United States, throughout Europe, and in Southern India; *Culex pipiens* occurs throughout Europe from Scandinavia to Malta, all over North and Central America and the West Indies, and is also found in Oriental regions.

CLASSIFICATION. The family has been divided

by Theobald into six subfamilies, *Anopheles*, *Megarhinus*, *Culex*, *Ædomyia*, *Trichoprosopon*, and *Corethra* being the typical genera of these subfamilies. The last named, however, has a short proboscis not formed for piercing, and does not belong to the biting mosquitoes proper. The characters which have been relied upon mainly in the differentiation of the genera have been the comparative length of the palpi in the different sexes, the character of the terminal joints of the palpi, the relative proportions of certain of the cells of the wings, the characters of the scales of the legs and head, the bristles upon the metanotum, and certain other points connected with the relations of the veins of the wings. The species for the most part have been separated upon colorational characters, although certain characteristics of the wing-venation are specific rather than generic, and the study of the body scales reveals specific characters. There are also some interesting characters connected with the teeth of the foot-claws which are both specific and generic.

LIFE HISTORY. Mosquitoes in their early stages are all aquatic. The larvæ need a certain amount of standing water for their development. The eggs are laid by the adult insects, in the majority of cases upon the surface of stand-

MOSQUITO OF YELLOW FEVER (*Stegomyia fasciata*).

a

b

EGG OF ANOPHELES.

a, upper surface; b, under surface. These eggs float in disconnected masses. (Greatly magnified.)

ing water. They may be laid upon end, attached side by side in raft-shaped masses, as in *Culex pipiens* and as in the genus *Uranotenia*, or they may be laid singly on their sides, as in *Anopheles*, *Stegomyia fasciata*, *Psorophora*, and several species of *Culex*. They may also be laid upon moist earth in swampy places, as with *Culex sollicitans*, or upon the leaves of pitcher-plants, as with *Wyeomyia Smithii*, hatching in these cases when water eventually reaches them. The eggs of some species, as those last named and *Stegomyia fasciata*, will bear desiccation; but the vitality of others, as those of *Anopheles*, is destroyed when they are removed from the water for any length of time. The egg stage is temporary with perhaps the majority of species, but with others it is much longer, and may be the hibernating stage with certain forms. The larva is an active and voracious little creature, and is commonly known as a 'wiggler' or 'wig-

gler.' Its life as a rule is short, and with the great majority of the species it is a true air-breather, coming to the surface of the water at frequent intervals and extruding its respiratory tube in order to suck air into its tracheæ. With at least one species (*Wyeomyia Smithii*), and

EGGS AND LARVÆ.

a, a 'raft' of eggs of the common mosquito (*Culex*); b, a single larva ('wiggler') taking breath at the surface; c, a larva (enlarged).

perhaps with others, the anal locomotory flaps have an abundantly branched tracheal supply, and at least during part of the larval life these flaps function as air-gills, rendering it possible for the larva to remain below the surface of the water for a prolonged period of time. The food of mosquito larvæ is most variable. They swallow all sorts of minute organisms which float upon the surface or are held in suspension in the water. The larvæ of *Anopheles* feed for the greater part of their life at the surface, and consequently devour mainly the spores of algæ which float there. Later in life in shallow water they descend to the bottom and feed upon heavier objects. The larvæ of *Culex* feed below the surface upon small organisms, animal and vegetable, and mineral as well, which are held in suspension. The larvæ of *Psorophora* seem largely carnivorous, and, on account of their large size, are able to overpower and to devour other mosquito larvæ and other aquatic insects. They are even cannibals, and will feed upon small individuals of their own kind. All mosquito larvæ are very active, wriggling quickly through the water by abrupt and rapid bendings of the body, aided in some cases by long lateral hairs, and especially by a well-developed group of flaps at the anal end of the body. Food is brought into the mouth by the active movement of long oral cilia. In many forms the jaws are undeveloped, but in some, as in *Psorophora*, they are well formed and adapted for piercing and tearing.

The pupa is also active, but does not feed, and possesses no mouth parts. As a rule it floats at the surface of the water, breathing through two respiratory tubes which issue from the thorax—a curious change from the respiratory tube of the larva, which is single and issues from the anal end of the abdomen. Although generally floating at the surface, the pupa when disturbed rapidly vanishes below the surface by energetic movements of the abdomen and of the anal flaps, and is thus enabled to a certain extent to avoid the attacks of fish and other enemies. The pupal stage is usually of short duration, and the adult issues through the cracking of the skin of the thorax. With many mosquitoes there are several generations annually. With *Culex pipiens* and *Anopheles maculipennis*, for example, there may be from eight to twelve such

generations in a long summer. With other species it seems reasonably certain that the life-duration of the individual is much greater, and that in some cases there may be but a single generation each year. Most mosquitoes hibernate as adults, stowing themselves away in protected places at the beginning of cold weather. Other species undoubtedly hibernate in the egg stage, and still others unquestionably hibernate as larvæ, readily standing extremes of temperature, and even emerging in good condition with the warm weather of spring from blocks of ice in which they have been solidly frozen.

AGENCY OF MOSQUITOES IN CARRIAGE OF DISEASE. Since 1898 mosquitoes have become of vital importance to the human race, following the discovery that they are secondary agents in the carriage of several diseases of human beings, notably malaria and yellow fever. See INSECTS, PROPAGATION OF DISEASE BY.

RIDDANCE OF MOSQUITOES. The most effective way of relieving a neighborhood of mosquitoes consists in abolishing the breeding places. All accumulations of stagnant water—and these are of the most varied and frequently inaccessible character—must be removed wherever it is possible. Swampy lands should be drained; hollows in old trees and stumps should be filled up; old cans and bottles should be removed; cesspools should be hermetically sealed; rain-water barrels should be covered with fine wire gauze; the roof-troughs of houses should be frequently cleaned out. No possible supply of standing water should be overlooked, and these will in many cases require a most careful and ingenious search. Where mosquitoes are breeding in troughs or large cement basins which are used for watering stock, fish, such as sunfish, goldfish, or top minnows (qq.v.), should be introduced. Where other ponds exist which it is not possible to drain, the water margins should be kept clean and sharp, and superabundant vegetation should be removed. Moreover, if the fish supply of such ponds cannot be made satisfactory, a certain amount of kerosene placed upon the surface of the water will quickly destroy mosquito larvæ. This kerosening of swamp lands, where drainage is impossible or very expensive, is often a temporary remedy of great value. In malarial regions persons may be protected from the bite of the dangerous and annoying mosquitoes by the careful screening of houses and by wearing mosquito veils and gloves at night when obliged to be out of doors. *Anopheles*, as a rule, bites only at night. By this method the Italian Government has greatly reduced malaria in the black belt of Italy. By protecting healthy persons and malarial patients as well, and by the free use of quinine with the patients, the general health of the population of that region has greatly improved. The Germans in East Africa believe that they can wipe out malaria by simply destroying the disease with medicine. Malaria once abolished in human beings, there will be none for the mosquitoes to carry. In the United States extensive work has been done in the destruction of breeding places and thus reducing the numbers of mosquitoes. Under such conditions malaria will die out. In Cuba, aside from protecting the early yellow-fever patients and the constant use of mosquito bars in hospitals, yellow fever has been exterminated by

house-to-house work against the breeding places of *Stegomyia*, this work being carried on first by the medical officers of the United States Army, and later by the health authorities of the Cuban Government. Mosquitoes, as a rule, may be stupefied by burning pyrethrum powder (Persian insect powder). They may also be deterred from biting by anointing the skin with oil of citronella.

Consult: Howard, *Mosquitoes* (New York, 1901); Ross, *Mosquito Brigades* (London, 1902); Theobald, *A Monograph of the Culicidae of the World* (ib., 1901); Celli, *Malaria* (ib., 1900); Giles, *Gnats or Mosquitoes* (2d ed., ib., 1902); North Shore Improvement Association, *Report on Mosquitoes* (New York, 1902); Berkeley, *Laboratory Work with Mosquitoes* (ib., 1902).

MOSQUITO, mós-ké'tó (corruption of the native name *Misskito*). A considerable people apparently made up of several tribes, which occupies that portion of the eastern coast of Nicaragua known from them as Mosquitia or the Mosquito Coast (q.v.). They are an intelligent people, short in stature, and usually very dark in color. This latter trait is said to be due in part to admixture with negro blood from slavers wrecked upon their coast. They number about 6000 souls. Consult Squier, *The States of Central America* (2d ed., New York, 1888); and (anonymous) *Waikna*.

MOSQUITO BEE. Any one of several of the very small, stingless tropical honey-bees of the genus *Melipona*, which form communities, consisting at times of countless numbers. They are among the smallest of the bees, and although they do not sting, all the essential elements of the sting are present, the pointed or penetrating part of the apparatus being stunted. One species (*Trigona* or *Melipona mosquito*) sends off swarms after the manner of the common hive bee. The nests abound in honey, and have many enemies, since the bees cannot defend themselves by stinging. The nests, however, are rich in devices for protection and for the exclusion of intruders. Some species of them build their nests in completely with clay. See BEE.

MOSQUITO BLIGHT. A disease of the tea plant in India and Ceylon, caused by the punctures of several of the species of the genus *Helopeltis* of the plant-bug family Capsidæ. The young bugs as well as the adults feed upon the leaves and young twigs of the plant, causing them to wilt.

MOSQUITO COAST, or Mosquitia. The strip of territory inhabited by the Mosquito Indians on the eastern coast of Central America, stretching along the Caribbean Sea from about latitude 10° 30' N. to latitude 13° and extending about 40 miles inland (Map: Central America, F 4). It is notable chiefly for the fact that it was for a time the subject of diplomatic controversy between the United States and Great Britain. From about 1685 to 1850 it constituted a protectorate under the nominal control of Great Britain, during which time various attempts were made to plant colonies there, but only with partial success. Both the Central American republics and the United States denied the claim of Great Britain to a protectorate over the Mosquito Coast, the latter particularly on account of the contiguity of the territory to the proposed in-

ter-oceanic canal which the United States wished to construct or cause to be constructed. The seizure in 1848 of Greytown (San Juan del Norte), an important commercial port at the mouth of the San Juan River, in Nicaragua, by the Mosquito Indians with the aid of England, caused great excitement in the United States, and for a time war seemed possible. To avert this danger, however, and to obtain a basis for a uniform policy of abstention from interference in the region by both England and the United States with a view to securing the neutrality of the proposed canal, the Clayton-Bulwer Treaty of 1850 was concluded between the two countries, by which it was agreed that neither party would occupy, fortify, colonize, or exercise dominion over the Mosquito Coast, or any part of Central America. By a treaty of November 28, 1859, with Honduras, Great Britain ceded to that republic its claim to the protectorate hitherto exercised over the Mosquito Indians and agreed to recognize as belonging to and under the sovereignty of Honduras all territory occupied by the said Indians. This arrangement was very unsatisfactory to the Indians and led to a revolt among them. The difficulty was finally adjusted by the Treaty of Managua between Great Britain and Nicaragua of January 28, 1860, by which it was stipulated that Great Britain would recognize the sovereignty of Nicaragua over the Mosquito territory lying within its bounds; that a certain district should be assigned to the Indians; and that the British protectorate should cease within three months after the exchange of ratification. A dispute having arisen between Nicaragua and the Mosquito nation in regard to the interpretation of the treaty, the Emperor of Austria was requested to decide upon the true meaning of the clauses in dispute, which he did in 1880, holding that the sovereignty of Nicaragua over the Indians was limited by the right of self-government conceded to them by the treaty. From that time onward the natives enjoyed almost complete self-government. By an agreement entered into between Nicaragua and the Mosquito Indians in 1894 they were formally and voluntarily incorporated into the Republic of Nicaragua, their country becoming the Department of Yelaya. The population of the territory in that year was about 15,000. Consult Travis, *Clayton-Bulwer Treaty* (Ann Arbor, 1893).

MOSQUITO-HAWK. The name of several animals which dart about after small flying insects, as (1) a nightjar or 'nighthawk'; (2) a dragon-fly (q.v.).

MOSQUITO LAGOON. A salt-water lagoon on the eastern coast of Florida, United States (Map: Florida, H 3). It is a continuation of Halifax River, and extends 30 miles south of Mosquito Inlet to Haulover Canal, which connects it with Indian River. It has an average width of one mile; it is shallow, and navigation even by small boats is impeded by coral beds, sandbanks, and mangrove swamps. Oysters and fish abound in its waters. A strip of land from a half mile to five miles wide separates the lagoon from the ocean.

MOSS, mós. A town of Southeastern Norway, situated on the east shore of the Christiania Fjord. 33 miles south of Christiania, on the railroad between the capital and Frederikstad. It

has a good harbor visited by steamers, and trades in wood and preserves. Population, in 1900, 8941. In 1814 the treaty was signed at Moss by which Norway consented to a union with Sweden.

MOSS (MDutch, Dutch, OHG. *mos*, Ger. *Moos*, moss; connected with Lat. *muscus*, OChurch Slav. *múchŕ*, Lith. *músat*, Welsh *mwsog*, moss). A plant belonging to the group Musci (q.v.) of the bryophytes (q.v.).

MOSS AGATE. See MOCHA STONE.

MOSSÁMEDES, mós-sá'má-dēs. The chief town of the District of Mossamedes, Portuguese West Africa, situated on the Atlantic coast 150 miles north of the mouth of the Kunene (Map: Africa, F 6). It is a well-built and regularly laid out town, with a fine Government building, church, hospital, and a fort. The harbor is excellent, and equipped with an iron pier, and the trade is considerable. The chief exports are rubber, cattle, and dried fish. Population, 4500.

MOSS-ANIMALS. See POLYZOA.

MOSSBUNKER (from Dutch *marbanker*, probably from *mar*, peddler's pack, or possibly from *mas*, crowd + *bank*, bank; so called in allusion to the appearance of the fish in shoals). A name (heard about New York and New Jersey) for the menhaden (q.v.). It is said by Goode (*Fishery Industries*, Sec. I., Washington, 1884) that the word is a relic of the early Dutch, who took it from their name for the horse mackerel of Europe, which was 'marshbanker.' It has survived in some localities in New Jersey in its original form, but is more usually cut down and changed to 'bunker' about New York and Long Island Sound.

MOSESSES FROM AN OLD MANSE. A collection of tales by Nathaniel Hawthorne (1846). Many of his famous sketches are contained in it.

MOSSLEY, mós'li. A municipal borough in Lancashire, England, on the Tame, three miles southeast of Oldham (Map: England, D 3). Its importance dates from 1840, when there were established cotton and woolen factories, mill works, and foundries. The town hall is a handsome structure. The municipality owns its markets and its gas works, and maintains recreation grounds. Population, in 1901, 13,450.

MOSSO, mós'só, ANGELO (1846—). An Italian physiologist. He was born at Turin, studied medicine there, at Florence, Leipzig, and Paris, and in 1879 was appointed professor of physiology at Turin. He invented various instruments to measure the pulse, and experimented and wrote upon the variation in the volume of the pulse during sleep, mental activity, or emotion. In 1900-01 he visited the United States and embodied the results of his observations in *Democrazia nella religione e nella scienza* (1901). Among his other works are: *Die Diagnostik des Pulses* (1879); *Sulla paura* (1884, trans. into German and French); *Die Temperatur des Gehirns* (1894); and *Der Mensch auf den Hochalpen* (1898).

MOSS PINK. A flowering plant. See PHLOX.

MOSS SIDE. A manufacturing town in Lancashire, England, 1½ miles southwest of Manchester (Map: England, D 3). It is provided with gas, electric lighting, and water by the Manchester corporation. The town owns its tramways and slaughter-houses, maintains a

free library, and provides for technical education. Population, in 1891, 23,800; in 1901, 26,700.

MOST, JOHANN JOSEPH (1848—). A German-American anarchist, born at Augsburg in Bavaria. He learned the trade of bookbinding, and in 1863-68 traveled as an apprentice through Germany, Austria, Italy, and Switzerland. On his return to Germany he was first a socialist writer at Mainz and afterwards editor of the *Freie Presse* in Berlin. He was several times arrested and imprisoned because of the violence of his writings. From 1874 to 1878 he was a representative of Chemnitz in the Imperial Reichstag, but in the latter year, having been expelled from the socialist organization, he went to London, where in 1879 he founded the anarchist organ *Die Freiheit*. In 1881 he was there arrested for printing editorials approving the assassination of Czar Alexander II. and sentenced to eighteen months' imprisonment. Upon his release he emigrated to New York, where he resumed the publication of his paper. In 1886, and again in 1887, he was imprisoned for inciting to violence. During the following years he continued to publish his paper, lectured, and wrote frequently in the interests of anarchy. After President McKinley's assassination, in 1901, he was arrested for publishing a seditious editorial in *Die Freiheit*, and was sentenced to one year's imprisonment. He was sent to the New York penitentiary in June, 1902. Among Most's publications are: *Der Kleinbürger und die Sozialdemokratie* (1876); *Die Lösung der sozialen Frage* (1876); *Mos's Proletarier-Liederbuch* (1875); *Why I Am a Communist* (1890); and *Down with the Anarchists!* (1901), a pamphlet published in order to prove that the aims of anarchy are pacific.

MOSTAGANEM, mós'tá-gá-nēm'. A fortified seaport of Western Algeria, in the Department of Oran, situated on a steep cliff on the Mediterranean coast 45 miles east of Oran (Map: Africa, E 1). It has flour mills and tanneries, and an active trade in wool, skins, and horses. It is connected by a branch road with the railroad from Oran to Algiers. Population, in 1901, 17,485; of commune, 18,090. Mostaganem was a large and important trade centre in the sixteenth century, but later fell into decay. It has again prospered since its capture by the French in 1833.

MOSTAR, mós'tár. The largest town and former capital of Herzegovina (q.v.), situated on the Narenta about 50 miles southwest of Serajevo, with which it is connected by rail (Map: Austria-Hungary, E 5). It has a number of modern buildings, but is essentially Oriental in appearance, with its numerous mosques, bazaars, and Turkish shops. There are a fine Greek cathedral, a higher gymnasium, and a number of trade schools. Tobacco and arms are the chief products. Mostar is the seat of a Roman Catholic and a Greek bishop, as well as of a mufti, and has a strong garrison. Population, in 1895, 17,020, including over 7000 Mohammedans.

MOSTELLARIA (Lat., ghost). An entertaining comedy of a haunted house, by Plautus, which appears to have been adapted from the *Phasma* of Philemon. The plot is ingenious and the characters are well drawn.

MOSUL, mò-sòs'l'. The capital of the Vilayet of Mosul, Asiatic Turkey, on the Tigris, opposite the ruins of ancient Nineveh (q.v.), and 220 miles by river northwest of Bagdad (Map: Turkey in Asia, K 4). It is surrounded by walls now almost in ruins. Of the ancient buildings only the Great Mosque remains. Mosul is the seat of a Roman Catholic mission, Dominican schools, and French and Russian consuls. Its trade, formerly much greater, is now confined to cotton, hides, wax, nuts, gum, and wool, all carried chiefly by caravans. The principal causes of its diminished importance were the rise of Abushehr (q.v.) as an emporium of trade, and the diversion of traffic by the Suez Canal. Population, about 55,000, chiefly Arabs, but comprising also Kurds, Turks, Armenians, Christians, and Jews. Mosul was an old Arabic town, taken by the Moslems in 636. It was besieged by Saladin in 1182, and was successively under Mongol, Persian, and Turkish sway. In the twelfth century it was very important, and for a time supplied Europe with its manufactures, especially muslins, which probably got their name from this town.

MOSZKOWSKI, mòsh-kòf'skà, MORITZ (1854 —). A Polish composer and pianist, born at Breslau. He studied at the Dresden Conservatory and in Berlin. At nineteen years of age he made his debut as a piano virtuoso, and after successful tours throughout the principal European countries settled in Berlin, in which city he subsequently made his headquarters, although after 1897 he became almost entirely identified with the musical life of Paris. The best known of his works is *Spanish Dances*, which nowhere met with greater success than in America, and which may be said to have introduced him to the world at large; he also wrote many pieces for piano-forte, chamber music, concert studies, and waltzes. Among the larger works are: *Boabdil der Maurenkönig* (1892); incidental music to Grabbe's *Don Juan und Faust* (1896); a symphonic poem, *Jeanne d'Arc*; overtures, and concert suites.

MOTAZILITES, mò-tà'zì-lìts. See MUTAZILITES; MOHAMMEDAN SECTS.

MOTET' (from It. *motetto*, diminutive of *motto*, word, from ML. *muttum*, word, grunt, from Lat. *muttire*, *mutire*, to mutter). A sacred vocal composition without instrumental accompaniment, in polyphonic style. As a rule the text of motets is Latin; but there are also motets with German, Italian, and English words. Although the *a capella* style is the rule, it was not always followed. Especially during the first half of the seventeenth century, which witnessed the beginnings of instrumental music, it was not unusual to add a *basso continuo*, or even a number of violin parts. In some instances we find even motets for a solo voice with instrumental accompaniment. The motet must not be confounded with the *anthem* (q.v.), in which latter form *homophony* (q.v.) is always employed. The form of the motet is very old and has undergone many changes with the various styles of music. The oldest motets were constructed on a *cantus firmus* (q.v.). From the *Ars cantus mensurabilis* of Franko of Cologne we learn that a motet had two different texts in the alto and tenor parts. J. S. Bach, in his motets, substi-

tutes the Protestant chorale for the *cantus firmus*.

MOTH (AS. *moþe* Ger. *Motte*, moth; perhaps connected with Goth. *maþa*, OHG. *mado*, Ger. *Made*, AS. *maþpu*, *maþa*, Eng. *mad*, *mado*, maggot, grub). An insect of an indefinable section of the Lepidoptera (q.v.), separated from butterflies by superficial features and habits. No scientific distinction exists between these two, and the terms Rhopalocera for the former and Heterocera for the moths have been abandoned in taxonomy. Moths as a rule are nocturnal, while butterflies, as a rule, fly by day. Moths rest in most cases with the wing horizontally disposed, while butterflies hold them erect, displaying the under surface. The antennæ of moths are likely to be feathery in shape, while those of butterflies are thread-like, swollen toward the end into a 'club-head.' The nearest to a structural division is made by the fact that all so-called moths have a jugum, or 'hook and eye,' upon the fore wing by which these wings are held together in flight, while such a structure is absent from the butterflies. (See BUTTERFLIES AND MOTHS.) All but four families of Lepidoptera, and by far the greater number of species and individuals, are moths. They are, however, less conspicuous than their relatives, on account of their generally smaller size and inconspicuous hues, but mainly because of their nocturnal habits. They are of more importance, too, in their relations with mankind than the ornamental butterflies, which do comparatively little either of harm or good beyond the delight their beauty affords. The moths, on the contrary, supply the useful product silk, on the one hand, and on the other furnish a great variety of species, which, especially in the larval stage, do enormous damage to growing crops and fruit, as well as to stored grain and food-stuffs, and to a long list of materials, in both their raw and manufactured states. The accompanying colored plate represents moths of various families, and exhibits the form and style of coloration assumed. The species figured are described elsewhere. See BUTTERFLIES AND MOTHS.

MOTH, BROWN-TAILED. A name given in England and New England to the European moth, *Euproctis chrysorrhæa*. The moth is white in color with a brown tip to the abdomen. Its larva feeds on a great variety of trees, and is gradually spreading in New England. The best remedy is to burn the larvæ cases during the winter.

MOTHER ANN. A name given to Ann Lee (q.v.), the founder of the Shakers.

MOTHER BUNCH. A nickname given by Tucca to Mistress Miniver, the ale-wife, in Dekker's *Satiromastix* (1602). The name was applied later to makers of jokes, as in *Pasquil's Jests*, *Mixed with Mother Bunch's Merriments* (1604); and in *Mother Bunch's Closet Newly Broke Open* (1760).

MOTHER CAREY'S CHICKEN (possibly corrupted from Lat. *mater cara*, dear mother, in allusion to the Virgin Mary). A name familiarly given by sailors to the stormy petrel and other small black and white species of petrel. The name 'Mother Carey's goose,' or hen, is in like manner given to the great black petrel or 'bone-breaker' (*Ossifraga gigantea*) of the Pacific Ocean, which is a ravenous feeder on dead whales

and other animal garbage, and also preys upon other sea-birds. See PETREL.

MOTHER GOOSE. The supposed author of the familiar nursery rhymes known as *Mother Goose's Melodies*. A baseless claim that the name originated in Boston was made on behalf of Elizabeth Goose, whose rhymes were printed by her son-in-law, Thomas Fleet, as *Songs for the Nursery*; or, *Mother Goose's Melodies* (Boston, 1719). The title appears to have come from France, where Queen Goosefoot, or Bertha au Grand Pied, the mother of Charlemagne, was regarded as the special patron of children, and her festival, January 2d, is celebrated. The most definite source is Charles Perrault's *Contes de ma mère l'Oye* (1697), containing ten stories, seven of which are from the *Pentamerone*. It was translated by Robert Samber in 1729. *Mother Goose's Melodies* were printed in London by John Newbery in 1760. Though the title is probably of French origin, the songs are English, some belonging to the time of Shakespeare and earlier.

MOTHER GOOSE TALES. See NURSERY LORE.

MOTHER HUBBARD'S TALE, or PROSOPOPIA. A metrical composition by Edmund Spenser (1591), written in his youth. It is a satire on Court follies, under the guise of a story of a fox and an ape masquerading as a soldier and his servant. It purports to have been told to the poet by Mother Hubbard.

MOTHER-OF-PEARL. The shells of the large marine bivalve mollusks *Avicula* (*Meleagrina*) *margaritifera*, *Avicula macroptera*, and *Avicula fuenta*, which also produce the precious pearls. (See PEARL.) These shells are collected in the tropical seas, chiefly on the coast of Ceylon, Manila, Cuba, Panama, the Gulf of California, and the South Sea Islands. In 1865 extensive fishing grounds were found on the north-west coast of Australia. The shells from Panama are small and thick and are known in commerce as bullock shells. Those from Manila and Australia are finest in quality; they are disk-shaped and often as much as a foot in diameter. There are two varieties, the white, or silver-lipped, and the black-lipped. The mother-of-pearl or nacre of commerce is really the inner portion or lining of the shell, which the oyster secretes in successive layers of filmy thinness and marvelous smoothness of surface. Some fine mother-of-pearl is also produced in inland waters, chiefly in the rivers of China, Germany, and Russia. Recently the shells of a kindred Mississippi River mollusk have been used in the manufacture of pearl buttons. See BUTTON; PEARL OYSTER.

MOTHER OF PRESIDENTS. A name frequently given to the State of Virginia, which has furnished more Presidents to the Union than any other State. The following seven were born there: George Washington, Thomas Jefferson, James Madison, James Monroe, William H. Harrison, Zachary Taylor, and John Tyler. See STATES, POPULAR NAMES OF.

MOTHER OF STATES. A name given to Virginia as the oldest of the thirteen American colonies, and because its original territory was formed into a number of States—West Virginia, Kentucky, Ohio, Illinois, and Indiana.

VOL. XIV.—8.

MOTHER SHIPTON'S PROPHECIES. A series of foretellings of events purporting to have originally been told by a woman named Agatha or Ursula Shipton, of Yorkshire, between 1486 and 1561. They appeared in chap-books or pamphlets, the earliest known of which was printed in 1641, and were continued until recent times. Charles Hindley wrote some prophecies purporting to have dated from 1448. It has been suggested that Mother Shipton was Master William Lilly, an astrologer, 1602-1681.

MOTHERWELL, mŭth'ēr-wĕl. A police burgh and manufacturing town in Lanarkshire, Scotland, 12 miles southeast of Glasgow (Map: Scotland, E 4). Its growth and importance are due to its iron and steel works and its neighboring collieries. It has fine municipal buildings, owns its water-works, and maintains a public park, etc. Population, in 1841, 726; in 1901, 30,423.

MOTHERWELL, WILLIAM (1797-1835). A Scotch poet, born and educated in Glasgow. His first appearance in print was as editor of a volume of local poems (1819). His *Minstrelsy Ancient and Modern* (1827) won him the acquaintance of Scott. With Hogg, too, Motherwell was on friendly terms, and in 1835 the two prepared an edition of Burns's poems. Motherwell died of apoplexy in the same year, overcome by the strain of testifying before a Parliamentary committee on Orangeism. In his *Poems, Narrative and Lyrical* (1832), he utilizes Scotch and Norse mythology and occasionally shows some lyric power, as in the well-known "Jeanie Morrison," which tradition says was planned when he was only fourteen.

MOTH-FLY. Any one of the true flies of the family Psychodidæ—very small, weak flies which look like little moths and are frequently found upon windows and upon the under surfaces of leaves. They have broad wings, rather thick antennæ, and are densely clothed with hairs, even the surface of the wings being hairy. These are the only true flies, except true mosquitoes, which have hairs or scales on the wings. In the arrangement of the wing-veins these flies differ from all other Diptera, and probably represent the most generalized type in this order of insects. They differ greatly in larval habits: some live in rapidly running water, others on fallen leaves in small pools, others are found in rotten potatoes, while some live in dry cow-dung. The larvæ have both tracheal gills and open spiracles, so that theoretically they can breathe both air and the oxygen of the water. The family has a wide distribution, but only about 20 species are known in the United States.

MOTH-HUNTER. A bird, the nightjar (q.v.).

MOTILÓN, mŏ'tŏ-lŏn' (Sp., Cut-haired). A fierce tribe of Cariban stock (q.v.), inhabiting the mountains known as the Painted Andes, about Ocaña, in Northeastern Colombia. They were conquered in the early Spanish period and colonized in the lowlands under supervision of missionaries, but on the outbreak of a smallpox epidemic they were compelled to cut their hair to cool the fever, and were otherwise subjected to such sanitary regimen that they rebelled and fled to the mountains. They were fugitives for half a year, but returned on the subsidence of the

epidemic. On a recurrence of the epidemic some years later the Indians again fled to the mountains, where they have since remained. For nearly two centuries they have been distinguished for their aggressive and untamable hostility to the whites, so that very little is definitely known of them. See YAMEO.

MOTION. See MECHANICS.

MOTION (Lat. *motio*, from *movere*, to move, Skt. *mv*, to push). In law, an application to a court to obtain a direction, or order, as it is termed, in relation to some question or matter incidental or collateral to the main issues of the action. Generally, motions raise questions of both law and fact, and it often becomes a serious question as to whether a matter can be decided by the court on motion or whether there is such a controversy as will entitle the party against whom the relief is sought to a trial. A motion differs from a trial, which is the method of determining the substantive rights of the parties to an action on the main issues raised by the pleadings, whereas a motion is usually made to expedite the progress of the cause, or for summary relief preliminary to the trial of an action, and cannot bring up the entire merits of the action, and is based upon affidavits and other documents.

Where there is a question to be decided by the court on which the parties may reasonably differ, the motion can only be made after due notice to the opposite party. Generally any person interested in the subject-matter of an action is entitled to make a motion to protect his interests therein, whether he is a party to it or not. See articles AFFIDAVIT; DECREE; JUDGMENT; TRIAL.

MOTION (in Music). The progression of the various voices or parts in a composition. Two voices proceed in *contrary motion* when one ascends, the other descends; in *parallel motion* when both ascend or descend; in *oblique motion* when one remains on the same tone while the other proceeds either ascending or descending. In compositions for three or more voices all three kinds of motion may appear simultaneously. Progression of voices in *parallel motion* requires the greatest care because it is here that faulty progressions (fifths, octaves) appear. For this reason the beginner would do well to lead the soprano and bass in *contrary motion* whenever possible. For examples of the different kinds of motion, see Ex. 13, under HARMONY.

In respect to the tones of a single part a distinction is made between *conjunct* and *disjunct* motion. In the former case the notes proceed either by steps or semisteps; in the latter by intervals greater than a whole step. The following two examples from Beethoven illustrate this:

MOTIONS. A name given to a kind of puppet-shows, especially illustrating Scriptural stories. Motions thrived in England in the fifteenth century.

MOTIVE (ML. *motivus*, moving, from *mo-vere*, to move). In psychology, a general term for the conscious conditions of action (q.v.). As these conditions include always processes of two kinds, sensory and affective, the motive falls into two parts: the inducement, the sensory or 'intellectual' process, the 'reason' for action; and the incentive, the affective process which prompts to it. Thus a thief is induced to steal by the sight of the unguarded loaf; the incentive to his theft is the unpleasant feeling of hunger. The typical motive to action is the impulse (q.v.). See ACTION.

MOTIVE. In music, the original germ from which all musical form is evolved. A motive generally fills one measure, and two motives constitute the *section*. (See FORM.) The simplest form of motive is the *rhythmic* motive considered apart from the melodic and harmonic progressions, in conjunction with which it generally occurs. Thus the *rhythmic* motives underlying the principal subject of Beethoven's Symphony in A major is:

and the *complete* (rhythmic, melodic, harmonic combined) motive is:

However, there are also purely rhythmical motives which are set against other complete motives. A famous example is furnished in Beethoven's C minor Symphony, where the rhythmic motive of the principal subject is sounded on the basses against the secondary subject of the violins. In a wider sense the term *motive* is used almost synonymously with *theme*. In the use of this term musical terminology is very careless, for *motive* more frequently is applied when *theme* or *subject* should be used. Hence, in theoretical works the word *measure-motive* is adopted to denote the simplest form as explained above. The *leading motives* in Wagner's works should properly be called *leading themes*. See LEITMOTIV.

MOTLEY, JOHN LOTHROP (1814-77). An eminent American historian, born in Dorchester, Mass., April 15, 1814. He entered Harvard College at the age of thirteen, and was graduated in the class of 1831. The two years following he spent in Germany at the universities of Göttingen and Berlin, and here he formed an intimate personal friendship with Bismarck, which continued till his death. On his return he studied law. He was married, in 1837, to Miss Mary Benjamin, of Boston. Motley's first venture in literature was a story entitled *Morton's Hope* (1839), a very unsuccessful historical-romantic novel. In 1841 he was made secretary of the American Legation at Saint Petersburg, but, owing to the severity of the climate and his regret at being separated from his family, he soon resigned. His first work revealing his real power was a review of a memoir of Peter the Great, which he wrote for the *North American Review* in 1845. Two years later he published in the same periodical a scholarly article on Balzac, and in 1849, for the same organ, a review of Talvi's *Geschichte der*

Colonisation von New England, a paper showing accurate knowledge of the history of New England and of the Puritan movement, and displaying philosophical insight. The same year saw the appearance of his *Merry Mount*, an historical novel dealing with an episode in the early life of the Massachusetts Colony.

With this novel, and with an unsuccessful term in the Massachusetts Legislature, ended what may be called Motley's experimental period. He saw the true path for his genius to follow, and he was seized with the desire to write, to cite his own words, 'one particular history,' that of the Dutch. Having obtained the approbation of the historian W. H. Prescott, on whose territory he feared he might be trespassing, he began to gather material in America, and in 1851 he set sail for Holland to continue his researches. In 1856 appeared the *History of the Rise of the Dutch Republic*, a work in three volumes, published at his own expense. The same year Motley returned to Boston, where he remained about a year; then he went to England in 1858. Here he received the degree of D.C.L. from Oxford, and in 1860 he published the first two volumes of his *History of the United Netherlands*. In England he did his country good service by sending (1861) to the *London Times* two letters on the causes of the American Civil War, which helped to dissipate the British misunderstanding of American affairs. In 1861 he was appointed Minister to Austria, and in Vienna he served the United States faithfully and with tact, until misunderstanding and calumny caused him to resign in 1867. In 1868 appeared the last two volumes of the *History of the United Netherlands*, a book which sustained the high reputation of his earlier work and its own earlier volumes.

President Grant, on his election, appointed Motley Minister to England, but he recalled him in November of the following year (1870), for what appear to have been unsatisfactory reasons. Motley then retired to private life, and began work on the last of his histories. This was *The Life and Death of John of Barneveld, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years' War* (1874), which, in two volumes, virtually completed his plan of the history of Holland and the Dutch. It was his last work. He had suffered an incapacitating paralytic stroke in 1873, and the death of his wife in 1874 was a heavy blow. He himself lingered three years longer, and died in Dorchester, England, May 29, 1877.

Motley takes rank with the most distinguished of American historians. His work presents a finished and often brilliantly colored picture of the times and the country with which it deals. It was written only after a thorough examination and analysis of all available documents, and is philosophical as well as pictorial in its treatment. It is full of an inspiring love of freedom, has the advantage of dealing with an heroic movement, displays marked skill at characterization, and often flashes with wit. His *Correspondence* is scarcely less brilliant, and affords many glimpses of interesting personages, both American and European.

The histories are published in good English and American editions. There is a memoir by his intimate friend, Oliver Wendell Holmes (Boston, 1878); *The Correspondence of John Lothrop*

Motley was edited (New York, 1889) by G. W. Curtis.

MOTMOT (onomatopoeic, in imitation of the bird's note). A bird of the family Momotidae, related to the coraciiform bee-eaters, todies, and kingfishers. The motmots are peculiar to tropical America, and only one of the 15 species occurs as far north as the United States. They are birds of very brilliant plumage and about the size of a blue jay, but more slender in form; are solitary in habits, and live on insects, reptiles, and fruits. Their most peculiar feature is the long tail, in which the middle pair of feathers are longer than the rest, and have a peculiar shape which has caused them to be called 'racket-feathers.' The cause of the peculiarity has been greatly discussed, but there is much evidence to

TAILS OF MOTMOTS.

a, Lesson's motmot, central rectrices perfect; b, the same, rectrices denuded; c, Mexican motmot, central rectrices affected while yet growing; d, blue-headed motmot showing 'rackets' resulting from complete denudation of a part of the feather.

show that it is brought about by the birds themselves biting away the vanes from the denuded part. One species (*Momotus caeruleiceps*) reaches the Mexican boundary of the United States. Consult: Belt, *Naturalist in Nicaragua* (London, 1888); Murie, *Ibis* (London, 1892). See Plate of KINGFISHERS, MOTMOTS, ETC.

MOTOORI NOBINAYA, mō'tō-ō'ri nō'ri-nā'yā (1730-1801). A Japanese scholar, the greatest authority, until the era of modern research, upon the customs, history, poetry, and religion of ancient Japan. He wrote many books, his most important being a commentary on the *Kojiki* (Records of Ancient Matters, the oldest extant Japanese book). The commentary is in forty-four volumes. It was begun in 1764 and finished in 1796. Upon the publication of the first part students came to Motoori from all parts of Japan. In 1801 he lectured in Kioto to crowds, princes and nobles being among his auditors. His influence increased after his death, and his writings are thought to have aided in bringing about recent changes in the Empire. He is regarded as a master of literary style.

MOTOR CARRIAGES AND VEHICLES. See AUTOMOBILE.

MOTOR-GENERATOR. See DYNAMO-ELECTRIC MACHINERY.

MOTOR ORGAN (Lat. *motor*, one who moves, from *movere*, to move). A structure which when stimulated moves the parts attached. Motor organs are found at the base of leaves and leaflets in various plants, particularly members of the bean family (Leguminosæ). They are formed by the modification of the structure

of the main leafstalk and of the stalks of the leaflets (Fig. 1). When the latter are short the motor organ may constitute the whole stalk. The motor organ is a cushion (pulvinus) of thin-walled tissue (parenchyma) whose centre is occupied by a strand of fibro-vascular and mechanical tissue (Fig. 2). This is in sharp contrast with the structure of the stalk elsewhere. There the outer parenchyma forms the usual cortex, the vascular and mechanical strands are distinct and often numerous, and the centre is occupied by a pith (parenchyma) of considerable volume. The central position of the strands in the motor

FIG. 1. MOTOR ORGANS OF LEAF OF BEAN.

The primary organ at the base of main petiole; secondary ones at the base of each leaflet; the lower figures show the curvature of these organs after stimulation (blades cut away to show more clearly).

organ obviously permits freer bending. The cells of the parenchyma are normally turgid, and by mutual pressure the organ is kept rigid, supporting the leaf or the leaflet. The action of an appropriate stimulus on the plant results in the exudation of water from the cells on one side of the pulvinus. This water passes into the intercellular spaces of the organ and the cells of course lose their turgor. Owing to the now unopposed pressure of the still turgid cells on one side of the organ, it bends more or less, the flaccid side becoming concave, and the leaf-blade is carried through a considerable arc. In the sensitive plants (*Mimosa*) of the tropics, contact is the usual stimulus. The whole reaction takes place very rapidly, the time from shock to response being only a fraction of a second. In

other plants variations in the intensity of light cause similar but slow curvatures in the motor organs. Exactly how the exudation of water from the cells of the motor organ is brought

FIG. 2. LONGITUDINAL SECTION THROUGH MOTOR ORGAN OF SENSITIVE PLANT (*Mimosa pudica*).

about is not known. It is probable that the stimulus in some way alters the physical structure of the protoplasm within the affected cells so that the contained solution is allowed to filter out. See MOVEMENT.

MOTRIL, mò-trèl'. A city and port of entry in Southern Spain, in the Province of Granada, situated on the Mediterranean coast, 32 miles south by east of Granada (Map: Spain, D 4). There are ruins of old Moorish fortifications, but the greater part is well built with modern houses. Motril is chiefly an industrial town, has iron foundries, and manufactures sugar, spirits, chocolate, flour, soap, paper, cotton textiles, and pottery. The harbor is an exposed roadstead. Population, in 1900, 18,508.

MOTT, JAMES (1788-1868). An American abolitionist, born at Cowneck, Long Island. Soon after completing his education he became a teacher in a Friends' boarding-school in Dutchess County, N. Y., where he met Lucretia Coffin (see MOTT, LUCRETIA), whom he afterwards married. In 1810 he removed to Philadelphia and became a merchant. He early manifested his sympathy with the anti-slavery movement and was one of the first supporters of William Lloyd Garrison. He was one of the organizers of the Philadelphia National Anti-Slavery Society in 1833, and in 1840 he was a delegate to the World's Anti-Slavery Convention in London. There he took a prominent part in the agitation to admit women delegates, and eight years later presided over the first national convention held in support of the woman's rights movement. In 1848 he joined in calling the Anti-Sabbath Convention, and after the war was actively interested in the establishment of Swarthmore College by the Philadelphia Yearly Meeting, of which he was a member.

MOTT, LUCRETIA (COFFIN) (1793-1880). An American abolitionist and woman's rights advocate, born on Nantucket Island. She was educated in the Friends' School at Nine Partners, near Poughkeepsie, N. Y., where she met James Mott (q.v.), whom in 1818 she married. She became prominent as a preacher in the Society of Friends and was chosen a minister. As a result of a visit to Virginia in 1818 she became an ardent advocate of emancipation. At the 'Separation' of 1827 which divided the Society of Friends

into two hostile factions, she and her husband adhered to the liberal or Hicksite party. In 1833 she attended as an invited guest the first convention of the American Anti-Slavery Society, of which her husband was a member. Soon afterwards she helped to organize the Female Anti-Slavery Society, of which she continued one of the leaders until 1839, when it was merged in the men's organization. As the feeling against abolitionists grew in intensity, many of the more timid Quakers began to deprecate any discussion of slavery by one of their ministers, and even in her own meeting she was regarded with suspicion and dislike. In 1840, at the World's Anti-Slavery Convention in London, to which both James and Lucretia Mott had been chosen delegates, the question of the equal participation of women in the proceedings of the convention came up, and after some discussion all women were excluded. It was then that Lucretia Mott and Elizabeth Cady Stanton first discussed the woman's rights movement, which they launched eight years later at a convention in Seneca Falls, N. Y. But these two movements, abolition and woman's rights, while they received the greater share of her attention, were not the only ones in which Mrs. Mott was interested, for all that promised to uplift humanity or to break the fetters of ignorance and tradition received her warmest support. Almost to the end of her life she made frequent journeys to visit distant meetings or to attend conventions called to consider the elevation of woman, the promotion of temperance, and the establishment of universal peace. Consult Hallowell, *The Life and Letters of James and Lucretia Mott* (Boston, 1884).

MOTT, VALENTINE (1785-1865). An American surgeon, born at Glen Cove, N. Y. He studied medicine at Columbia College, and graduated in 1806, taking post-graduate courses in London and Edinburgh. In 1809 he was appointed to fill the chair of surgery at Columbia College, in which position he was continued after the medical department of that institution was united with the College of Physicians and Surgeons in 1813. In 1826 he was one of the founders of the Rutgers Medical College, which was disbanded four years later. He then returned to the College of Physicians and Surgeons, and in 1830 became professor of surgery at the New York University Medical College. Mott was celebrated as a skillful operator in all branches of surgery, and was the inventor of several valuable surgical instruments. He introduced an operation for immobility of the lower jaw, and in 1821 performed the first operation for osteosarcoma of that member. He performed the operation of lithotomy 165 times and amputated more than 1000 limbs. He visited Europe in 1835 and traveled in the East, publishing an account of his journey in 1842. He published also a translation of Velpéau's *Operative Surgery* and a volume of clinical lectures (1860). Many foreign distinctions were conferred on him, and he was a member of many learned societies. He died in New York.

MOTTARONE, mòt'tà-rò'nà, MOUNT. A mountain in Italy on the west shore of Lake Maggiore (q.v.). It is 4892 feet high and is often called the 'Rigi of North Italy.' The view is magnificently extended. At one's feet lie Maggiore and six other lakes; across Maggiore,

60 miles to the southeast, may be seen the Cathedral of Milan; to the north rise the Alps.

MOTTEUX, mò'tě, PETER ANTHONY (1660-1718). A French-English playwright and translator, born at Rouen, in Normandy. He went to London on the revocation of the Edict of Nantes in 1685, and afterwards opened a warehouse in Leadenhall Street, where he sold 'tea, china, and Indian wares' (described in the *Spectator* No. 552). In 1693 appeared Boileau's, *Ode sur la prise de Namur, avec une parodie de la même ode par le Sieur P. Motteux*. Motteux mastered English in eight years; and in 1694 appeared one of the two works which made him famous. With Sir Thomas Urquhart and others he published in three volumes a translation of Rabelais (books i.-iii.), the remainder of which followed in 1768 (books iv.-v.). For the stage he wrote comedies, masques, and operas. But his fame rests wholly on his Rabelais and on his admirable version of *Don Quixote*. Motteux died on February 18, 1718, his birthday anniversary, in a brothel near Saint Clement's Church. Though several persons were held for his murder, it is more likely that he died of disease.

MOTT HAVEN. Formerly a village in Westchester County, N. Y., lying north of the Harlem River, and now included in New York City.

MOTTL, mòt'l, FELIX (1856—). An Austrian composer and musical conductor, born in Vienna. He studied at the Conservatory there under the best teachers, and won a number of prizes. In 1881 he became Court chapel-master at Karlsruhe, and conducted the philharmonic concerts till 1892. In 1886 he conducted at Bayreuth and in 1893 he was appointed general musical director at Karlsruhe. His most noteworthy undertaking was the initial production at Karlsruhe of Berlioz's great two-part opera, *Les Troyens*. His own operas, *Agnes Bernauer* (1880) and *Fürst und Sänger* (1893), were also successfully presented. His songs and minor compositions are relatively unimportant.

MOTTO (It., a saying). In heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge. Mottoes were originally the battle-cries of the knights who used them. They were attached to the badge when the family had one, or to the crest where there was no badge. See the article HERALDRY.

MOTUCA (mò-tso'kà) FLY. A gad-fly (q.v.) which abounds in parts of Brazil, and makes in biting a large and deep cut which may bleed considerably. As this fly (*Hadrus lepidotus*) sometimes settles in numbers on human beings, it is deservedly feared.

MOUBATA BUG. See MITE.

MOUCHERON, mò'sh'ron', FREDERIK DE (1634-86). A Dutch landscape painter, born at Edam. He studied under Jan Asselyn at Amsterdam, and then went to Paris. Afterwards he lived at Antwerp, and in 1659 settled at Amsterdam. His landscapes are mainly views in Italy—which he never visited—with figures by Lingelbach, Van der Velde, and Helmbreker. His son and pupil, ISAAC (1670-1744), was born at Amsterdam. He was an excellent engraver. The works of both these artists are to be found in many of the European galleries.

MOUCHEZ, mōō'shā', AMÉDÉE (1821-92). A French astronomer, born at Madrid. He studied in the French Naval Academy and served in the navy until 1878, when he succeeded Leverrier as head of the National Observatory. He had already shown himself an able and industrious scientist in the coast surveys of Brazil and Algeria, and as organizer of the expedition to the island of Saint Paul to observe the transit of Venus in 1874. In his new post he greatly improved the equipment of the observatory, brought out a score of volumes of the *Annales* and a part of the catalogues listing all stars observed since 1838, and, above all, planned the international photographic chart of the heavens. He wrote: *Côtes du Brésil* (1869-76); *Rio de la Plata* (1873); and *La photographie astronomique et la carte du ciel* (1877).

MOUFLON, mōōf'lōn (Fr.). A wild sheep (*Ovis musimon*), now, and perhaps always, restricted to the islands of Corsica and Sardinia, where it is confined to the highest parts of the mountains. The rams stand about 27 inches high at the shoulders, carry immense horns, and have an abundant mane about the neck, shoulders, and breast. This mane is ashy gray, but the body is rusty red, lighter on the sides and stern, and with a dark line along the spine. The belly, sides of the tail, feet, and nose are white. The females are more dun-colored, so that they are almost invisible among the rocks. During the winter flocks of several hundred formerly gathered and ranged the mountains until spring, when they separated into family parties of three or four ewes and lambs, led by an old ram; but now large flocks are uncommon. The rutting season is in midwinter; the lambs—one or two at a birth—are produced in April or May. The animals have now become very wary, and offer most excellent sport to hunters. Consult books of European natural history and sport, especially Afialo, *Sport in Europe* (London, 1901).

The term is sometimes extended to the aoudad (q.v.), and more especially to a slightly smaller sheep (*Ovis ophion*), with lighter horns, which is confined to the mountains of Cyprus, and called the Cyprian mouflon.

MOUKDEN, mōōk-dēn'. The capital of Manchuria. See MUKDEN.

MOULDING. See MOLDING.

MOULIN ROUGE, mōō'lān' rōōzh (Fr., Red Mill). A well-known dance hall on the right bank of the Seine in Paris, which since the disappearance of the Jardin Mabille has been one of the chief places of popular amusement.

MOULINS, mōō'lān'. The capital of the Department of Allier, France, 50 miles by rail northeast of Montluçon; on the Allier, here spanned by a bridge one-fourth of a mile long, with thirteen arches (Map: France, K 5). It is a well-built town, with pleasant, beautifully shaded, promenades and many places of interest. The chief among these last are the Hôtel de Ville, with a magnificent library and valuable manuscripts; the Cathedral and its interesting art treasures; the Archæological Museum, the Church of the Sacred Heart, and the Lycée. The industries comprise the manufacture of glassware, cotton and woolen fabrics, and silk; there is an important trade in coal, wood, grain, and wine. Moulins was for a time the capital of Bour-

bonnais and the residence of the dukes of Bourbon; of the ducal castle, a fourteenth-century tower, now used as a prison, remains. Population, in 1901, 22,340.

MOULMEIN, moul-mīn'. A city in Lower Burma. See MAULMAIN.

MOULTING. See MOLTING.

MOULTON, mōl'ton, ELLEN LOUISE (CHANDLER) (1835—). An American poet, born in Pomfret, Conn., April 10, 1835. She was educated at Troy, N. Y., and before her twentieth year had edited *The Waverley Garland, a Present for All Seasons* (1853), and had written *This, That, and the Other* (1854). In 1855 she married William Moulton, a Boston publisher and journalist. Her published work is voluminous. The following titles may be named: *Juno Clifford, A Tale* (1856); *My Third Book, A Collection of Tales* (1859); *Bedtime Stories* (1873); *More Bedtime Stories* (1874); *Poems* (1878); *New Bedtime Stories* (1880); *Random Rambles* (1881); *Ourselves and Our Neighbors* (1887); *Miss Eyre from Boston, and Others* (1889); *In the Garden of Dreams: Lyrics and Sonnets* (1889); *Stories Told by Twilight* (1890); and *At the Wind's Will* (1899). She was the literary executrix of the English poet Philip Bourke Marston, and collected his poems in 1892. In 1894 she published a volume of selected poems of Arthur O'Shaughnessy. Mrs. Moulton ranks well as a sonneteer and shows skill.

MOULTON, RICHARD GREEN (1849—). An English educator and literary critic, born at Preston, England, and educated at Christ's College, Cambridge. He was university extension lecturer to Cambridge (1874-90), to the American Society for the Extension of University Teaching (1890-91), and to the London Society (1891-92), and in 1892 became professor of literature in English at the University of Chicago. His works include: *Shakespeare as a Dramatic Artist* (1885); *The Ancient Classical Drama* (1890); *Four Years of Novel Reading* (1895); *The Literary Study of the Bible* (1896); and *Introduction to the Literature of the Bible* (1901); the last two supplementary to *The Modern Reader's Bible* (1895-98), published under his editorial care.

MOULTRIE, mōl'trī, FORT. See FORT MOULTRIE.

MOULTRIE, WILLIAM (1731-1805). An American soldier, prominent in the Revolutionary War. He was born in South Carolina, received an ordinary education, and in the Cherokee troubles of 1761 was a military captain. Though closely connected with many of the Loyalists, he early took sides with the Patriot Party. In 1775 he was the representative of Saint Helena Parish in the South Carolina Provincial Congress, and later in the same year was chosen colonel of a South Carolina regiment. For some time thereafter he was busily engaged in providing for the defense of Charleston, and to this end placed a battery at Haddrell's Point and (March, 1776) began the erection of a rude fort of palmetto logs on Sullivan's Island. This fort commanded the entrance to the harbor, and on June 28th was fiercely but unsuccessfully attacked by Admiral Sir Peter Parker, who was finally forced to withdraw. Moultrie had undertaken the defense against the advice and wish of his

MOUND-BUILDERS

MOUND, ADAMS COUNTY, OHIO

CIRCULAR EARTHWORK, OHIO

superior officer, General Charles Lee. For his success he received the thanks of Congress, and in his honor the fort was named Fort Moultrie. In September of the same year he was made a brigadier-general and was put in command of the Department of Georgia and South Carolina. He defeated the British under General Gardner at Beaufort in February, 1779, and, by obstructing the advance of Prevost in May, enabled Charleston to prepare for its defense, finally entering the city and holding chief command until the arrival of General Lincoln. On the surrender of Charleston in May, 1780, he became a prisoner, but in February, 1782, he, with several others, was exchanged for Burgoyne. He was made a major-general in October of that year, and subsequently was twice (in 1785 and in 1794) elected Governor of South Carolina. He retired to private life after his second term and died at Charleston, September 27, 1805. His *Memoirs of the Revolution as far as it related to the States of North and South Carolina* (2 vols., 1802) was written in part while he was a prisoner, and was finished in later years.

MOUND-BIRD. The mound-birds are a group of gallinaceous birds, with feet like those of pigeons in not having the hallux raised above the other toes, and related to the American curassows (q.v.). They form a family, the Megapodidae, which, as is indicated by the name, are characterized by the possession of unusually large feet. Although the family contains two subfamilies, the mound-birds proper or, as they are called in Australia, 'jungle-fowl,' and the brush turkeys (q.v.), yet all these birds agree in the remarkable habit which has given them their widely known popular name. This habit is the building of a huge mound for a nest, within which the eggs are left to be hatched by heat caused by the decay of vegetable matter within the heap. These mounds vary greatly in size and shape as well as in manner of construction, and in the number and arrangement of the eggs which they contain. The simplest are where the birds excavate a hole in the sand in which the eggs are laid, and are then covered with a mixture of sand and vegetable matter. Such is the habit of the 'lowan,' or 'mallee-bird' (*Megacephalon maleo*), of Celebes. In most cases, however, the birds scratch up grass, leaves, turf, etc., and with their large feet throw this material together in a heap. The female digs down into such a heap from the top and lays an egg, which is so placed that it is nearer the outside than the top of the mound. Just how the young escape from the mound when the egg hatches is still uncertain, but it is probably by digging through to the side. The young are well developed, feathered, and able to fly as soon as they leave the mound. The number of eggs laid by each female is still a matter of doubt; from four to twenty are found in each mound, and there is no doubt that several females often lay in the same heap. The eggs are white when first laid, but soon become stained by the vegetable matter in which they lie. They are remarkably large for the size of the bird and are ellipsoidal rather than oval; they measure from 3 to 4.3 inches in length, according to the species. The birds resort to the same mound season after season, but add fresh material at every egg-laying time. Consequently the mounds increase with age and

may be in use for many years. They are usually more or less truncatedly conical or crater-like in form, but may have one of the horizontal diameters much longer than the others. The largest one on record was reported to be about 50 feet in diameter and some 14 feet high.

The mound-birds themselves are plainly colored and vary in size from a small fowl to a small turkey. They are shy and retiring and are not often seen. They frequent scrub and undergrowth along the seacoast or on the banks of streams emptying into the sea. The mounds are built in open spaces in the thick scrub or on unfrequented parts of the shore. The birds fly little and heavily, and are not easily flushed, but sometimes seek shelter in trees. They are said to be noisy at night and to have hoarse call-notes which they use during the day. All the Megapodidae are inhabitants of the Australasian region and are not found north of Celebes; the majority of the species are Australian. The one best known on that continent is the 'scrub-hen,' or 'mound-turkey,' of Queensland (*Megapodius tumulus*). Another smaller one is the leipoa (*Leipoa acellata*). The 'brush-turkeys' of New Guinea and neighboring islands belong to the genus *Tallegalus*.

Consult Gould and other authorities on the ornithology of Australia (see BIRD). See, also, Campbell, "Mound-Building Birds" (with photographic illustrations of 'mounds'), in *Bird Lore*, vol. v. (New York, 1903).

MOUND-BUILDERS. Specifically, a hypothetical race or people at one time supposed to have antedated the Indian tribes as inhabitants of the Ohio and Mississippi valleys; but the 'Mound-Builders' of the Mississippi Valley are now regarded merely as the ancestors and representatives of the tribes found in the same region by Spanish, French, and English pioneers. The custom of erecting mounds has been widespread; most primitive peoples are known to have erected mounds either habitually or in some stage of their development. Most of the mounds of the typical regions in Central North America are mortuary or sacrificial. The chief contents are skeletons, with ceremonial and other objects buried with the bodies, while the structures are wholly of earth; in a few cases house-like structures form the nucleus of the mound. In the Southwestern United States, in Central America, and elsewhere in the Western Hemisphere, as in the Old World, the mounds are sometimes crumbled ruins of structures of adobe, or sun-dried brick.

MOUND CITY. The county-seat of Pulaski County, Ill., eight miles north of Cairo; on the Ohio River, and on the Cleveland, Cincinnati, Chicago and Saint Louis Railroad and a branch of the Illinois Central (Map: Illinois, C 6). It has a trade in lumber, ship-building interests, and manufactures of lumber, staves, furniture, pumps, etc. In the national cemetery here are 5310 graves, 2732 of unknown dead. Population, in 1900, 2705.

MOUNDSVILLE. A city, named in honor of its most striking attraction, and the county-seat of Marshall County, W. Va., 11 miles south of Wheeling; on the Ohio River, and on the Baltimore and Ohio and the Ohio River railroads (Map: West Virginia, D 2). It is the seat of

the State penitentiary, and has a fine court house, and a famous relic of the mound-builders, a massive structure of conical form, in which two burial vaults containing skeletons and copper ornaments were discovered by excavations of 1838. The city is in an agricultural and coal-mining region, has important commercial interests as a result of its shipping facilities, and extensively manufactures glass, lumber products, enameled ware, bricks, cigars, grain cradles, flour and feed, foundry products, leather, etc. The government is vested in a mayor, elected every two years, and a unicameral council. Population, in 1890, 2688; in 1900, 5362.

MOUNET-SULLY, mō'nā'su'lē' (1841-). A French tragedian, whose real name is Jean Sully Mounet. He was born at Bergerac, February 27, 1841, and at twenty-one entered the Conservatoire. After beginning his career at the Odéon, he served in the Franco-Prussian War, and in 1872 he made his début at the Théâtre Français, where in about two years he became a member of the company. Admirably gifted by nature, he is famous for the power and passion of some of his impersonations. His successes include many of the rôles in the classic repertoire. Among them are his Achilles in *Iphigénie* and his Hippolyte in *Phèdre*, and also characters in more modern works like those of Victor Hugo. Perhaps his most notable achievement, however, was his performance of *Edipus the King* in the fêtes at the old Roman Theatre of Orange, a performance repeated in Paris at the Théâtre Français (1888). His Hamlet also counts among his most serious efforts. Consult Matthews, *The Theatres of Paris* (New York, 1880).

MOUNIER, mō'nyā', JEAN JOSEPH (1758-1806). A French politician and author, born in Grenoble (Isère). He became judge at Grenoble in 1783, secretary of the estates of Dauphiné in 1788, and in 1789 was elected Deputy in the States-General. There he unsuccessfully advocated the system of two legislative chambers, a subject which he also expounded in his *Considérations sur les gouvernements* (1789). He was elected president of the National Assembly in 1789, but soon afterwards resigned because of the decision to remove the Assembly to Paris. He withdrew to Switzerland and thence to Weimar, published his *De l'influence attribuée aux philosophes, aux francs-maçons et aux illuminés sur la révolution de la France* (1801), and in 1801 returned to France, where Bonaparte appointed him prefect of Ille-et-Vilaine (1802) and counselor of State (1805). His further publications include *Recherches sur les causes qui ont empêché les Français de devenir libres* (1794). Consult De Lanzac de Laborie, *Un royaliste libéral en 1789* (Paris, 1887).

MOUNT FOR GUNS. See COAST ARTILLERY; GUNS, NAVAL; ORDNANCE.

MOUNT, WILLIAM SIDNEY (1807-68). An American genre and portrait painter. He was born at Setauket, Long Island, November 26, 1807, and studied at the National Academy, New York, of which he was made a member in 1832. His first works to gain repute were the "Daughter of Jairus," exhibited in 1828, a full length portrait of Bishop Onderdonk, and a number of clever children portraits. It was not until the exhibition of "Husking Corn" that his special

talent for genre painting was recognized. Mount was the forerunner of a whole school of genre artists; he had a keen eye for humor, and was one of the first Americans to portray the negro character successfully. Among his best paintings are: "Bargaining for a Horse," "The Fortune-Teller," and a portrait of James Rivington, in the New York Historical Society; "Raffling for a Goose" (1837), Metropolitan Museum, New York; "A Long Story" (1837), Corcoran Gallery, Washington; "Turn of the Leaf," Lenox Library, New York. Mount died at his home in Long Island, November 19, 1868.

MOUNTAIN (OF. *montaigne*, *montaigne*, Fr. *montagne*, from ML. *montanea*, *montana*, mountain, from Lat. *montanus*, mountainous, from *mons*, mount). A term somewhat loosely used for a high prominence on the earth's surface with steep slopes. The distinction between mountain and hill is merely one of size. A plateau is distinguished from a mountain by its broader top and sometimes by its gentler slopes. Where a mountain forms a linear elevation it is called a range, ridge, chain, or sierra. Where the ridges are grouped in parallel lines, or *en échelon*, the groups are called mountain chains, systems, or cordilleras. These terms are sometimes given more precise meanings. *Mountain ridge* is sometimes confined to a series of parallel ranges, all of which were formed within a single geosyncline, or on its borders. *Mountain system* is applied to a number of parallel or consecutive ranges formed in separate geosynclines of approximately similar dates of upheaval. *Mountain chain* is applied to two or more systems of the same general region of elevation, but of different dates of origin. *Cordillera* is applied to several mountain chains in the same part of the continent. Most of the names applied to parts of mountains explain themselves. Crest, peak, knob, pinnacle, needle, valley are familiar to all. A gorge or cañon or clove is distinguished from a valley by its steep slopes and narrow bottom; a park is a broad valley; a col or saddle is an exceptionally low point in a crest; a cirque is a steeply walled, outward facing amphitheatre near the crest of the range.

TYPES AND ORIGIN OF MOUNTAINS. Mountains are formed (1) by uplift, (2) by circumdenudation or land sculpture, and (3) by eruptive agencies; and mountains formed in these three ways have characteristic and distinguishing forms.

FAN STRUCTURE, ALPS.

(1) By far the larger number of mountains due to uplift are in the form of folds or wrinkles in the earth's crust. These folds take on a great variety of form and arrangement. Usually a number are parallel, but not coextensive in their longer directions, lapping by one another *en échelon*. They may be upright or overturned at various angles. They may be compressed

along the limbs and spread out at the crest in such a way that the strata on both sides of the axial plane of the fold dip toward this plane, a type of folding called the *fan fold*, sometimes the *Alpine structure*, because of its excellent development in the Alps. On the major folds with this variety of attitude may be imposed smaller folds, just as smaller waves are superimposed on the greater waves of a body of water. Again, the folds are themselves folded in directions transverse to their longer directions. Examples of mountain systems representing folds of the earth's crust are the Alps, the Jura, the Appalachian system, the Coast Ranges, and most of the Rocky Mountains.

SYMMETRICAL FOLD, JURA MOUNTAINS.

Another type of uplift is shown in the Basin Ranges of Nevada, Idaho, Arizona, and New Mexico, and is known as the *Basin Range structure*. Here the uplift is not accompanied by any horizontal compression. The rocks apparently have been uplifted vertically in great blocks owing their outlines to joints or faults, while others remain stationary or go down. Not infre-

FAULTED STRUCTURE, BASIN RANGE.

quently a series of such blocks is tilted in a monoclinical manner, corresponding edges of different blocks going up and the opposite edges going down, the elevated edges thus making mountains, and the depressed edges making valleys.

Still another type of uplift is shown in the Uinta Mountains of Utah, where a great mass of rock has been apparently lifted vertically above the adjacent rocks with only a gentle arching.

BROAD MONOCLINE, UINTA MOUNTAINS.

Two theories have been proposed to explain mountains of the fold type, the so-called gravitation theory, and the contraction theory. It has been observed that mountains formed by folding or faulting are for the most part composed of great thicknesses of sediments which were deposited in the same general geosyncline, i.e. in the same great depression of the earth, or perhaps which were deposited in areas which became geosynclines due to subsidence of the area under the weight of the sediments. It is supposed that the load of sediments may cause the isogeotherms to rise, that is, causing the rocks at a certain level to have a higher temperature than they otherwise would have. This, perhaps combined with the injection of igneous rocks, which are sometimes observed to occur in such areas, causes the rocks to expand, resulting in folds or mountains. To this there are a number of objections. The expansion possible by this cause

is not sufficient to explain the amount of folding observed, and furthermore it does not explain the occurrence of the folds in parallel ridges. The contraction theory is briefly this: The cooling of the earth is proceeding more rapidly in the interior than at the cool exterior. This causes more rapid contraction of the interior than of the exterior, and the crust, in its tendency to make itself smaller in order to fit the smaller nucleus, becomes wrinkled and corrugated. The wrinkles become located along points of weakness. These are likely to be under the geosynclines where great sedimentation has occurred, where, as above seen, the temperature is supposed to be higher.

(2) When an area is elevated above the sea the natural forces of erosion, wind, water, changes of temperature, etc., begin their attack upon the land, and slowly cut it down, the waters collecting in rills, brooks, and rivers, cutting small and large valleys with a variety of forms and distribution due to the varying hardness and the structure of the materials cut through. If carried far enough this process will ultimately bring the elevated area to sea level. At certain stages in the process certain areas, because of their hardness or structure, may stand high above the surrounding areas which have been worn away, and may be called mountains. In so far as mountains have already been formed by folding and elevation, subsequent erosion only modifies their shapes, but where uplift has not left the land in mountain form subsequent denudation may bring it to this point. Mountains formed or modified in this way have a variety of shapes. When the strata are horizontal a hard layer at the top may resist erosion sufficiently long to make the mountain a flat or table top mountain. Hard volcanic material about a volcano may resist erosion more than the surrounding material, and the area thus stand as a lava-topped mountain. If the strata are much folded erosion cuts down along lines of least resistance, usually following the softer strata, leaving the edges of the harder ones as ridges. This state of affairs appears in the Appalachian system, a system owing its present features to folding and elevation combined with differential denudation along softer layers.

(3) Mountains formed by eruption of igneous rocks are of common occurrence. Volcanic mountains formed by lavas occurring either singly or grouped in lines are well known. Vesuvius, Rainier, Hood, Saint Helen's, and Shasta are examples of these. The volcanic materials may be so grouped as to form an upland of considerable extent, as the Cascade range. Eruptions of igneous rocks which never reach the surface also form mountains by bulging up the strata above them. Going upward toward the surface they find it easier at a certain point to spread out in a globular form (called laccolite), arching the strata above them, than to break through the overlying strata and come to the surface. The mountain thus formed is a dome with a nucleus of igneous material. The Henry and Huerfano mountains of the Western United States are of this type.

MOUNTAINS AND CLIMATE. Mountains fulfill important uses in the economy of nature, especially in connection with the water system of the world. They are at once the great collectors

and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain ranges intersect the course of constant winds and abstract the moisture, they produce a moist country on the windward side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plain; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable barrier if the temperate regions contained as lofty mountains as the tropics. Mountains also show considerable vertical variation in their life and climate zones. It is well known that, other things being equal, the air is one degree cooler for every 300 feet of ascent, and also that the rate of precipitation increases upward. At a certain elevation rain gives way to snow. Corresponding to these varying conditions of temperature and moisture is the distribution of the vegetation, which is commonly in well-defined zones, each zone distinguished by its species from the zones above and below. Near the top of many mountains the vegetation ends altogether, and the top of the mountain is barren.

AGE OF MOUNTAINS. The age of most folded mountain systems has been determined by the structure of the sediments of known age which compose them, and their relation to other sediments of known age. For instance, the Appalachian system of the Eastern United States, composed mainly of Paleozoic rocks, is much contorted, while rocks of Mesozoic age rest against this mountain system in relatively undisturbed layers. It is clear that the main uplift of the mountain system followed the deposition of the Paleozoic rocks, and preceded that of the Mesozoic rocks. The age of volcanic mountains is determined by the relations of the volcanic materials of surrounding sedimentary rocks of known age. The mountain systems of the world were formed at various times. Some of them have represented areas of weakness where several mountain-making movements have occurred, as in the Pyrenees, Alps, Jura, and Himalayas. Others have been cut down by denudation to their very roots, and do not now appear as mountains. The greatest and loftiest mountains of elevation have for the most part received their greatest uplift in comparatively recent geological times.

MOUNTAIN, THE. The name of a political faction in the French Revolution. See MONTAGNARDS.

MOUNTAIN ARTILLERY. Cannon for use in countries where the usual wheeled vehicles cannot go. Sometimes a jointed gun of considerable weight, as in the case of the English, sometimes a single piece gun—designed to be capable of being taken wherever troops may be ordered without retarding their movements. Fixed ammunition with metallic cartridge cases is used entirely.

In the United States the mountain guns are of two forms: The Hotchkiss 2-pounder, 1.65 in. calibre, and the Hotchkiss 12-pounder, 3 in. calibre. The carriage is of steel. The cartridge consists of three main portions: the cartridge case, the charge, and the projectile. Two types of projectile are used, canister and shell. The canister for the 2-pounder consists of a cylindrical tin case holding 30 hardened-lead one-ounce bullets with the interstices filled with a matrix of sulphur. The shell is of cast iron, with point percussion fuze. (See FUZE.) The 2-pounder gun weighs 121 pounds and is capable of penetrating 1.3 inches of steel at the muzzle. The 12-pounder gun weighs 218 pounds and is capable of penetrating 1.4 inches of steel at the muzzle. The English mountain gun, which is of great importance in the Indian and colonial service, is a jointed weapon of three pieces, each section weighing 960 pounds, the entire gun and carriage weighing 5160 pounds.

MOUNTAIN ASH, ROWAN TREE, or QUICKEN TREE (*Pyrus Aucuparia*; *Sorbus Aucuparia* of many botanists). A very ornamental European tree of the natural order Rosaceæ. It does not attain a great size; has in general a very straight erect stem; and is distinguished from the other species of *Pyrus* by pinnated glabrous leaves of

MOUNTAIN ASH.

serrated leaflets, terminated by a single leaflet; corymbs of small flowers; and small globose fruit. The wood is valued for its compactness. The inner bark and sapwood have a very peculiar smell. In the superstitions of European peasants a twig of rowan tree was supposed to have great efficacy in scaring away evil spirits. The

generally red, sometimes yellow, fruit (rowan berries), which is acid and somewhat bitter, is sometimes used for preserves. The very nearly allied American species (*Pyrus Americana*), which has bright red fruit, is a shrub or small tree distributed from Newfoundland to Manitoba and southward in elevated regions, and often planted as an ornamental. The wood is soft, light, and little used. Somewhat similar to it is the elder-leaved mountain ash (*Pyrus sambucifolia*), a hardy species ranging north to Greenland and Alaska, but seldom found south of the Great Lake region. It differs from *Pyrus Americana* in its leaves, larger flowers, and fruits.

MOUNTAIN ASH. A coal-mining town in Glamorganshire, Wales, five miles south of Merthyr-Tydfil (Map: Wales, C 5). It has large collieries, foundries, and iron manufactures, owns its water and gas works, and maintains slaughter-houses. Population, in 1891, 17,826; in 1901, 31,100.

MOUNTAIN BEAVER. The sewellel (q.v.).

MOUNTAIN CAT. (1) In California, the catomistle. (2) Any of several wild cats regarded as peculiar to local mountain regions; a catamount.

MOUNTAIN CHAIN. See MOUNTAIN.

MOUNTAIN CLIMBING. The awakening of man's interest in mountains is chiefly due to Rousseau, though earlier writers, while approaching them as scientists, were also susceptible to their charm. This two-fold interest led Saussure to incite J. Balmat to find a way to the summit of Mont Blanc in 1786 and to accompany him thither in 1787. From that ascent alpinism is generally dated. In London in 1857 was formed the first Alpine Club to foster "the community of feeling amongst those who in the life

of the High Alps have shared the same enjoyments, the same labours, and the same dangers." This idea, in a modified form, was taken up throughout Continental Europe and advocated with such enthusiasm that more than 100,000 persons of both sexes are now enrolled in the various alpine societies. The largest of these are the German and Austrian (founded in 1862), about 55,000 members; Swiss (1863), 7000; Italian (1863), 54,000; and French (1874), 6000. In America three strong societies came into being: the Appalachian Mountain Club (q.v.) in Boston (1876), 1300 members; the Sierra Club (1892) in San Francisco, 800; and the 'Mazamas' (1894) in Portland, Ore. In these derivative societies eligibility is based upon a love of nature and of the mountain in particular rather than on alpinism proper, though most of them contain a contingent of expert climbers. The American Alpine Club (1902), with its home in Philadelphia, aims to revert to the original type, but adds to its field polar exploration and the study of glaciers.

Thus cultivated, Alpine climbing has attained almost to a science. Its principles are set forth in extended manuals, such as Dent's *Mountaineering*, Badminton Library (London, 1892). It has called into existence the class of professional guides—Swiss, Tyrolese, and Italian—whose skill far exceeds that of the best amateurs. Their aid, always expedient in tours above snow line, is indispensable in attacks upon giant peaks in distant lands, such as have frequently been made within recent times.

The most dangerous accidents in mountain climbing, those which consist in falls from a great height, rarely occur when guides are taken and the party is properly roped together in a chain of mutual support. Occasionally some foothold seemingly secure gives way beneath the climber's weight; but more frequently the

* The first snow peak. † The highest in range. ‡ The highest summit.
(In most instances the guides are not mentioned in this list.)

§ The highest thus far climbed.

fall takes place because the climber is overtired, or has started too quickly, without the necessary training and hardening, in consequence of which at a critical moment some muscle fails to answer. Overexertion of either body or mind is always to be avoided; for alertness of both is essential. The rope is the sheet anchor of mountaineering, whether it be on the snow or on the equally dangerous grassy slopes. On really difficult mountains no more than three persons should be on the same rope. With the rope the ice-axe is used, and indeed is a very necessary adjunct to the climber. It consists of a steel axe with a cutting edge crosswise to the handle, like an adze and a pick. The handle is of such length that it makes a convenient staff, and is shod with a steel point. The cutting edge of the axe is employed for making steps in an ice wall, the pick for holding and aiding the climber in pulling himself up, while the axe when used as a staff or alpenstock enables the climber to hold securely, or it can be employed as a brake when descending. Accidents which come from the fall of large masses of rock, snow, or earth may be largely obviated by a careful observation of the position of the sun with regard to snowfields below upon which the path is to be taken. If the snow begins to slide, carrying the climber with it, the utmost nimbleness of resource, wit, and strength applied to the alpenstock as a brake is the only remedy that can be formulated beforehand. In ascending an ordinary *coulloir* the axe must be constantly used for cutting footholds step by step.

The list on the preceding page presents some of the principal first ascents since the earliest authentic records.

MOUNTAIN GAZELLE. See GAZELLE.

MOUNTAIN GOAT. See ROCKY MOUNTAIN WHITE GOAT.

MOUNTAIN HERRING. The Rocky Mountain whitefish (*Coregonus Williamsons*), found in clear streams from the northern Rocky Mountain ranges to the Pacific coast. It is good food, and is esteemed by anglers, as it readily takes a fly. See WHITEFISH; and Plate of WHITEFISH, SMELTS, ETC.

MOUNTAIN LIMESTONE. The basal strata of the Carboniferous series in the south of England and Wales. It is highly fossiliferous and carries a few ores. Its chief use is for building stone. The term was applied to the calcareous rocks of the American Subcarboniferous, but soon fell into disuse.

MOUNTAIN LION. The name in the western part of the United States for the panther, cougar, or puma (*Felis concolor*). Early writers upon America reported that the lion was a resident of North America from the skins they saw among the Indians, which they supposed to be those of lionesses. See PUMA.

MOUNTAIN MEADOWS MASSACRE.

In American history, the massacre, near Mountain Meadows in Utah, in September, 1857, of a party of emigrants from Arkansas and Missouri passing through Utah on their way to Southern California. They numbered all told about 140 men, women, and children. On their way they were everywhere refused food until they reached the neighborhood of Mountain Meadows, a valley in Iron County, about 350 miles south of Salt Lake City. Here they stopped to rest their horses, and on September 7, 1857, were fired upon by Indians, and, it is alleged, by Mormons disguised. They withstood siege until September 11th, when, on promise of protection by John D. Lee (q.v.), Mormon bishop and Indian agent, they left the shelter of their wagons. All adults and children over seven years of age were killed, and seventeen younger children were distributed among Mormon families, but were afterwards restored to relatives by the United States Government. Lee was executed for this crime in 1877, and though the effort to inculcate other high officers of the Church failed, there can be little doubt that the project was known and approved by them, especially since Brigham Young (q.v.) had a short time before announced that "no person shall be allowed to pass or repass into or through or from this territory without a permit from the proper officer." H. H. Bancroft in his *History of Utah* (San Francisco, 1883) places blame on Lee entirely. Consult: Linn, *Story of the Mormons* (New York, 1902); and *Confessions of John D. Lee* (Saint Louis, 1891).

MOUNTAIN MOCKING-BIRD. See MOCKING-BIRD.

MOUNTAIN PLANTS. The chief features of mountain plants have been discussed under the head of ALPINE PLANT. At the bases of most mountains the vegetation closely resembles that of the surrounding lowlands, but with elevation changes appear which correspond to the changes observed as the globe is traversed toward high latitudes. For example, in the mountains of Mexico the typical vegetation of the lowlands gives place with ascent to various zones of trees, including forms which are deciduous like those of the United States, then conifers like those of the Northern United States and Canada, and finally into mosses and lichens characteristic of the alpine regions. Mountains contain a large

proportion of endemic plants. This is doubtless due to their relative isolation. Mountain endemism is particularly characteristic of the alpine forms, probably because the conditions for their migration are less favorable than for those farther down. Some plants characteristic of mountain habitats are shown in the accompanying plate. See ENDEMISM.

MOUNTAIN PLOVER. A ring-plover (*Egialitis montana*), very common throughout the Rocky Mountain region and neighboring plains, where its sandy gray plumage renders it almost invisible when it alights. It remains in the open lands, and rarely ascends above the level (8000 to 9000 feet) of the interior 'parks.' It breeds throughout its summer habitat.

MOUNTAIN QUAIL. A local name of two Californian 'partridges': (1) the 'plumed' partridge (*Oreortyx pictus*); and (2) Gambel's partridge (*Lophortyx Gambeli*). See QUAIL.

MOUNTAIN SHEEP. The Rocky Mountain Sheep. See BIGHORN.

MOUNTAIN SPINACH. See ORACHE.

MOUNTAIN SYSTEM. A term rather loosely used, but which properly refers to a number of parallel or consecutive mountain ranges formed during the same geological period, but in separate areas of crusted folding. Thus the Appalachian system comprises the Appalachian, Acadian, and Ozark ranges, each of which follows a common direction although lying within a different geosynclinal fold.

MOUNTAIN TEA. See GAULTHERIA.

MOUNT AUBURN. A well-known cemetery in Cambridge, Mass., containing the graves of many celebrated men, including Longfellow, Lowell, Charles Sumner, and Phillips Brooks. The beautiful grounds cover 125 acres.

MOUNT AYR. A town and the county-seat of Ringgold County, Ia., 75 miles south by west of Des Moines; on the Chicago, Burlington, and Quincy Railroad (Map: Iowa, C 4). It has a fine court-house and public school buildings, and is important chiefly as a trade centre for a fertile agricultural and stock-raising section. Population, in 1890, 1265; in 1900, 1729.

MOUNT CARMEL. A mountain range of Palestine. See CARMEL.

MOUNT CARMEL. A city and the county-seat of Wabash County, Ill., 25 miles southwest of Vincennes, Ind.; on the Wabash River, and on the Southern and the Cleveland, Cincinnati, Chicago and Saint Louis railroads (Map: Illinois, E 5). It has a fine court-house and city hall. Water power is obtained from the river; and besides railroad shops of the Big Four, there are manufactories of machinery supplies, pulleys, shafting, paper, strawboard, lumber, spokes, staves, woodenware, furniture, and flour. Settled in 1818, Mount Carmel was chartered as a city in 1865. Population, in 1890, 3376; in 1900, 4311.

MOUNT CARMEL. A borough in Northumberland County, Pa., 28 miles east-southeast of Sunbury; on the Lehigh Valley, the Northern Central, and the Philadelphia and Reading railroads (Map: Pennsylvania, E 3). There are several anthracite mines here and in the vicinity, and an important coal trade is carried on. The borough has also manufactures of lumber, hats

and caps, miners' lamps, shirts, cigars, etc. Population, in 1890, 8254; in 1900, 13,179.

MOUNT CARROLL. A city and the county-seat of Carroll County, Ill., ten miles east of the Mississippi River; on the Chicago, Milwaukee and Saint Paul Railroad (Map: Illinois, B 1). It has a public high school library and the Frances Shimer Academy. There are valuable mineral deposits, especially iron ore, in the vicinity, which is interested mainly in agriculture and stock-raising. Population, in 1890, 1836; in 1900, 1965.

MOUNT CLEMENS. A city and the county-seat of Macomb County, Mich., 20 miles north-east of Detroit; on the Clinton River, at the head of navigation, and on the Grand Trunk Railroad (Map: Michigan, L 6). It is a popular summer and health resort, beautifully situated, and noted for its mineral springs, which possess curative properties for many diseases. The city has an active Chamber of Commerce, a public library, and well-equipped hotels and bath-houses. Its industrial interests are represented by a large beet-sugar factory, cooperage works, a casket manufactory, and an establishment producing carriages, wagons, sleighs, and agricultural implements. Settled in 1802, Mount Clemens was incorporated first in 1878. The government is administered, under the conventional charter of Michigan cities of the fourth class, by a mayor, annually elected, and a unicameral council. The city owns and operates the water-works. Population, in 1890, 4748; in 1900, 6576.

MOUNT DESERT, *dê-zêrt' or dêz'êrt.* The largest of the numerous islands on the coast of Maine. It belongs to Hancock County, and is separated from the mainland on the northwest by a channel from one-half to two miles wide, and on the northeast by Frenchman's Bay (Map: Maine, G 7). It is 15 miles long and 8 miles broad, with an area of about 100 square miles. Its outline is very irregular, a long, narrow bay or fiord almost separating the island into two halves. The surface is rugged and mountainous, rising to a height of over 1500 feet, and presenting a line of bold cliffs along the northeast coast. The island is surrounded by a number of rocky islets, and there are several beautiful lakes in the interior, giving a varied character to the scenery, which has made Mount Desert a favorite summer resort. The island has three convenient harbors, Bar Harbor, Northeast, and Southwest, and numerous villages, varying in popularity as summer resorts, the most noted being Bar Harbor. First discovered by Champlain, who gave the island its name, Mount Desert was settled in 1608 by French Jesuits, their colony of Saint Sauveur on Somes Sound, however, being destroyed eight years later by an expedition from Virginia. A permanent settlement here (Somesville, which is thus the oldest on the island) was effected by the English in 1761. The town of Mount Desert was incorporated in 1789. Since that date the towns of Eden, Cranberry Isles (three miles from Southwest Harbor), and Tremont have been formed from the original district and incorporated, respectively, in 1796, 1830, and 1848. Population, Cranberry Isles, in 1900, 374; Eden, in 1890, 1946; in 1900, 4379; Mount Desert, in 1900, 1600; Tremont, in 1900, 2010.

MOUNTED GRENADIERS. See **MOUNTED INFANTRY**.

MOUNTED INFANTRY. A general term applied to foot soldiers mounted on horses, mules, camels, or on wagons for transportation only. Such were the ancient infantry carried swiftly to the battlefield in war chariots. In the sixteenth century Louis of Nassau made 500 of his cavalymen take up behind their saddles an equal number of infantry, and Alexander of Parma, wishing to surprise the Duke of Alençon, mounted several companies of infantry on pack horses. This was followed by mounting several divisions of the infantry of that time, to which was given the name of 'dragoons,' probably from the matchlock carried, which was ornamented at the muzzle with the head of a dragon. Eventually this name 'dragon' was given to certain cavalry which fought either mounted or dismounted. Louis XIV. established a corps of 'Mounted Grenadiers.' James II. created a similar corps in the British Army, called 'Horse Grenadiers,' who were armed with muskets and grenades; in action they dismounted, linked horses, fired, and then threw their grenades by ranks. In 1780, during the American Revolution, a body of 1500 mounted riflemen from Kentucky and North Carolina, each man armed with his own rifle and mounted on his own horse, attacked the British at King's Mountain, and after a spirited dismounted contest defeated the enemy, who lost Major Ferguson killed, 300 others killed and wounded, and 800 men and a quantity of arms and ammunition captured. Napoleon in Egypt mounted a body of selected infantry on camels, as did forty years later the British in India, in which their camel-infantry covered forty miles daily for six days. Again, in the Sudan campaign camels were used with success. In Tongking and Algeria the French often mount their infantry, sometimes allotting one mule to two soldiers, by which plan they have accomplished 140 miles in three days. The best authorities agree that mounted infantry should be used for the sole purpose of moving quickly to the place where they are required for duty as infantrymen, not hesitating, if necessary, to sacrifice the means of transportation.

During the war in South Africa (1899-1902) the Boer army was almost entirely composed of mounted infantry or riflemen. These were men accustomed to the saddle and the use of firearms from boyhood, versed in the arts of the hunter, in the science of woodcraft, and familiar with the topography of the field of operations. Having, by cautious and noiseless approach, reached unperceived a spot near the enemy, the Boer dismounted, hopped his horse, leaving him a short distance in rear, crept forward, and from a secure position opened fire upon the unsuspecting foe. If forced to retire, he did so quietly and quickly to take up a new position. From impregnable natural fortifications small bodies of these mobile troops often repulsed vastly superior British forces supported by artillery. In operating against the British cavalry the Boers advanced toward it on horseback up to within 500 meters, then dismounted and opened fire. In battle the Boers left the reins thrown over their horses' necks and dragging on the ground; the horses did not move until their riders returned; these animals were of a

great variety of size and breed, from the stolid Basuto pony to the blooded stallion.

The British under Lord Roberts had a force of about 3000 mounted infantry, originally organized into two brigades of five regiments each; of which 2000 men were regulars and the remainder colonials. Owing to the want of instruction in mounted field duties, this force (with the exception of the colonial contingent) was not very useful.

During the American military operations in the Philippines small detachments of regular infantry mounted on active native ponies were found useful in expeditions where rapid marches were necessary during the rainy season or as a temporary substitute for cavalry.

In those European countries where large cavalry establishments are maintained and traditional methods are deeply rooted, there will be provision for three classes of mounted troops; one on large, heavy horses trained in 'shock tactics' and for ceremonial purposes; another on lighter horses for scouting and pursuit of an enemy; a third, of infantrymen armed with long-range rifles on small, active horses for escort, convoy, and picket duty. In the United States all of these duties are performed by a single class. To give greater mobility to infantry without impairing its fire action, it may be mounted temporarily on anything that will transport it rapidly to the place where it is needed in advance of its comrades on foot; this kind of mounted infantry must be employed in masses, never individually.

MOUNTED POLICE. See **MILITARY POLICE** for description of various military and semi-military organizations of this nature.

MOUNT FOREST. A town of Wellington County, Ontario, Canada, on a branch of the Saugeen River, 73 miles northeast of London (Map: Ontario, C 4). It has manufacturing industries, and is at the junction of the Grand Trunk and Canadian Pacific railways. Population, in 1891, 2214; in 1901, 2019.

MOUNTFORT, WILLIAM (1660?-92). An English actor and playwright. As early as 1678 he was playing in London. After 1682 he was a member of the company at the Theatre Royal, and was the creator of many parts in the drama of the time, besides writing and adapting several plays, such as *The Injur'd Lovers, or the Ambitious Father* (publ. 1688); *Successful Strangers* (1690); *King Edward the Third* (1691); and *Greenwich Park* (1691). According to the common account of his death, he was assassinated, December 9, 1692, by Capt. Richard Hill, a jealous admirer of Mrs. Bracegirdle. Consult: Cook, *Hours With the Players* (London, 1881); Galt, *Lives of the Players* (London, 1831); Cibber, *Apology*, ed. Lowe (London, 1889).

MOUNT GILEAD. A village and the county-seat of Morrow County, Ohio, 47 miles-north

by east of Columbus; on the Whetstone River, and on the Toledo and Ohio Central, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads (Map: Ohio, E 4). It has a public school library. There are some manufactures and a trade with the surrounding agricultural country. Population, in 1890, 1329; in 1900, 1528.

MOUNT HOLLY. A town and the county-seat of Burlington County, N. J., 19 miles east by north of Philadelphia; on Rancocas Creek and on the Pennsylvania Railroad (Map: New Jersey, C 4). It has the Burlington County Hospital, Children's Home, and the Burlington County Lyceum of History and Natural Science, founded in 1876, which possesses a library of 6500 volumes. The industries are represented by several extensive shoe factories, and by foundries, canneries, a hammock factory, etc. Population, in 1890, 5376; in 1900, 5168.

MOUNT HOLYOKE COLLEGE. An denominational woman's college in South Hadley, Mass., founded by Mary Lyon as a seminary in 1837 and chartered as a college in 1888. In addition to the regular undergraduate courses, provision is made for graduate work, and special courses are open to teachers. The four years' course consists of two years of prescribed work and two years elective, and leads to the degree of B.A. The college offers a large number of scholarships and two graduate fellowships. During the collegiate year 1902-03 the college had 83 instructors and officers, and an enrollment of 671. The campus includes 150 acres, attractively laid out, and contains seven dormitories; Mary Lyon Hall occupying the site of the original building destroyed by fire in 1896, and including the chapel and offices of administration; a well-equipped gymnasium; an observatory; Lydia Shattuck Hall for chemistry and physics; Lyman Williston Hall for natural sciences; Dwight Memorial Art Building, opened in 1902; and the library, with a permanent fund of \$10,000, containing 23,000 volumes and 3800 pamphlets. Its productive funds amounted to \$613,000, and its gross income to \$168,000. The buildings and grounds were valued at \$862,000, and the whole college property at \$1,450,000.

MOUNT MORGAN. A municipality of Raglan County, Queensland, Australia, 23 miles southwest of Rockhampton, and 404 miles north of Brisbane by rail (Map: Queensland, G 7). It is noted for the abundance and richness of the gold deposits found on the mountain-summit and inclosed in a rock mass largely composed of iron ore and siliceous sinter. The yield of gold in 1900 was 187,352 ounces, valued at \$3,758,550. Population, in 1901, 6280.

MOUNT OF OLIVES. See OLIVES, MOUNT OF.

MOUNT OF OLIVES. An oratorio by Beethoven, originally *Christus am Oelberg*. (1803), produced in 1814. In reference to the sentiment against representing Christ as a character in a performance, David was substituted in his place, and the name of the oratorio was changed in 1842 to *Engedi*.

MOUNT PLEASANT. A city and the county-seat of Henry County, Iowa, 28 miles west by north of Burlington; on the Chicago, Burlington,

and Quincy Railroad (Map: Iowa, F 4). It is the seat of the State Hospital for the Insane, the Iowa Wesleyan University (Methodist Episcopal), opened in 1844, and the German College (Methodist Episcopal), opened in 1873. It has also several secondary institutions, a conservatory of music, and a public library. Mount Pleasant is the centre of a productive farming country, and is an important shipping point for live stock, especially horses. There are grain elevators and manufactories of flour, lumber, carriages, and wagons, agricultural implements, brick and tile, etc. Limestone is extensively quarried in the vicinity. The water-works and electric light plant are owned by the municipality. Population, in 1890, 3997; in 1900, 4109.

MOUNT PLEASANT. A city and the county-seat of Isabella County, Mich., 53 miles west by north of Saginaw; on the Chippewa River, and on the Ann Arbor and the Pere Marquette railroads (Map: Michigan, J 5). It is the seat of the Central State Normal School and of a United States Government Indian school, and has a handsome court-house. A fertile agricultural region surrounds the city, and there are manufactures of lumber and various lumber products, flour, woolen goods, plows, foundry products, gasoline engines, brick and tile, wagons, etc. The water-works are owned and operated by the municipality. Population, in 1890, 2701; in 1900, 3662.

MOUNT PLEASANT. A borough in Westmoreland County, Pa., 11 miles south of Greensburg, the county-seat; on the Baltimore and Ohio and the Pennsylvania railroads (Map: Pennsylvania, B 3). It is the seat of the Western Pennsylvania Classical and Scientific Institute (Baptist). The borough is the centre of an extensive coke-making industry, and manufactures also flour, lumber, iron, foundry products, glass, etc. Population, in 1890, 3652; in 1900, 4745.

MOUNT SAINT MARY'S COLLEGE. A Roman Catholic college at Emmitsburg, Md., founded in 1808. Its material interests are under the control of a board of directors, of whom the Archbishop of Baltimore is president. In addition to the regular college work, it has a preparatory and a scientific and business course, with a total registration in 1902 of 220 students and 15 instructors. It confers the degree of B.A. The library contains 27,000 volumes. The buildings and grounds are valued at about \$200,000. The income was about \$50,000.

MOUNT-STEPHEN, GEORGE STEPHEN, Baron (1829-). A Canadian capitalist, born at Dufftown, Banffshire, Scotland. He came to Canada in 1850 and entered the dry goods business in Montreal. He succeeded there as a cloth manufacturer, and became wealthy, but was conspicuous chiefly for his share in carrying through to completion the long-delayed Canadian Pacific Railway, of which he became president in 1881. For his services in this connection he was knighted by Queen Victoria (1886), and the following year he and Sir Donald Smith gave \$500,000 each for the building of the Victoria Hospital in commemoration of her Majesty's jubilee. In 1888 he went to reside in England, and in 1891 he was created first Baron Mount-Stephen,

a title taken from a peak in the Rocky Mountains named for him during the construction of the Canadian Pacific Railroad.

MOUNT STERLING. A town and the county-seat of Brown County, Ill., 38 miles east of Quincy; on the Wabash Railroad (Map: Illinois, B 4). It has manufactures of flour, wagons, brick, drain tile, etc., and in the vicinity, which is interested chiefly in agriculture, are coal and clay deposits. The water-works are owned by the municipality. Population, in 1890, 1655; in 1900, 1960.

MOUNT STERLING. A city and the county-seat of Montgomery County, Ky., 33 miles east of Lexington; on the Chesapeake and Ohio Railroad (Map: Kentucky, H 2). It has a public library and several private educational institutions. The city controls important commercial interests, and among its industrial establishments are planing mills; flouring mills, machine shops, and a distillery. Population, in 1890, 3629; in 1900, 3561.

MOUNT VERNON. The home and burial-place of George Washington, in Fairfax County, Virginia; on the right bank of the Potomac, 15 miles south of Washington, D. C. The Washington mansion, beautifully situated on an eminence, commanding a view of the river, is of wood, two stories high, ninety-six feet long, and thirty feet deep. It was built in 1743 by Washington's elder brother, Lawrence, who called it Mount Vernon, after Admiral Vernon, under whom he had served in the British Navy. A high piazza runs along the front of the house, which has six rooms of moderate size on the ground floor, containing many objects of historical interest. The tomb to which Washington's remains were removed from the old family vault in 1831 stands a few hundred yards from the house, near a wooded ravine. Mount Vernon, which had been much enlarged by Washington, was by him bequeathed to Bushrod Washington, upon whose death it came into the hands of John A. Washington, his nephew, who sold it in 1858 to the Ladies' Mount Vernon Association, which holds it in trust as a place of national interest. Consult: Lossing, *The Home of Washington and Its Associations, Historical, Biographical, and Pictorial* (new ed., New York, 1865); and Wineberger, *Home of Washington at Mount Vernon and Its Associations* (Washington, 1866).

MOUNT VERNON. A city and the county-seat of Jefferson County, Ill., 76 miles east by south of Saint Louis, Mo.; on the Chicago and Eastern Illinois, the Southern, the Louisville and Nashville, and the Wabash, Chester and Western railroads (Map: Illinois, D 5). It has an attractive Supreme Court building, and is engaged principally in agriculture, coal mining, and in the manufacture of cars, machine-shop products, axe handles, lumber, flour, etc. There are also a large grain elevator, marble works, and a tie-preserving establishment. Mount Vernon was laid out in 1819 and was incorporated first in 1872. The government is administered under the original charter of incorporation, which provides for a mayor, elected every two years, and a unicameral council. Population, in 1890, 3233; in 1900, 5216.

MOUNT VERNON. A city and the county-seat of Posey County, Ind., 18 miles west by

south of Evansville; on the Ohio River, and on the Louisville and Nashville and the Evansville and Terre Haute railroads (Map: Indiana, B 5). It has a fine court-house and the Alexandrian Public Library. There are manufactories of flour, hominy, lumber, foundry, and machine-shop products, engines, carriages, etc. Mount Vernon is a commercial centre of considerable importance for a fertile region in which coal is abundant. Population, in 1890, 4765; in 1900, 5132.

MOUNT VERNON. A town in Linn County, Iowa, 16 miles east by south of Cedar Rapids; on the Chicago and Northwestern Railroad (Map: Iowa, F 3). Cornell College (Methodist Episcopal), opened in 1857, is situated here. The town is surrounded by a rich farming region, and has considerable trade. Population, in 1890, 1259; in 1900, 1629.

MOUNT VERNON. A city in Westchester County, N. Y., on Eastchester Creek, an arm of Long Island Sound, and the Bronx River, and on the New York Central and Hudson River and the New York, New Haven and Hartford railroads (Map: New York, G 5). It is chiefly a residential suburb of New York City, which it adjoins on the north. It has some handsome streets paved with macadam and asphalt, and in the more elevated sections of the city, which command fine views of the Sound, there are costly mansions. Mount Vernon maintains a public library, founded in 1896, for which a \$50,000 building, the gift of Andrew Carnegie, was begun in 1903. Among the prominent edifices are the Lucas Building, which contains the city offices, the Mount Vernon Hospital, the new postoffice, and many churches and school buildings. Mount Vernon was founded in 1852 and incorporated as a village in the following year, and in 1892 was chartered as a city. The government, under the original charter, is vested in a mayor, elected every two years, and a municipal council. Most of the administrative officials are appointed by the mayor and confirmed by the council. The comptroller, receiver of taxes, assessors, and board of education, however, are chosen by popular vote. Population, in 1890, 10,830; in 1900, 21,228.

MOUNT VERNON. A city and the county-seat of Knox County, Ohio, 25 miles north by west of Newark; on the Kokosing River, and on the Baltimore and Ohio and the Cleveland, Akron and Columbus railroads (Map: Ohio, F 5). It has a fine court-house, a public library and Hiawatha Park with a picturesque lake. There are locomotive works, bridge works, Corliss engine works, a large foundry, flour and saw mills, bent-wood works, and manufactories of furniture, hoops, staves, sashes, and doors. The city is the centre of a fertile agricultural region with which it carries on a considerable trade, and near by is found natural gas in abundance. The water-works are owned by the municipality. Population, in 1890, 6017; in 1900, 6633.

MOUNT WASHINGTON. See WASHINGTON, MOUNT.

MOURNING BRIDE, THE. A play by William Congreve (1697). Alphonso, Prince of Valentia, and Almeria, daughter of the King of Granada, are shipwrecked when about to be married, and each believes that the other has been drowned. Alphonso, taken prisoner, under an

MOUNT VERNON

Copyright 1888, by Leet Brothers

MOUNT VERNON

assumed name, finds Almeria at the Court of Granada, and the wedding is eventually accomplished. The play is the source of the famous lines beginning, "Music hath charms to soothe the savage breast."

MOURNING-CLOAK. A handsome butterfly (*Euvanesa*, or *Vanessa*, *antiopa*), known in England as the Camberwell beauty. It appears

THE MOURNING-CLOAK.

in the United States very early in the spring, and may not infrequently be seen flying about on warm days in winter. It hibernates in the adult stage even in cold climates. According to Scudder, it ranges from the Arctic Circle to the thirtieth parallel of latitude. It is purplish brown, with wings bordered by yellow, brown, and blue. The larvæ are covered with black spines, and feed gregariously on willow, elm, poplar, and hackberry, often stripping the larger branches of leaves. The species is two-brooded and the second generation of moths appears in midsummer.

MOURNING DOVE. The Carolina dove. See DOVE.

MOURZOUK, mōōr-zōōk'. A town of Africa. See MURZUK.

MOUSCRON, mōōs'krōn. A town of Belgium in the Province of West Flanders, situated near the French frontier, 32 miles southwest of Ghent. It is a customs station, and manufactures furniture and cotton and woolen goods. Population, in 1890, 13,764; in 1900, 19,366.

MOUSE (AS., OHG. *mās*, Ger. *Maus*, Lat. *mus*, Gk. *μῆς*, *mys*, OChurch Slav. *myshī*, Skt. *māṣa*, mouse, from *muṣ*, to steal). The word mouse was originally applied to a small rodent mammal, *Mus musculus*, now called the house mouse, which was formerly confined to the Old World, but is now cosmopolitan in its distribution. Gradually the use of the word has extended to other small rodents, and especially in compounds to mammals not rodents, and even to birds. This troublesome little rodent is a small gray creature, with a body about three inches long and a tail half that length, the ears rather large and very delicate, and small feet. The color shows considerable variation, in some cases having a strong brown cast, while in others it becomes very pale and even fades to white. In its habits the mouse is largely nocturnal, though often seen during the day. It makes its home in sheltered nooks and crannies, where a nest of rags, paper, feathers, etc., is nicely made. Mice are very prolific, six to ten young being born at a time, and there are many broods during the year. Much has been written about the singing powers of the mouse, and the fact that it does sing is supported by the evidence of per-

VOL. XIV.—6.

fectly trustworthy witnesses. Mice are unquestionably fond of music, but it is not fully determined whether their ability to make it is normal or is an individual peculiarity. Some writers have gone so far as to assert that it is due only to a diseased throat.

The name mouse is applied to any representative of the genus *Mus* not big enough to call a rat. This genus is one of the largest of mammalian genera, including upward of 130 species, which vary considerably in size, somewhat in color, and not a little in the softness of the pelage. The upper molar teeth are always wide, with three series of tubercles, and therefore called trituberculate; in this respect *Mus* differs from all of the native American 'rats' and 'mice.' Another characteristic of the genus is the long, slender, rounded tail, with whorls of scales, and few hairs; in some mice this is almost prehensile. Besides the common mouse, the following may be mentioned as well-known European species of *Mus*: The wood mouse (*Mus sylvaticus*), which is a trifle larger than its cosmopolitan cousin, and on account of its longer tail is sometimes called the 'long-tailed field-mouse'; it is abundant in Great Britain, and is noted for the large stores of grain which it hoards. The harvest mouse (*Mus minutus*) is the smallest of British quadrupeds, the length exclusive of tail being only about 2½ inches; it occurs chiefly in the southern parts of England, and is notable for its curious globular nests, composed of grass leaves and panicles woven together and suspended between stalks of grain or tall grass; a somewhat smaller species (*Mus pumilus*) occurs in the south of Europe. Asia and Africa have many species, as the curious black-striped Barbary mouse, which looks like a miniature American ground-squirrel.

In America the name mouse is applied to a large number of small mammals, especially in such compounds as wood-mouse, field-mouse, etc. Some of these are very different from the true mice, but nearly all belong to the family Muridæ, though not to the Murinæ with the Old World mice. Many of them are voles, of the subfamily Arvicolinæ, while others are vesper-mice or 'white-footed' mice of the subfamily Cricetinae, to which the hamsters also belong. A typical American example of this latter group is the well-known and widely distributed white-footed mouse or 'deer-mouse' (*Peromyscus leucopus*), which is found, in some one of many local races, nearly throughout North America. It is about seven inches long, of which nearly one-half is the tail. The upper surface is fawn-color of some shade, while the under parts and the feet are snowy white. The ears are rather large, and the general form and appearance delicate and graceful. It is found in all sorts of situations and even lives in houses sometimes, like the common mouse. In the Central and Southern States, another species even handsomer than this occurs, known as the golden mouse (*Peromyscus aureolus*). It is golden cinnamon above and yellowish-white beneath. The largest and in some respects the most remarkable of this group is the rice-field mouse (*Oryzomys palustris*), which is ten or eleven inches long, dark grizzly rat-color, and has very harsh pelage. It is said to be more like the true mice than any other American species. The curious little harvest-mouse (*Ochetodon humilis*) of the Southern States is

one of the smallest of American quadrupeds, being only four inches long, and half of that is tail. More detailed information will be found under the names of these and other mice, as **MEADOW-MOUSE**, **JUMPING MOUSE**, etc. See also accompanying Plate of **MICE AND JERBOAS**.

Consult authorities cited under **MAMMALIA**.

MOUSE-BIRD. Any bird of the African genus *Colius* and family *Coliidae*; a coly. These birds have soft gray and white plumage, conical brightly colored bills, and long and narrow central tail feathers, and take their name not only from their ashy plumage, but from their mouse-like activity in scrambling about the branches of trees, where they hang head downward (even sleeping that way), and swing and twist like acrobats. They are enabled to do this by the striking peculiarity of structure in the feet, which have all four toes turned forward. They are fruit-eaters, go about in small bands, but fly poorly, and build their nests in dense shrubs. See Plate of **KINGFISHERS**, **MOTMOTS**, etc.

MOUSE-DEER. See **CHEVROTAIN**.

MOUSE-EAR CHICKWEED (*Cerastium*). A genus of numerous species of plants of the natural order *Caryophyllaceae*, natives of temperate and cold countries throughout the world. Some of them are among common weeds; others, having larger flowers, are occasionally planted in flower borders and on rock-work. The form and hairiness of the leaves of some species have given rise to the popular name.

MOUSE-FISH. One of the tropical frogfishes (*Pterophrone histrio*), common in the Gulf of Mexico, the colors of which are highly variable. It is related to the anglers (q.v.), and its 'bait' is its first dorsal spine, which is bifurcate. The fact that it is frequently found in the fields of sargasso-weed of the Atlantic gives it a second name, 'sargassum-fish.'

MOUSE-LEMUR. A very small woolly lemur of Madagascar, nocturnal and mouselike in its appearance and habits. It is a member of the genus *Chirogale* (q.v.). See **LEMUR**; **CHIROGALE**; Plate of **LEMURS**.

MOUSE TOWER. A tower built on a rock in the middle of the Rhine near Bingen. According to popular tradition, it was hastily erected by Archbishop Hatto I. of Mainz (q.v.) as a refuge from the swarms of mice sent to devour him in punishment for his cruelty to the poor, whom he burned in a granary during a famine. The German name *Mäuseturm* is probably a popular corruption of *Mautturm*, toll-tower, for which the structure appears to have been originally intended, and the legend was built about the name. According to some authorities, the building was a watch tower, and the name is referred to Old German *musen*, to spy. It is now used as a signaling station for steamers.

MOUSTERIAN (moo-stē-ri-an) **EPOCH.** The name applied to a supposed epoch in European prehistoric archaeology, so called from Le Moustier, in the commune of Peyzac (Dordogne), France. The epoch is assigned to the beginning of the second Glacial age, and is characterized by distinctly refined stone working, by a cold climate, and by the occurrence of the cave bear, the musk-ox, and the *Rhinoceros tichorhinus* in France. It is well represented also in

Belgium, Southern Germany, Bohemia, and Southern England, not only by relics, but by human remains. Consult Mortillet, *Le préhistorique* (Paris, 1900).

MOUTH (AS. *maþ*, Goth. *munþa*, OHG. *mund*, Ger. *Mund*, mouth; connected with Lat. *mentum*, chin, and ultimately with Skt. *mukha*, face). In an animal, the opening through which food enters the body. Not all animals have mouths, for certain parasitic forms, notably the tapeworm, lack a system for digesting food, and consequently no opening for its entrance is necessary; in such cases the food is absorbed through the surface of the animal. The simplest form of mouth is that which occurs in the Protozoa, where the food is taken into the body through a special opening, which is fairly constant in position and may be surrounded with cilia, sometimes long. Many Protozoa, as well as sponges, have no mouth in any true sense, as the food may be taken in at any part of the body-surface, and therefore the opening has no fixed position and no regular size or form. The mouth of corals, jelly-fish, sea-anemones, and other coelenterates is simply an opening, almost always central in position, on the lower surface in free-swimming forms, on the upper surface in fixed forms. It is usually circular, but may be flattened, and in one group of jelly-fish it is divided up into four or more, sometimes innumerable, small openings, by the growing together of the lobes on its margin. In the flatworms the mouth is usually circular and is often in the centre of a sucker, but its position is variable, though it is always on the ventral side. It may be near the anterior end of the animal, but it is more often at the centre and is sometimes posterior. Among the various classes of worms the mouth is always anterior, and often terminal, though more often on the lower side of one of the first segments, or, in unsegmented forms, in a similar position. In blood-suckers it lies in the centre of a powerful sucker, and is provided with three chitinous jaws; in vegetable-eating and some carnivorous forms (nemertines) it is a simple opening without jaws, while in such active carnivorous worms, as *Nereis*, it is provided with powerful jaws. These jaws, however, are clearly modified segmental appendages, and are practically feet which have become modified to assist in seizing food or forcing it into the mouth. In the crustaceans, insects, spiders, and the like (arthropods) the mouth is more or less terminal, and is provided with lateral jaws; sometimes as many as eight pairs of appendages are modified to serve for this purpose. The structure and arrangement of the mouth parts in insects are very complicated, and are of great importance in classification. Roughly they may be grouped as *biting*, when there are freely movable lateral jaws which seize and cut or tear the food; *piercing*, when the various parts are more or less united to form a sharp, piercing instrument, which penetrates animal or plant membranes in search of the fluid food, which is then sucked; *sucking*, when the parts are united to form a suctorial tube, with no adaptation for piercing.

Among echinoderms the mouth shows considerable variety of form. In mollusks the mouth is generally anterior and often ventral, but it is frequently terminal. In the devil-fish, squids, and the like, it is in the centre of the foot. In

MICE AND JERBOAS

1. AMERICAN JUMPING MOUSE (*Zapus Hudsonius*).
2. EGYPTIAN JERBOA (*Dipus Aegypticus*).
3. YARKAND JERBOA (*Euchoreutes naso*).
4. KIRGHIZ JERBOA (*Alactaga decumana*).

5. BARBARY STRIPED MOUSE (*Mus Barbarus*).
6. HOUSE-MOUSE (*Mus musculus*).
7. HARVEST-MOUSE (*Mus minutus*).
8. MEADOW-MOUSE (*Microtus Pennsylvanicus*).

is practically synonymous with personal property in American and English law. See CHATTEL; PERSONAL PROPERTY; REAL PROPERTY.

MOVEMENT. Several modes of movement are manifested in plants and plant organs. Some of the lower forms (bacteria, algæ, and fungi) exhibit movements of locomotion in certain stages, 'swimming' freely in the water in which they are found. The same is true of the zoöspores and conjugating sexual cells (gametes) of many plants which themselves are not motile. Also, the plasmodia of slime molds show a peculiar flowing of the protoplasm which results in motion from one place on the substratum to another. This is called amœboid movement. Another kind of movement often met with in plants is the so-called hygroscopic movement. This is shown by the awns of certain grasses and other fruits ('seeds') (Fig. 1.), by the valves of many seed-pods (Fig. 2.), by the teeth of the peristome of moss capsules, and by the elaters of liverworts, horsetails (*Equisetum*), etc. It is a phenomenon having no connection whatever with the vitality of the parts, being due merely to unequal swelling or shrinkage (i.e. warping) of the different tissues by reason of their unequal absorption or loss of water; and this depends on the unlike composition of the material of the cell walls.

From a physiological point of view perhaps the most important form of plant movement is that exhibited

and forward, while the whole leaf sinks (Fig. 3). If a shock be given to one pinnule, the disturbance there set up, if severe enough, is propagated to other parts of the same leaf and even to other

FIG. 2. HYGROSCOPIC MOVEMENTS OF THE VALVES OF SEED PODS.

1, *Campanula rapunculoides*; a, when dry; b, when wet; 2, *Linaria Macedonica*; a, dry; b, wet.

leaves. Almost any portion of the plant can receive a stimulus in this way and pass it on to other regions. The organs which execute the visible response are motor organs (q.v.), cushions

FIG. 1. FRUIT OF *ERODIUM GRUINUM*.

a, When wet; b, when dry; the straightening of b when tip is caught in grass and the awn absorbs moisture bores the seed containing lower part into the soil, and so 'plants' it.

by the leaves of the so-called sensitive plants. The best example of this is found in the *Mimosa* of greenhouses. When this plant is jarred, struck, locally burned, or injured otherwise, its leaves suddenly collapse, even those at a distance from the shock. Its leaves are doubly compound, and in closing the pinnules rise so that the upper faces of opposite ones are brought together, the pinnæ drop downward

FIG. 3. LEAF OF THE SENSITIVE PLANT (*Mimosa*). a, In light when undisturbed; b, after shaking.

of tissue (pulvini) situated one at the base of the leaf, of each pinna, and of each pinnule. Indigenous plants which show this reaction, though not so strikingly, are the common oxalis and different species of *Cassia*.

The so-called 'sleep movements' of leaves of the pea family, *Oxalis*, etc., are executed by the same motor organs, which, however, are often less perfectly developed. These movements consist of changes in the position of the leaf following variations in the intensity of illumination, so that these leaves have a nocturnal and a diurnal

the clams and other lamellibranchs there are special organs of sense, known as labial palps, on each side of the mouth, but there is no tongue, while in all other mollusks a tongue covered with teeth and known as the radula is present. The cephalopods (squids and the like) have powerful jaws, arranged like the beak of a parrot, but in all other mollusks the jaws are small and rather weak, sometimes three in number, or they may be wholly wanting, as in the lamellibranchs.

In the vertebrates we find the formation of the mouth is used by some writers to divide them into two contrasted groups, the *cyclostomes* or round-mouths, and the *gnathostomes* or jaw-mouths. The round-mouths include only three or four genera, and are characterized by the absence of jaws, the mouth serving as a sucking organ. The surface of this mouth-sucker bears characteristic horny teeth. All the other vertebrates are *gnathostomes*, provided with vertically moving upper and lower jaws, one or both of which, except in birds, turtles, and some whales, bear teeth. There are also a tongue and various glands, notably the salivary glands. True lips, provided with muscles, are characteristic of mammals, but are also found in dipnoid fishes. In many mammals the sides of the buccal cavity—that is, the space outside the jaws—are enlarged to form cheek-pouches, of use as food reservoirs. The origin of the vertebrate mouth has been a matter of much discussion, and is closely associated with the still more fundamental question of the origin of the skull. Apparently, however, the jaws arise as modifications of the first branchial arch, which becomes divided into two parts, the proximal giving rise to the quadrate bone, which gives rise to an anterior process, forming a sort of primary upper jaw; the distal part is the cartilage of Meckel, the basis of the lower jaw.

See **TEETH; TONGUE; GLAND; SKULL.**

MOUTH, DISEASES OF THE. From its situation at the portal of the digestive tract, the mucous membrane lining this cavity is peculiarly exposed to many forms of irritation and infection. The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gr. *stoma*, the mouth), as it is termed by nosologists:

(1) *Acute catarrhal stomatitis*, which may extend over the mouth, including the tongue, or may occur in limited areas, is seen in children, associated with dentition or gastro-intestinal disturbances, and in adults following excessive smoking or the taking of hot or too highly seasoned food. It is a frequent concomitant of indigestion and febrile diseases, but is more commonly a complication of other diseases than an original affection. In ordinary cases a simple mouth-wash composed of a solution of borax and honey, and gentle catharsis, will effect a rapid cure.

(2) *Parasitic stomatitis*, a diffuse inflammation with the formation of patches of false membrane, is caused by a fungus—the *saccharomyces albicans*. It occurs most commonly in young children, and is described under its popular name, **THRUSH.**

(3) *Aphthous stomatitis*, also known as follicular or vesicular stomatitis, is an inflammation of the follicles of the mucous membrane, and is described in the article **APHTHÆ.**

(4) *Ulcerative stomatitis*, sometimes called *fetid stomatitis* or putrid sore mouth, generally occurs in children after the first dentition, and is associated with defective hygienic and sanitary conditions. The ulcerative process begins usually at the margin of the gums and extends along the gum lines of the jaws. The bases of the ulcers are covered with a grayish-white adherent membrane. The swelling of the adjacent parts is often so considerable as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The ulceration may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of small doses of chlorate of potash, and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

(5) *Gangrenous stomatitis*, or *cancrem oris*, is the most severe form of stomatitis, and occurs as a rule in feeble children between two and five years old during convalescence from the acute fevers. It is characterized by a rapidly progressing gangrene, beginning on the cheeks or gums, resulting in extensive destruction of the soft tissues, at times even invading the jaw bones. The constitutional disturbance is great and the prostration extreme, and the case usually terminates in death. Treatment is unsatisfactory. Early destruction of the ulcer by the cautery, careful nourishment, and free stimulation may arrest the disease.

(6) *Mercurial stomatitis* and other diseases of the mouth are noticed in the articles **SALIVATION; SCURVY; TONGUE.**

MOUTON, mōō-tōn', ALEXANDER (1804-85). An American politician, born in what is now Lafayette Parish, La. He graduated at Georgetown College (D. C.), studied law, and was admitted to the bar in 1825. In 1826 he was elected to the Lower House of the Legislature, and was Speaker in 1831-32. He was a Presidential Elector in 1828, 1832, and 1836, and in 1837 was elected to the United States Senate. He resigned in 1842 to accept the nomination for Governor of Louisiana, was elected, and served from 1843 till the adoption of the new Constitution in 1846. He was president of the Southwestern Railway Convention in 1853 and a delegate to the National Democratic conventions in 1856 and 1860. In 1861 he presided over the convention called to consider the question of seceding from the Union. He then retired to his plantation, where he spent the remainder of his life.

MOVABLES (OF. *movable*, *mouvable*, Fr. *mouvable*, from Lat. *movere*, to move). Such subjects of property as can be transported from one place to another without injury, and which cannot be classed as real property. The term is used as contradistinguished from things immovable, or real property, but is employed in a narrower sense than the term personal property, which includes many subjects of property rights which are not real estate, and yet which cannot be said to be capable of being moved or transported in the strict sense, as choses or rights of action and growing crops in some cases.

In Scotch law, the word *movables* is used as contradistinguished from heritable property, and

the speed is uniform, it is impossible to perceive any motion whatsoever; acceleration or diminution of this rate, however, sets up certain sensations due to the inertia of the body, and perhaps, too, other sensations mediated by the semicircular canals. See **STATIC SENSE**.

James, *Principles of Psychology* (New York, 1890).

MOVEMENT CURE. A hygienic and therapeutic system for the preservation as well as the recovery of health, introduced by Pehr Henry Ling (born in 1766), a native of Smaland, Sweden. It is a modified form of gymnastics, being systematized and specially adapted to the treatment of invalids in a reduced condition, and possesses, in many respects, advantages over ordinary gymnastics. The system consists essentially in carefully prescribed movements of the whole body or of individual groups of muscles, either with or without resistance. Ling's methods obtained wide recognition both in Europe and America. In Sweden a Royal ordinance was issued for the establishment of an institution devoted to the method of exercise. See **LING, P. H.**

Various modifications of this system were made from time to time, and massage and movement were gradually combined in the more modern schemes of mechano-therapy, which are designed merely to correct morbid conditions of the body by means of active or passive movements. "These movements are active when they are executed by the patient's own volition, and passive when performed upon his body or with it or upon parts of it by the will of another."

Mechano-therapy has probably reached its highest development in the ingenious inventions of Dr. Gustaf Zander, of Stockholm. About the middle of the last century Zander introduced the first of these ingenious contrivances for administering the well-known 'Swedish movements.' From crude beginnings he developed his 'system' until he had perfected over seventy varieties of apparatus, some of them weighing nearly a ton, by which the most delicate child and the most unwieldy adult can be treated with equal ease and advantage. These machines range from a simple apparatus for moving a single joint or group of muscles to complicated mechanisms which closely imitate the motions of the body performed in horseback or even camel riding—the latter technically known as 'trunk circumduction.' Zander institutes have been established in all the important cities and health resorts in Europe, and there is one in New York City.

Mechano-therapy is not designed, nor should it be resorted to, as a substitute for the natural, unconscious exercise in the open air, such as is obtained in the various outdoor recreations, but is applicable to those suffering from general weakness, or from affections of particular portions of the body, such as local paralysis or joint affections, which would render general movement painful, harmful, or impossible. Another large class of persons who are likely to find benefit are

those who are afflicted with deformities, due either to habit or disease. In such cases the orthopedist often finds a valuable ally in the movement cure. The subject is intimately related to massage (q.v.). For fuller information, consult: Grafstrom, *Mechano-Therapy* (Philadelphia, 1899), and Nissen, *A B C of the Swedish System of Educational Gymnastics* (Philadelphia and London, 1891).

MOVERS, mō'vərs, FRANZ KARL (1806-56). A German Orientalist. He was born at Koesfeld, Prussia, and was educated at Münster and Bonn. After being settled for six years over a church in Berkum, he was in 1839 appointed professor of theology in the University of Breslau, where he remained until his death. His exhaustive and scholarly treatise on the Phœnicians, *Die Phönizier* (vol. i., 1841; vol. ii., 1849-56), is his best-known work. He also wrote *Kritische Untersuchungen über die biblische Chronik* (1834).

MO'VILLE. A seaport, market-town, and summer bathing resort, in County Donegal, Ireland, on Lough Foyle, 17 miles north-northeast of Londonderry (Map: Ireland, D 1). It is noted as a calling station of the transatlantic mail steamers from New York to Glasgow. Population, 1500.

MOVING PLANT (*Desmodium gyrans*). An East Indian plant of the natural order Leguminosæ, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves, which are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downward by similar rapid jerks. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones. See **MOVEMENT**.

MOWAT, mō'at, Sir OLIVER (1820-1903). A Canadian statesman, born in Kingston, Ontario, of Scottish parentage. In that city and in Toronto he was educated. He became a barrister (1841), practiced his profession in Toronto, was made Queen's Counsel in 1856, and the same year was a commissioner for consolidating the statutes of Canada, of Upper Canada, and afterwards of Ontario. He was a Liberal member of Parliament for South Ontario in 1857-64, a Cabinet minister in 1858, Postmaster-General in 1863-64, and Vice-Chancellor of Ontario from 1864 until 1872, when he became Prime Minister of that province and its Attorney-General, as well as a member of Parliament for North Oxford. These positions he held until 1896, when he was made Minister of Justice in the Dominion Cabinet and leader of the Senate. In 1897 he was appointed Lieutenant-Governor of Ontario.

MOWBRAY, mō'brā, HENRY SIDDONS (1858—). An American figure painter, born of English parentage in Alexandria, Egypt. He came to the United States at an early age. In 1878 he went to Paris, where he remained several years, and became a pupil of Bonnat. He is well known as an illustrator. His technique is clever and his color well handled and brilliant. The most important of his works are "Aladdin," "Rose Harvest," "Arcadie," "Scheherezade," and "Evening Breeze."

MOWBRAY, ROBERT DE, Earl of Northumberland. See NORTHUMBERLAND.

MOWER. See REAPERS, REAPING.

MOWER, mō'ēr, JOSEPH ANTHONY (1827-70). An American soldier, born at Woodstock, Vt. He fought in the ranks during the Mexican War, but rose, in 1861, to be a captain in the Regular Army. During the first year of the Civil War he took part in the military operations in Kentucky and Tennessee, rendering conspicuous service. In November, 1862, he was promoted to brigadier-general, and was placed in command of a brigade before Vicksburg (1863). In 1864 he was promoted to the rank of major-general of volunteers and commanded a division in Louisiana. Later he accompanied Sherman in the Atlanta campaign. Upon the reorganization of the army at the close of the war, he was commissioned colonel of the Thirty-ninth Infantry and received command of the Military Department of Louisiana.

MOWBY, mō'ri, WILLIAM AUGUSTUS (1829—). An American educator and historical writer, born at Uxbridge, Mass. He studied at Phillips Academy and at Brown University, and for many years was engaged in educational work in Rhode Island and Massachusetts. In 1884-85 he was editor of the *Journal of Education*, and from 1886 until 1891 of *Education*. Among his historical publications are: *A History of the United States* (1876); *First Steps in the History of Our Country* (1898); *American Inventions and Inventors* (1900); and *Marcus Whitman and Early Oregon* (1901), a work which aroused considerable controversy.

MOXA. The downy hairs of *Artemisia Moxa*, a plant of the natural order Compositae; also the plant itself. The Chinese and Japanese use this substance as a cautery and a counter-irritant.

MOX'OM, PHILIP STAFFORD (1848—). An American clergyman, born at Markham, Canada. He came to the United States at an early age, and a year after the outbreak of the Civil War joined the Federal Army. In 1875 he entered the Rochester Theological Seminary, where he remained three years, then entered the University of Rochester, where he graduated in 1879. He was pastor of the First Baptist Church in Cleveland, Ohio, from 1879 until 1885, and of the First Baptist Church in Boston from 1885 until 1894, when he took charge of the South Congregational Church in Springfield, Mass. His publications include: *The Aim of Life* (1894); *From Jerusalem to Nicea: The Church in the First Three Centuries* (1895); and *The Religion of Hope* (1896).

MOXOS, mō'hōs, MOJOS, MOHOS, or MUSU, mōō'sōō. A noted group of tribes occupying the Province of Moxos, on the upper region of the Mamoré and Beni rivers, in Northeastern Bolivia, and speaking a language of the widespread Arawakan stock (q.v.). By submitting themselves to the Inca Yupanqui they became incorporated with the Peruvian Empire (see QUICHUA), and an Inca colony was established in the province. In 1564 they repelled a Spanish invasion of their country, but in 1674 readily accepted the teaching of the Jesuit missionary Baraza, who worked among them for nearly thirty years, and succeeded in collecting them into fifteen mission villages, at the same time teaching them agricul-

ture, weaving, and carpentry. Moxos missions grew and flourished, other neighboring tribes being also gathered into them, until in 1726 their fifteen villages numbered 30,000 Christian Indians, representing nearly thirty tribes and at least nine distinct languages, the Moxos proper predominating. With the expulsion of the Jesuits in 1767 the mission period came to an end, but the former converts maintained themselves as a civilized population and exist to-day in practically undiminished numbers. Physically they are of rather light complexion, with intelligent and handsome features. They are grave and thoughtful, honest, and devoutly religious, peaceable and civil, but carrying always an air of independence. They are successful farmers, expert boatmen, and skillful with the lariat.

MOYABAMBA, mō'yā-bām'bā. A town of Peru. See MOYOBAMBA.

MOYA Y CONTRERAS, mō'yā ē kōn-trā'rās, PEDRO DE (c.1520-91). A Spanish prelate and administrator, born in the Diocese of Cordova. Already known as an Inquisitor in Murcia, he was sent to Mexico, became Archbishop of the City of Mexico, and established the Inquisition there in 1574. For one year, 1584-85, he was also Viceroy. After his return to Spain in 1591 he was appointed president of the Council of the Indies.

MOYOBAMBA, mō'yō-bām'bā, or **MOYA-BAMBA**. The capital of the Department of Loreto, Peru. It is situated in the northwestern part of the department, on the River Mayo, and on a plateau of loose, sandy material, which the floods wash out, forming large ravines penetrating the town (Map: Peru, B 5). The town consists mainly of isolated houses thatched with palm leaves and scattered over a large area. The principal industry is the manufacture of Panama hats. Moyobamba has some trade with Brazil by way of the Amazon, with which the Mayo communicates through the Huallaga, but otherwise it is practically cut off from communication with the rest of Peru. Population, in 1895, 10,000.

MOYSE, mwāz, HYACINTHE (1769-1801). A Haitian revolutionist, nephew of Toussaint L'Ouverture. His success at La Croix des Bouquets, whence he drove the whites to Port-au-Prince, brought on a general revolt in the south and west. In 1794 he put himself under the command of Toussaint L'Ouverture, and with him drove out the English. In 1801 he became commander of the Army of the North in the attack on Spanish Santo Domingo. At the close of the same year he was accused of instigating a revolt in the north; was arrested and court-martialed; and with twenty-three of his men was blown from the cannon mouth.

MOZAMBIQUE, mō'zam-bēk'. The former name of Portuguese East Africa (q.v.), now restricted to the northeastern coast of that colony.

MOZAMBIQUE. The capital of the Portuguese Province of Mozambique, situated on a small coral island separated by a strait a mile wide from the east coast of Africa, at the narrowest part of the Mozambique Channel (Map: Africa, J 6). Its principal buildings are the Governor-General's palace, the custom-house, the hospital, and the cathedral. Mozambique was formerly a centre for the slave trade and has declined in importance since that era. There is

some traffic in rice, gum, gold-dust, and timber; the shipping amounts to 150,000 tons annually. The population, in 1900, was 5500, of whom 285 were Europeans, 226 Asiatics, and the rest natives.

MOZAMBIQUE CHANNEL. The body of water between the east coast of Africa and the island of Madagascar (Map: Africa, J 6). It is about 1000 miles long, and its width ranges from 260 miles at the middle to nearly 600 miles at either end. The principal river flowing into it is the Zambezi. The Comoro Islands lie in the north entrance to the channel, and on the west shore are the ports of Beira and Mozambique.

MOZARABIC LITURGY (Sp. *Mozárabe*, from Ar. *Mustarb*, from *ta 'arrab*, to become an Arab, from *'arab*, Arab), or GOTHIC LITURGY. The ancient liturgy of the Church of Spain. The former title is derived from the name applied to the Christian inhabitants after they were subjected to the Arab domination; the latter is applied to it because it was most widely used during the Gothic period. Its main structure indicates an Eastern origin; a plausible theory regards it as having been brought by the Goths from Constantinople or Asia Minor in the fifth century, and then revised by Saint Isidore of Seville. In the second half of the eleventh century the Roman liturgy began to supersede it; but this change was stubbornly resisted. In the end six churches in Toledo were assigned to the local rite. Cardinal Ximenes made special efforts at the beginning of the sixteenth century to prevent the liturgy from falling into oblivion, and founded a chapel expressly for its use. He also caused a number of learned priests to collate the existing manuscripts, and published a revised edition, unfortunately incomplete, in 1500-02. The affinities of this liturgy with the Gallican on the one hand and the Greek on the other make its study important to liturgical scholars. Besides the edition referred to, it was reprinted by Lesley (Rome, 1755), and by Lorenzana (ib., 1804); it is in Migne, *Patrologia Latina*, lxxxv., and a new edition appeared at Toledo in 1875. Consult Neale, *Essays in Liturgiology and Church History* (London, 1863); and see LITURGY.

MOZART, Ger. pron. mō'tsart, LEOPOLD (1719-87). A German musician, father of Wolfgang Amadeus Mozart, born at Augsburg. He was sent to study law at Salzburg, but became a chorister and afterwards a music teacher, as he played the violin well, and in 1743 was made a member of the Prince-Bishop's orchestra. In 1762 he was appointed Court composer. He produced about twelve oratorios, eighteen symphonies, six trio-sonatas, as well as serenades and concertos. Twelve of his pianoforte pieces were published under the title *Der Morgen und der Abend*. His famous violin method, almost the first of its kind, *Versuch einer gründlichen Violinschule* (1756), was often reprinted and translated, but his chief service to the world was the careful and sympathetic training of his son, the great Mozart, whose genius he judiciously fostered.

MOZART, WOLFGANG AMADEUS (1756-91). A famous German composer. He was born at Salzburg, Austria, January 27, 1756. Mozart's love for music first manifested itself when his eldest sister, 'Nannerl,' began to receive musical

instructions from her father. When he was only five years old he composed little minuets and was discovered at work on a concerto. At six he had become so proficient as a performer on the piano, and his sister's progress also had been so great, that their father took them on a tour of the leading capitals of Europe, everywhere meeting with notable receptions.

In 1768 the elder Mozart again took his son to Vienna. There this boy of twelve conducted a solemn mass of his own composition, and his operetta *Bastien und Bastienne* was given at a private performance. After a brief sojourn in Salzburg, where Wolfgang was appointed concert-meister to the Archbishop, his father took him to Italy. In Rome he heard the famous *Miserere* of Allegri, which was so jealously guarded by the authorities that musicians were forbidden to copy it under pain of excommunication. After twice hearing it young Mozart wrote it out by ear. His compositions and his performances made such a profound impression that the Pope created him a Knight of the Golden Spur, and at Bologna he was elected a member of the Philharmonic Society. At Milan he received a commission to compose an opera, the result being *Mitridate re di Ponto*, which was brought out in December, 1770, and had twenty consecutive performances. His knowledge of the Italian style of singing was greatly broadened through this Italian trip, and especially through his acquaintance with the male soprano Farinelli, the greatest singer of his time.

After another brief sojourn in Salzburg he returned in August, 1771, to Milan, where he brought out his serenata *Ascanio in Alba*, in honor of the nuptials of Archduke Ferdinand, a son of Maria Theresa. The death of Archbishop Sigismund at Salzburg was a severe blow to the Mozarts; for his successor, Hieronymus, for whose installation Mozart composed *Il sogno di Scipione* (The Dream of Scipio), showed little appreciation of his genius. Two other Italian stage works *Lucio Silla* and *La finta giardiniera* were produced in Milan, and the latter also in Munich; and on the occasion of Archduke Maximilian Francis's visit to Salzburg, in 1775, he brought out *Il re pastore*.

Disgusted with the obstacles which Hieronymus constantly threw in his way, Mozart, accompanied by his mother, again started out on his travels in September, 1777. In Mannheim he met the Weber family, which was destined to play an important part in his life. The head of this family, Fridolin von Weber, was prompter and copyist at the theatre. The eldest daughter, Josepha, afterwards Frau Hofer, was the prima donna for whom in later years Mozart wrote the "Queen of the Night" music in *The Magic Flute*. A younger daughter, Aloysia, afterwards Frau Lange, was for a time Mozart's pupil, and he promptly fell in love with her. Another daughter, Constanza, later became his wife. A trip to Paris ended tragically in his mother's death. He returned to Salzburg, stopping on his way in Munich, where Aloysia had secured a position, and where he learned that she no longer cared for him. In after years, however, this youthful sweetheart did more than any other singer to make his music famous. While in Paris he made a friend of the encyclopædist Grimm.

At Salzburg he composed the music to the tragedy *King Thamos*, and began the composition of an operetta, *Zaide*, which was interrupted by

WOLFGANG AMADEUS MOZART

an invitation to compose an opera for Munich. *Zaide* was never finished, but the result of the Munich invitation was the opera *Idomeneo*, which opened a new epoch in his life, being his first masterpiece in the grand style. During a visit to Vienna in 1781, Mozart terminated once for all his relations with the boorish Hieronymus, who had grossly insulted him. He took up his residence with the Webers, who were now in Vienna. His father strongly objected to this, and he moved his lodgings. But he had fallen in love with Constanza, and in August, 1782, they were married. Notwithstanding the grinding poverty of their lot, their marriage was a happy one, for their mutual love atoned for the hardships which constantly confronted them. His marriage took place shortly after the production in Vienna of his opera *Belmonte und Constanza, oder Die Entführung aus dem Serail*. The Italian musicians of Vienna, headed by Salieri, used all means in their power to have the production fail, but it was triumphantly successful. Gluck attended one of the performances and was enthusiastic in his approval of it. Nevertheless, from this time on Mozart was constantly met by the hostile machinations of the Salieri party, which greatly embittered his career.

The success of the opera led the Emperor to order a new opera buffa of Mozart, who, in connection with its composition, was brought together with Lorenzo da Ponte. The result was *Le nozze di Figaro*. Beaumarchais's work on which the libretto is based had been forbidden in Vienna on the ground of its immorality. Mozart, however, went to work on the score, and when part of it had been composed, Da Ponte found opportunity to have the Emperor hear it, with the result that he ordered its completion and performance. Besides this he gave the composer an order for a musical comedy, *Der Schauspieldirector*, for a garden fête at Schönbrunn. Throughout the preparations for the production of *Figaro* Salieri and his adherents were active in opposition, and the first performance, in May, 1786, came near being a failure. In January, 1787, however, it was received with immense enthusiasm at Prague, where Mozart became a popular idol. The concerts which he gave there were immensely successful, and he was engaged to write another opera. Da Ponte suggested *Don Giovanni* to him, and in April placed the libretto of the work in his hands. By September Mozart and his wife and Da Ponte were in Prague, rehearsals were taken in hand, and late in October *Don Giovanni* was produced, and was even more successful than *Figaro* had been.

During a tour undertaken in 1789 with Prince Carl Lichnowski, the destination being Berlin, Mozart stopped en route at Leipzig, where he played in the Thomaskirche and was deeply impressed with Bach's motets. In Berlin his success was such that Frederick William II. offered him a position as kapellmeister with a salary of 3000 thalers. But a few words of reassurance from the Austrian Emperor, accompanied with an order for a new opera, coupled with his own strong feeling of loyalty, unfortunately induced him to decline the King's offer, the best he had had. The opera was *Così fan tutte*, which was produced in Vienna in January, 1790. After a visit to Frankfurt to attend the coronation of the new Emperor, Leopold II., he returned to Vienna. Meanwhile his old acquaintance Schikaneder

was managing a theatre in Vienna. The affairs of the house being precarious, he thought to better them by producing an opera by Mozart, and so applied to him in the spring of 1791 to write a 'fairy' opera—a piece that would attract. Schikaneder himself furnished for Mozart the libretto to the *Zauberflöte* (*The Magic Flute*). The work was interrupted by an order to compose an opera for the coronation of Leopold as King of Bohemia at Prague, in 1791. It was *La clemenza di Tito*, written in a few weeks by a man already much overworked. It did not make much impression. *The Magic Flute* was brought out in September, 1791, under the composer's own direction, and with distinguished success.

But Mozart's constant struggle with intrigue and pecuniary necessities, and the strain to which he had subjected himself in order to meet these by constant work, had begun to tell upon him, and when, even before he had finished *The Magic Flute*, he received a mysterious commission to compose a requiem, he felt that he was writing his own swan song. It is now known that the commission came from a Count Walsegg, whose intention was to have the work performed as his own, and who therefore kept his identity from Mozart. So fixed became Mozart's idea that he must complete his *Requiem* before death overtook him that even when his wife drove out with him, so that he might be in the open air, he insisted on taking his portfolio of music paper along. It was on one of these drives that his melancholy led him to express the belief that he had been poisoned at the instigation of his Italian rivals, a suspicion which does not, however, seem to have been borne out. Feeling that he would not live long enough to finish the *Requiem* himself, he sketched out the principal features of the uncompleted part, leaving them for his pupil Süßmayer to fill out. The night before his death he gathered some of his favorite singers about him, had the score of the *Requiem* brought to his bed, and the work was sung until the "Lacrimosa" was reached, when Mozart burst into tears and closed the score. His death came at one o'clock in the morning of December 5th, and an eye-witness says that his last motion was an endeavor to imitate the kettledrums in the *Requiem*.

Although much of Mozart's music has been forgotten, he remains to the public one of the most fascinating figures in musical history. His buoyant nature, which seemed to override misfortune and intrigue and to laugh at poverty, has made him a type of the musical bohemian. Mozart is of greatest importance as an operatic composer, and as such he still ranks among the masters of music. His admirable handling of the human voice and his keen appreciation of dramatic effect have kept *Figaro*, *Don Giovanni*, and *The Magic Flute* in the repertory from the day they were produced. His vocal numbers not only are fine as music, but, being written with a knowledge of the voice, can be sung with telling effect by accomplished singers. With Gluck, Mozart lies at the foundation of German opera. He also was a prodigious worker in other departments of music. He produced no less than forty-one symphonies, the best known of which are those in *E flat Major* (the first symphony to employ clarinets), the *Jupiter* and the *G Minor*, church music, many works of chamber music, pianoforte compositions, and songs.

BIBLIOGRAPHY. Jahn; *Life of Mozart*, translated by Townsend, with a preface by Grove (London, 1882), the standard work; Nohl, *Life of Mozart*, translated by Lalor (Chicago, 1893), an excellent short biography; *The Great German Composers* (New York, 1878); Köchel's *Chronologisch-thematisches Verzeichnis sämtlicher Tonwerke W. A. Mozart's* (Leipzig, 1862; suppl. 1889); *Letters*, translated from the collection of Ludwig Nohl by Lady Wallace (Boston, 1864).

MOZDOK, mōz-dōk'. A town in the Caucasian Territory of Terek, Russia, situated on the left bank of the Terek, 58 miles north of Vladikavkaz (Map: Russia, F 6). It has a number of Armenian and Greek churches, of which that of the Assumption attracts many pilgrims. The educational institutions include four Mohammedan schools. Gardening and the manufacturing of wine and spirits are the chief occupations. The town was founded in 1762. Population, in 1897, 14,583, consisting chiefly of Kabardins, Georgians, and other Caucasian tribes, Armenians, and about 4000 Russians.

MOZIER, mō'zhēr, JOSEPH (1812-70). An American sculptor. He was born at Burlington, Vt., August 22, 1812, and in 1831 settled in New York, where he established himself as a merchant. In 1845 he retired from business to devote himself to art, and shortly after went to Italy. He studied sculpture for several years at Florence, and then went to Rome, where he spent the greater part of his professional career. Among his best works are: "Esther;" the "Wept of Wish-ton-Wish;" "Tacite" and "Truth" in the Mercantile Library, New York; the "White Lady of Avenel" (1866); "The Peri;" "Pocahontas;" the "Prodigal Son," Philadelphia Academy; and "Rizpah," one of his latest works. He died at Faids, Switzerland, October, 1870.

MOZLEY, mōz'li, JAMES BOWLING (1813-78). An English clergyman. He was born at Gainsborough, Lincolnshire, and was sent in early youth to school at Grantham. In 1830 he was admitted to Oriel College, where he came into intimate association with the leaders of the Oxford Movement—Newman, Pusey, Keble, and Hurrell Froude. With this movement he became formally allied, though he was never among the more dogmatic of its promulgators. In 1834 he took his degree, and shortly thereafter won the Chancellor's prize for an English essay on *The Influence of Ancient Oracles on Public and Private Life*. He remained at Oxford, studying theology under the direction of Pusey and Newman, as fellow of Magdalen, until 1865, during which period he contributed, first to the *British Critic* and later to the *Christian Remembrancer*, articles suggested by the Church movement of the time. He was in full accord with Anglican teachings until the Gorham controversy of 1850 on the subject of baptism led him to attempt a reconciliation of the Christian tradition about baptism with the teachings of Calvinistic theology. His contributions to this subject were: *A Treatise on the Augustinian Doctrine of Predestination* (1855); *The Primitive Doctrine of Baptismal Regeneration* (1856); and *A Review of the Baptismal Controversy* (1862). He removed from Oxford on his marriage in 1856, and became rector of Old Shoreham, Sussex. In 1869 Gladstone appointed him Canon of Worcester, and two years later nominated him regius professor

of divinity at Oxford, which post he held until his death. In addition to the works already mentioned, he published his Bampton Lectures on *Miracles* (1865) and *Ruling Ideas in Early Ages* (1877). His letters, with biographical introduction, were edited by his sister (London, 1884).

MOZLEY, THOMAS (1806-93). An English clergyman and journalist. He was born at Gainsborough, and attended Charterhouse School. In 1825 he entered Oriel College, Oxford. He became fellow of Oriel, and enjoyed the intimate friendship of the leaders of the Oxford Movement, the personal side of which he has given in his *Reminiscences, Chiefly of Oriel College and the Oxford Movement* (1882). In 1831 he entered the active ministry, but returned to Oriel in 1835 to assume the office of junior treasurer. In 1836 he resigned his fellowship, and became rector of Cholderton, Wiltshire, where he remained eleven years, varying his pastoral duties by writing for the *British Critic*. In 1841 he succeeded Newman as editor of that journal. In 1844 he began writing for the *Times* (London), and in 1847 he resigned his living and removed to London, formally entering upon a long literary career. Once again, in 1868, he returned to the work of the Church, but the following year found him in Rome as correspondent for the *Times*. From 1880 to 1893 he resided at Cheltenham, engaged in literary pursuits.

MOZOOM'DAR, PROTAP CHUNDER (c.1840—). A Hindu reformer and theist. He was born at Calcutta, India; studied in the native college there; was led by conviction to join the Brahmo-Somaj (q.v.), and became the editor of the *Theistic Quarterly Review* and the *Interpreter*, published in Calcutta in the interests of the association. In 1874 he visited England, and in 1883 the United States, where he was welcomed by the leading men of several Christian denominations. During his stay he published a book entitled *The Oriental Christ*, and on his second visit he read a paper before the World's Parliament of Religions on the *Brahmo-Somaj*, published in Chicago, 1893. He is the author of the *Life and Teachings of Keshub Chunder Sen* (1887), and has contributed also to British and American periodicals.

MOZYĖ, mō-zēr'. A town in the Government of Minsk, Russia, situated on the right bank of the Pripet, 204 miles southeast of Minsk (Map: Russia, C 4). It manufactures leather, beer, and hardware, and trades in grain, animals, and lumber. Population, in 1897, 10,762, including about 5000 Jews.

MPONGWE, m'pōn'gwé. A Bantu-speaking people living about the Gabon estuary, in French equatorial Africa. Formerly powerful, they have been broken up by the movements of other tribes, especially by the Fans. Missionary work has been carried on among the Mpongwe for a long time, and their language, which has been reduced to writing through these efforts, is peculiarly rich, so that it has been adopted by neighboring tribes, and thus forms a trade language. The Mpongwe are above the average height and well developed; their hair is woolly, and the skin of light chocolate color. In character they are boastful and indolent. Agriculture and trading are their chief pursuits. As merchants they are untrustworthy, being known

as clever swindlers. The political unit is the clan, ruled over by the head men. The so-called king is chosen from the head men by lot in a solemn conclave, and is reviled and mistreated before being proclaimed.

In arts the Mpongwe are at a low level. They are said to cook their food by boiling it in earthen vessels, apparently not being familiar with the method of roasting. As canoe-makers they are skillful, and are admirable boatmen. The canoes, usually 60 feet long, are hollowed out by fire and transported often several miles to water. Around the stations the Mpongwe are nominally Christians, but the isolated natives retain their pagan religion, with its fetish idols, charms, and belief in witchcraft.

MRICCHAKATIKA, *mrich'a-kā'tē-kā'* (Skt. *mṛcchakatikā*, clay cart). The title of a Sanskrit play of the sixth century attributed to a king named Sudraka, but probably written for him by the poet Dandin (q.v.). The play, which is in ten acts, is one of the most exquisite of all the Sanskrit dramas. The scene is laid at Ujjain (q.v.), and its central theme is the noble love of the rich courtesan Vasantasena for a merchant named Carudatta, who has been reduced to poverty. Pursued by Sansthanaka, the King's brother-in-law, Vasantasena seeks refuge in Carudatta's house, and the pair fall in love. Escorted to her home by the merchant, she leaves her jewels with him on the pretext that she dares not keep them about her. The gems are stolen by a Brahman who is in love with Vasantasena's maid, the soubrette of the play. When Carudatta perceives this loss, he and his wife sell all that remains to them and thus make good the treasure; but the Brahman, on the advice of his sweetheart, surrenders the stolen jewels to their owner, and Vasantasena thus discovers the depth of Carudatta's love for her. In the merchant's home she sees his little son weeping because he can have but a clay cart, while a neighbor's child has one of gold. She heaps the toy full of jewels for him, and this incident, one of true pathos, gives the play its name. Again pursued by the brother-in-law of the King, she repulses him. Enraged, he chokes her into insensibility, and leaves her for dead, covering her with leaves. She is, however, discovered and revived by a Buddhist monk whom she had saved from a gambling quarrel. Sansthanaka accuses Carudatta of Vasantasena's murder. He is condemned and led forth to execution. Just as the sword is raised, Vasantasena appears, her lover is saved, and, as polygamy is possible in the Hindu drama, the lovers are united. As a picture of Hindu life of the period, luxurious and corrupt, but with noble and unselfish motives, the *Clay Cart* is of great value. The *Mricchakatika* has been edited by Stenzler (Bonn, 1847), Godabole (Bombay, 1896), Vidyasagara (Calcutta, 1898), and Parab (Bombay, 1900). It has been translated into German by Böhtlingk (Saint Petersburg, 1877), Fritze (Chemnitz, 1879), and Kellner (Leipzig, 1894); into Dutch by Vogel (Amsterdam, 1897); and into English by Wilson in his *Select Specimens of the Theatre of the Hindus* (3d ed. London, 1871). Consult Lévi, *Théâtre Indien* (Paris, 1890).

MUCH ADO ABOUT NOTHING. A comedy by Shakespeare, produced in 1597-98 and printed in 1600. It was probably a recast of *Love's Labour's Won* (1590), and was known as *Bene-*

dick and Beatrice (1613). The story of Hero and Claudio is taken probably from the tale of "Ariodante and Ginevra" in Ariosto's *Orlando furioso*, which was translated by Beverly, and dramatized as *Ariodante and Ginevra* (1582). It is found also in Bandello's novels, and in a German play by Jacob Ayer, *The Beautiful Phœnician* (1596). This contains some features not in the novel but used by Shakespeare, pointing to some unknown intermediate source. Otherwise the comedy is quite original, especially the inimitable Dogberry.

MUCILAGE (Lat. *mucilago*, moldy, musty juice, from *mucere*, to be moldy, from *mucus*, slime; connected with Gk. *μύκα*, *myka*, slime, Lat. *mungere*, to blow the nose, Skt. *muc*, to release). A name applied to aqueous solutions or jelly-like preparations of vegetable gums or of dextrin (qq.v.). An excellent mucilage is made by dissolving gum arabic in hot water, filtering the solution and adding some antiseptic, to prevent fermentation and the formation of mold. The United States Pharmacopœia contains four mucilages, including *Mucilago acaciæ* and *Mucilago tragacanthæ*.

MUCIN. See MUCOUS MEMBRANE.

MUCIUS SCÆVOLA, *mū'shi-ūs sēv'ō-lā*. See PORSENA.

MÜCKE, *mük'e*, HEINRICH (1806-91). A German historical painter, born at Breslau, pupil of Schadow, first at the Berlin Academy, then at Düsseldorf, whither he had followed him. In 1829 he painted with Lessing in Castle Heltorf, near Düsseldorf, a cycle in fresco of episodes in the life of Frederick Barbarossa, and after a visit to Italy in 1833 executed a series of religious and historical paintings, chief among which were: "Saint Catharine Borne by Angels to Mount Sinai" (1836), a composition of which he subsequently had to paint five replicas, "Saint Elizabeth Distributing Alms" (1841), both in the National Gallery, Berlin; "The Virgin and Child, with David, Saint John, and Saint Aloysius," a large fresco in Saint Andrew's Church, Düsseldorf; "Chriemhilde's Dream;" "Saint Ambrose and Emperor Theodosius at Milan;" "Introduction of Christianity into the Wupper Valley," fresco in City Hall, Elberfeld; and a cycle depicting the "Life of Saint Meinrad, Count of Zollern," at Sigmaringen.

MUCKERS (Ger. *Mucker*, sulky person, hypocrite, from MHG. *muckzen*, *muchzen*, from OHG. *muckazzen*, to mutter; probably connected with OIr. *for-muigthe*, hidden). The popular but opprobrious name, meaning that they were hypocrites, of an extraordinary sect which sprang up at Königsberg, in Germany, in 1835. The movement seems to have originated in the dualistic and Gnostic views of John Henry Schönherr (who was born at Memel, in 1771, and died at Königsberg in 1826) concerning the origin of the universe by the combination of two spiritual and sensual principles. His followers carried out his system much more completely than himself. The most notable of them were two clergymen, Johann Wilhelm Ebel and Georg Heinrich Diestel, the former an archdeacon, who founded a society to which women—some of noble birth—attached themselves. Scandal was thereby caused, and Ebel's easily misunderstood expressions as to the proper relations of the sexes were made the basis of charges against his chas-

tity and moral influence. His followers were accused of the grossest immorality, and a garden in Königsberg where they met acquired the name of the Seraph's Grove. The subject was brought before the courts (1839-42), and the result was that Ebel and Diestel were degraded from their offices, and the latter was further punished by imprisonment. But the sentence was dictated by strong prejudice against the accused, on account of their religious views and peculiar eccentricities, and the evidence gives no support whatever to the charge of licentiousness. The matter was revamped without proper examination by W. Hepworth Dixon in his *Spiritual Wives* (London, 1868), and thus rendered familiar to English readers. For the facts consult J. I. Mombert, *Faith Victorious*, a life of Ebel (New York, 1882).

MUCORA/CEÆ (Neo-Lat., nom. pl., from Lat. *mucor*, mold, from *mucere*, to be moldy, from *mucus*, slime; connected with Gk. *μῦς*, *mys*, mucus, Skt. *muc*, to release). A widely distributed order of fungi mostly microscopic, comprising what are commonly known as molds, which are found on decaying vegetable and animal matter. *Phycomyces nitens* grows on greasy substances, a habitat not usual with most fungi. *Mucor mucedo*, one of the most common, appears as a glistening mass of mycelium on fresh horse manure in moist places. It seems to flourish in decaying nitrogenous matter, evolving ammonia. From the mycelium there project toward the light slight white threads (conidiophores), whose tips soon became black, from the developed spores. The spore stalks of the common bread mold appear to be indifferent to light. If the mycelium be kept moist it develops cross-partitions which increase in number, the cells so produced swelling into a spherical form to become thick-walled resting spores; but if grown in a decoction of horse manure the mycelium bears only conidia. The principal genera are *Mucor*, *Thamnidium*, *Pilobolus*, *Phycomyces*.

MUCOUS MEMBRANE and MUCUS. The mucous membrane is continuous with the skin at all the orifices of the body, and lines the passages by which the internal organs communicate with the outer world. For convenience of description it may be divided into three great tracts—the alimentary mucous membrane, the respiratory mucous membrane, and the genito-urinary mucous membrane.

The *alimentary mucous membrane* commences at the lips, and not only forms the inner lining of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these glands, and constitute their true secreting element. Besides these larger offsets, we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described in the article **DIGESTION, ORGANS OF**.

The *respiratory mucous membrane* begins at the nostrils, and under the name of *Schneiderian* or *pituitary membrane* (see **NOSE**) lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backward, through the posterior nares (the com-

munication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts some writers describe them as a single one, under the name of the *gastro-pulmonary tract*.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. In the female it becomes continuous with the serous membrane of the abdomen at the fimbriæ of the Fallopian tubes. See **KIDNEY**.

Mucous membranes line all those passages by which internal parts communicate with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule they are soft and velvety, and of a more or less red color, from their great vascularity; but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of epithelium (q.v.) resting on a thin, transparent, homogeneous membrane, which from its position is termed the basement membrane, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles or glands, or both. The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastro-intestinal mucous membrane. The mucous membranes constitute the medium through which nearly all the material changes are effected that take place between the living organism and the external world. Thus in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; while the villi, which are closely set upon the surface of the small intestine, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. The same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandulæ in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. Again, the bronchio-pulmonary or respiratory mucous membrane serves for the introduction of oxygen from the air, and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are eliminated from the blood. Although the various kinds of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the se-

cretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed is secreted in very considerable quantity. (See CATARRH.) The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, it has other uses, among which two may be especially mentioned: (1) It communicates to the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions; and (2) it serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the *mucin*, which forms from 2.4 to 9 per cent. of nasal and bronchial mucus. This mucin contains 12.64 per cent. of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste, and faintly alkaline in reaction, and hence its constant presence in the mouth gives rise to no disagreeable sensation.

MUCUNA. A genus of leguminous plants. See COWAGE; LUMBRICOID.

MUD'AE (Hind. *madār*, from Skt. *mandāra*, coral-tree), *Calotropis*. A genus of East Indian shrubs of the natural order Asclepiadaceæ. The bark of the root and the thick milky juice of some species are used in the East, where they have long been credited with alterative, purgative, emetic, and sudorific properties which have attracted some attention from European physicians. Mudar is a very common and often troublesome weed in India. The commonest species, *Calotropis gigantea*, a large shrub, with stems often thicker than a man's leg, and broad, fleshy leaves, rapidly attains a large size on very dry sands, where almost nothing else will grow. The short, not easily spun, silky down of the pods is used for making floss and a soft, cotton-like thread, but a strong fibre, useful for cordage and fishing-lines, is obtained from the inner bark. When properly prepared it is especially well adapted to mix with various other fibres, especially silk. The thick, milky juice, collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.

MUD-CAT. See CATFISH.

MUD-EEL. A siren. See MUD-PUPPY.

MUDFISH. A name given to several widely different fishes which frequent muddy waters. (1) In the United States, the bowfin (q.v.). (2) In California, a small marine goby (*Gillichthys mirabilis*) which lives in shallow places that are left bare at low tide, and harbors in excavations made by itself in the mud. (3) One of the killifishes (q.v.), the mummichog, or 'mud-dabbler.' (4) Any of the lungfish or dipnoans, especially the rare *Lepidosiren paradoxa* of Brazilian swamps. (See DIPNOI, and Plate of DIPNOI AND CHIMÆRA.) This is a salamander-like creature which grows to a length of four feet or more, has the dorsal, caudal, and anal fins united into one continuous fin, and the pectoral and ventral fins produced into long jointed filaments. The head is conical, eye small, gill openings without covers, mouth small, and teeth pointed and

cusped, adapted to crushing the fresh-water snails (chiefly Ampullaria) upon which it feeds. A closely related West African fish (*Protopterus annectans*), sometimes six feet long, is very abundant in the Gambia River, where it sustains a torpid existence during the dry season by burying itself in the mud, forming a sort of nest or 'case' of hardened mud about it. Many specimens have been dug out and sent, each within its clod, to Europe, and kept alive in zoological gardens. They grow rapidly, are active and voracious the year round, when kept in tanks in hothouses feed upon flesh and all sorts of small animals, and frequently eat each other. In the wet season they swim and crawl about the muddy rivers they inhabit, and are sought as food by the natives. They are nocturnal and frequently rise to the surface to breathe. Their breeding habits are little known, but they are believed to be ovoviviparous. The young have external gills. Consult Lydekker, *Royal Natural History*, vol. v. (London, 1895).

MUDFORD, WILLIAM (1782-1848). An English writer, who as editor of the London *Courier*, for a time the rival of the *Times*, exerted great influence on public opinion. Leaving the *Courier*—which declined in influence after his withdrawal, and presently was discontinued—he became editor and proprietor of the *Kentish Observer*, the organ of the Conservative Party in Kent. In 1841 he succeeded Theodore Hook as editor of *John Bull*. To *Blackwood's Magazine* he contributed many essays and tales, afterwards collected in part. Among his published volumes are *A Critical Enquiry into the Writings of Dr. Samuel Johnson* (1803); *Nubilia in Search of a Husband* (1809); *The Contemplatist*, essays (1811); *An Historical Account of the Campaign in the Netherlands in 1815* (1817); and *Tales and Trifles from Blackwood's* (1849).

MUDGE, ENOCH (1776-1850). The first Methodist minister raised in New England. He was born at Lynn, Mass., was converted under Jesse Lee, the pioneer of Methodism in New England, and entered the ministry in 1793. He labored as an itinerant preacher in Maine until his health gave way, and in consequence he retired in 1799. He was twice chosen State representative and had much to do with the passage of the Religious Freedom Bill. In 1816 he resumed preaching. From 1832 to 1844 he was pastor of the Seaman's Chapel at New Bedford, Mass.—His son, THOMAS HICKS MUDGE (1815-62), was graduated at Wesleyan University (1840) and Union Theological Seminary (1843); he preached in New England, was professor of sacred literature in McKendree College, Lebanon, Ill. (1857-59), and held pastorates in Saint Louis and Baldwin City, Kan.—ZECHARIAH ATWELL MUDGE (1813-88), a nephew of Enoch, entered the ministry in 1840 and held various pastorates in Massachusetts. He wrote much in history and biography, including *Lives of Abraham Lincoln* (1867) and Roger Williams (1871), and histories of Plymouth (1869), Salem Witchcraft (1890), and Arctic voyages (2 vols., 1875).—JAMES MUDGE (1844—), nephew of Zechariah, was graduated at Wesleyan University in 1865, entered the ministry in 1868, served as missionary in India, and has held pastorates in New England. He is the author of *Growth in Holiness Toward Perfection* (1895); *The Best of Brown-*

ing (1898); *Honey from Many Hives* (1899); and other works.

MUD-HEN. A variant of 'marsh-hen,' some species of coot, gallinule, or rail (qq.v.).

MUD-MINNOW. A small, minnow-like fish of the family Umbridae, closely allied structurally to the pikes. They inhabit weedy streams, bogs, and ditches in the United States, and also in Austria, where they bury themselves in the mud. They are carnivorous, and extremely tenacious of life. Often when none can be seen in a pool, a swarm of these little dark green fishes may be aroused by raking through the mud. Two American species are known, the Eastern mud-minnow (*Umbra pygmaea*) and the Western 'dogfish' (*Umbra limi*).

MUD-PUPPY, or WATER-DOG. An American salamander of the family Proteidae, characterized by having four toes on each foot and persistent larval gills. This genus was formerly called Menobranchus. Two species inhabit the central parts of the United States, of which the more

A MUD-PUPPY.

common and widespread is *Necturus maculatus*. It reaches the length of one foot, is smooth, slimy, and brown-blotched, with the tufted gills dark red. These creatures remain mostly among weeds or rocks at the bottom of the water during the daytime, but at night they move about, often with quick eel-like motions (a local name is 'mud-eel'), in search of crayfish, worms, insects, frogs, etc. They spawn in April or May. Other salamanders are sometimes given the same name, especially the 'axolotl' (q.v.).

MUD-SHAD. A useless shad-like fish (*Dorosoma cepedianum*), called also 'gizzard' and 'hickory' shad, which is abundant all along the coast from Cape Cod to Mexico, and also throughout the Mississippi Valley. It grows to a length of about 15 inches, and is bluish silvery, the young having a round dark spot at the shoulder.

MUDSKIPPER. One of the curious little fishes (three to four inches long) of the goby family and genus *Periophthalmus*. They are sometimes called 'jumping fishes' or 'leaping fishes,' and abound on the coasts of West Africa,

A MUDSKIPPER.

the Red Sea, Indian Ocean, and eastward to Japan. Their remarkable peculiarity is that they will leave the water to visit every place washed by the surf. By the aid of the pectoral and ventral fins and the gill covers, these fishes

skip across the damp sand, ascend the roots of mangroves, and run up wet rocks in quest of flies. They are, says Day, essentially mud-dwelling fishes, dark brown in color, and if placed in a vessel of deep clear water will drown. This amphibious power of these fishes has been acquired without any essential change in the character of the gills; but the fish is in the habit when out of water of puffing out its cheeks with air, which is held for a short time and then renewed. Consult: Day, *Fishes of India* (London, 1878); Semper, *Animal Life* (New York, 1881).

MUD-SUNFISH. A small bass (*Acantharchus pomotis*) of little value as food, numerous in sluggish coastal streams from New York to South Carolina. It is dark green in color, with five indistinct blackish stripes lengthwise, and a black opercular spot.

MUD-TORTOISE, or MUD-TURTLE. A dark-brown turtle (*Cinosternum Pennsylvanicum*) with light dots on the head, found from Canada to Texas. See TERRAPIN.

MUD-WASP, or MUD-DAUBER. Any one of a group of wasps belonging to the old genus *Pelopæus*, now *Sceliphron*. They build nests of mud in sheltered places, choosing the cracks of a barn or fence or some sheltered place under the eaves of any wooden building, entering also disused rooms in houses, and sometimes even rooms that are in daily use. The nests consist of a varying number of mud cells placed side by side, usually in a single row, but sometimes in several rows. The cells before completion are packed with a food supply for the future young, and this consists almost invariably of spiders, as many spiders being placed in one cell as the cell will hold. A single egg is laid upon the last spider which has been placed in the cell, and the larva hatching from the egg eats rapidly, consuming the abdomens of the spiders first and subsequently the remainder of their bodies. All of the spiders which have been placed in the cell have been stung and paralyzed by the parent wasp, but many of them are not really dead when the larva reaches them. After the egg is laid and the nest is closed up, new cells are constructed by the same female. The mud or clay with which the nests are constructed is brought in little balls by the aid of the wasp's mandibles, and 20 or more visits are required to complete one cell; so that for the construction of a large nest of 50 cells about 1000 visits must be made by the insect. The larva reaches full growth in a short time, usually ten days or two weeks, and forms a cocoon within the mud cell, the winter being passed in the cocoon, although there may be two or more summer generations, in which case the summer pupal period is short. The group is a large one, and mud-wasps are common not only in America and in Europe, but in India and Australia. Consult: Fabre, *Insect Life* (London, 1901); Sharp, *Cambridge Natural History*, vol. vi. (London, 1901); Howard, *The Insect Book* (New York, 1902). See also the article WASP and its bibliography.

MUEZZIN, or MUED'DIN (Ar. *mu'adh-dhin*, one who calls to prayer, from *'adhdhana*, to call to prayer, from *'adhina*, to hear). The Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (*'adhan*) consists

of these words, repeated at intervals: "Allah is great [four times]. I testify that there is no God but Allah [two times]. I testify that Mohammed is the apostle of Allah [two times]. Come to prayers [two times]. Come to salvation [two times]. There is no god but Allah." The Shiites also say "Come to good works," and "Prayers are better than sleep" is added before the early morning prayer (*fajr*). Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. In small mosques the *'adahn* is chanted by the imam, and, when the mosque is provided with a minaret, the muezzin ascends it for his chant; in smaller mosques, the chant is made at the side. The office of muezzin is considered a meritorious one, and insures the holder's admission into Paradise.

MUFTI, müftî (Ar. *mufti*, expounder of the law). The name of a Mohammedan official who expounds the law according to the Koran and traditions; according to his decision, delivered in a memorandum called a *fatwa*, the *cadi*, or judge, decides the case. In Turkey the *Grand Mufti*, or *Sheikh ul-Islam*, is the head of the Moslem Church, and is appointed by the Sultan. He is the supreme chief of the ulemas or body of Mohammedan theologians. His *fatwa* is extremely powerful, even under certain circumstances may depose the Sultan. The title *mufti* is also applied to juris-consults attached to local government councils in the Turkish Empire, but the power of the *mufti*, with the exception of the *Grand Mufti*, is largely nominal.

MÜGGE, mwg'ge, THEODOR (1806-61). A German novelist, born and educated in Berlin. His liberal sentiments, expressed in various newspapers and in such pamphlets as *Die Censurverhältnisse in Preussen* (1845), led in several instances to his arrest and prosecution. During the twenty years preceding his death he wrote numerous sketches, tales, novels, and romances, which appeared in a complete edition in 1862-67 (33 vols.). Several, including *Toussaint* (1840) and *Afräja* (1854), have been translated into English by E. J. Morris. The most interesting of his writings are his Norwegian romances and sketches of travel: *Leben und Lieben in Norwegen* (1858); *Skizzen aus dem Norden* (1844); and *Nordisches Bilderbuch* (1858; 3d ed. 1862).

MUGGER. This, the common 'marsh-crocodile' of India and the Malay Islands (*Crocodilus palustris*), is not often more than 12 feet in length. Its head is rough, with a thick and rather broad snout, and each jaw contains 19 teeth on each side. It inhabits rivers, ponds, tanks, and marshes, and goes ashore only when it is obliged to move into some new water by the drying up of its pond, or wishes to bury its eggs in the sand. In extreme drought, however, it buries itself in the mud and remains dormant until the coming of the rains. This is the crocodile which is venerated by the Hindus and is kept in a half-domesticated condition in certain ponds, attended by fakirs, who worship in a neighboring temple of their cult. Consult: the writings of Indian naturalists, especially Adams, *Wanderings of a Naturalist in India* (Edinburgh, 1867); Tennent, *Natural History of Ceylon* (London, 1861); Hornaday, *Two Years in the Jungle* (New York, 1885).

MUGGLETONIANS. A sect that arose in London about the year 1651. The founders were two cousins, John Reeve (1608-58) and Lodowicke Muggleton (1609-98), obscure journeymen tailors, but claiming to have the spirit of prophecy. Muggleton professed to be the 'mouth' of Reeve, as Aaron was of Moses. They affirmed themselves to be the two witnesses of Revelation xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. A few members of the sect still exist. They deny the doctrine of the Trinity; hold anthropomorphist opinions; and to all this add many strange doctrines of their own, as that the devil became incarnate in Eve, etc. Consult: Gordon, "The Origin of the Muggletonians," and "Ancient and Modern Muggletonians," in the *Transactions of the Liverpool Literary and Philosophical Society* for 1869-70.

MUGWOBT. 'A popular name for various species of artemisia (q.v.).

MUGWUMP (Algonquin *mugquomp*, chief, great man). In American politics, a term originally applied to a voter nominally identified with a particular party, but claiming the right to vote with another party. It early passed into the local phraseology of some of the New England villages, being applied in its original (Indian) signification to any local magnate. Its first appearance in print seems to have been in the *Indianapolis Sentinel* in 1872. Its popular use began with an article in the *New York Sun* for March 23, 1884. In September of the same year it was first given to a political party, the Independent Republicans, who refused to ratify the nomination of James G. Blaine for the Presidency. The name was applied to them in a spirit of derision, but was accepted by them, and now regularly denotes any body of voters who profess to be independent of strict party obligations. The name Dudes and Pharisees was also applied in 1884 to those Republicans who opposed the election of James G. Blaine.

MUHARRAM (Ar. *muḥarram*, sacred, from *ḥarama*, to forbid). The first month of the Mohammedan year. Originally the Arabs had a solar year by means of intercalary months. The first month was called *Ṣafar I.*, and came in the autumn. It was the month of fairs, pilgrimages, and festivals, and hence acquired the epithet *al-Muḥarram*, the sacred, which in time supplanted the real designation. When in the year 10 of the Hejira Mohammed restored the lunar year, on the ground that intercalary months were an impious interference with the order of things as established by God, Muharram and all the months began to come earlier in each succeeding year. Mohammed is said to have observed the tenth day of Muharram (the '*ashūrā*') as a fast day, perhaps in imitation of the Jewish Day of Atonement on the tenth of Tishri. Later he appointed the month of Ramadan (q.v.) for fasting. The Sunnites still consider the tenth of Muharram as sacred, and keep it as a fast. The Shiites lament the death of Hosein on the first ten days of the month. (See *HASAN AND HOSEIN*.) Consult Wellhausen, *Reste arabischen Heidenthums* (Berlin, 1897).

MÜHLBACH, mül'bag, LUISE. The assumed name of Klara Mundt (1814-73). A German

author, born in Neubrandenburg. Her work, consisting mostly of historical novels, is sensational, inartistic, distorted, but it shows a talent for lively description and narration that gave her a wide but short-lived popularity. *Friedrich der Grosse und sein Hof* and many others of her novels have been translated into English.

MÜHLBERG, mül'bĕrk. A town in the Province of Saxony, Prussia, on the Elbe, 35 miles northwest of Dresden (Map: Prussia, E 3). It is famous as the scene of a battle in 1547, which resulted in the defeat of the Protestants under John Frederick I., Elector of Saxony, by the Emperor Charles V., and the triumph of the Catholics in Germany. Population, in 1900, 3463.

MÜHLEISEN-ARNOLD, mül't-zen är'nold, JOHN (1817-81). An English clergyman, missionary, and author, born at Zell (Württemberg). He was educated in Germany, and after his removal to England was successively missionary of the Church Missionary Society in India and Abyssinia, chaplain to the Bishop of Gibraltar, and chaplain to Saint Mary's Hospital, Paddington, London (1852-61). In 1859 he founded the Moslem Mission Society in England. He was chaplain of East Ham, Essex, from 1861 to 1865, consular chaplain at Batavia, Java, from 1865 to 1871, and rector of Saint Mary's Church, Papendorf, Cape Town, South Africa, from 1876 until his death. His publications include: *Ishmael: or, A Natural History of Islamism* (1859); *English Biblical Criticism, and the Authorship of the Pentateuch, from a German Point of View* (2d ed. 1864); and *Genesis and Science, or, The First Leaves of the Bible* (2d ed. 1875).

MUHLENBERG, mü'len-bĕrg, FREDERICK AUGUSTUS CONRAD (1760-1801). An American clergyman and politician, son of Heinrich Melchior Muhlenberg. He was born at New Providence (now Trappe), Montgomery County, Pa., studied in Germany at the University of Halle, and upon his return to America entered the Lutheran ministry in Pennsylvania. In 1773 he became pastor of the Lutheran Church in New York City. He was an ardent patriot, and in 1776 he quitted New York and returned to his native State, at the same time abandoning the work of the Church for political activity. He was repeatedly elected to Congress. The first session of the House of Representatives in Washington's administration chose him as Speaker. He was also made chairman of the Committee of the Whole in 1795, and cast the deciding vote that saved the Jay Treaty.

MUHLENBERG, GOTTHILF HEINRICH ERNST (1753-1815). An American clergyman and botanist, son of H. M. Muhlenberg, born at Trappe, Pa. He was educated at Halle and traveled in Germany and in England. He was ordained a Lutheran minister and became assistant pastor of a Lutheran church in Philadelphia. In 1779 he retired to the country, where he devoted himself to the study of botany; and it is as a botanist that he is best known. His chief works are: *Catalogus Plantarum Americae Septentrionalis* (1813); and *Descriptio Uperior Graminum et Plantarum Calamariarum Americae Septentrionalis Indignarum et Circarum* (1817).

MUHLENBERG, HEINRICH MELCHIOR (1711-87). The founder of American Lutheranism. He

was born at Eimbeck, Prussia, September 6, 1711. His parents were Saxon, but having suffered greatly in the Thirty Years' War, removed to Eimbeck. The death of his father in his twelfth year threw the family into poverty and occasioned an interruption of his studies, and till his twenty-first year he toiled incessantly to assist in the support of the family. In 1735 he entered the University of Göttingen, where he remained three years. Graduating at Göttingen, he went to Halle in 1738, where, besides studying, he taught in the orphan house. He associated intimately with Francke, Cellarius, and Fabricius. Soon after his ordination application came to Germany from Pennsylvania for some one to be sent to labor among the destitute Lutherans of that colony. The faculty immediately selected Muhlenberg, who was then in his thirty-first year. He accepted the appointment, and the better to qualify himself went to London, where he acquired facility in the use of English. He reached America in 1742, to the great joy of the German Christians. His arrival marked a new era in the history of the Lutheran Church in the United States, its condition gradually improved, and frequent accessions were made to the ranks of the ministry of men educated at Halle and thoroughly devoted to their work. He took the pastoral care of the associated churches of Philadelphia, New Hanover, and New Providence (now Trappe, some 25 miles northwest of Philadelphia), which had united in calling a minister, and these three congregations were the principal scenes of his ministerial labors. The first three years of his ministry he resided in Philadelphia, the next sixteen in New Providence. In 1761 he removed to Philadelphia, but in 1776 went back to New Providence. During the War of the Revolution his sympathy with the colonists excited great opposition, and his life was often in peril. Consult his autobiography to 1743' (in German) edited by Germann (Altoona, 1881), and his *Life* by Mann (Philadelphia, 1887), and Frick (Philadelphia, 1902); also Oschsenford, *Muhlenberg College, a Quarter-Centennial Memorial Volume* (Allentown, 1892).

MUHLENBERG, JOHN PETER GABRIEL (1746-1807). A Lutheran preacher and leader in the Revolutionary War, son of Heinrich Melchior Muhlenberg (q.v.). He was born at Trappe, Pa., October 1, 1746, and sent to the University of Halle to be educated, but ran away, and passed a year as a private in the dragoons. Returning to America, 1766, he studied for the Lutheran ministry; was called to Virginia, 1771; to have a legal standing as a clergyman there, went to England, 1772, and was ordained by the Bishop of London; in same year was settled at Woodstock, Va. Soon after the beginning of the Revolutionary War, he told his congregation that there was a time to preach and a time to fight, and at the close of the services he threw off his gown, showing himself in full uniform, and read from the pulpit his commission as colonel. He had the drummers strike up for volunteers, and many of his congregation volunteered and joined his regiment, the Eighth Virginia, popularly known as the German regiment, afterwards noted for its courage and good discipline. In 1774 he was a member of the House of Burgesses, and served on the committee of safety, and two years later he sat in the State convention. He partici-

pated in the fighting at Charleston in 1776, and was made brigadier-general the following year, and placed in command of the Virginia line. He took part in the battles of the Brandywine, Germantown, and Monmouth, and in the capture of Stony Point. He defended Virginia against the expeditions of Leslie and Arnold, and was commander-in-chief there till the arrival of Steuben. Upon the invasion of Virginia by Cornwallis, he was next in command to Lafayette, and at the siege of Yorktown he was in command of the first brigade of light infantry. He retired at the close of the war with the rank of major-general. Soon after, he settled in Pennsylvania. He served in Congress in 1789-91, 1793-95, and 1799-1801. In the latter year he was chosen United States Senator, but resigned when Congress met to become Supervisor of Revenue for the District of Pennsylvania, and in 1803 he was appointed Collector of the Port of Philadelphia, in which position he died near Philadelphia, October 1, 1807. Consult his *Life* by his great-nephew, Henry A. Muhlenberg (Philadelphia, 1849).

MUHLBERG, WILLIAM AUGUSTUS (1796-1877). An American Episcopal clergyman and philanthropist, grandson of H. M. Muhlenberg. He was born in Philadelphia, and graduated at the University of Pennsylvania in 1814. Three years later he was ordained deacon, and served as assistant to Bishop White at Christ Church, Philadelphia. Ordained priest in 1820, he was rector from 1821 to 1828 of Saint James's Church, Lancaster, Pa., where he helped to establish the first public school in the State outside of Philadelphia. He founded in 1828 at Flushing, L. I., a school afterwards known as Saint Paul's, of which he was principal until 1846. Then he was rector of the Church of the Holy Communion in New York until 1858, in the latter year becoming superintendent and pastor of Saint Luke's Hospital, which he had founded. In the later years of his life he was instrumental in establishing an industrial Christian settlement at Saint Johnland, L. I. He died in Saint Luke's Hospital, April 8, 1877. To trace his effect upon his time would be to record the origin of several of the most important movements within the Episcopal Church. Thus he made his New York parish the first free-seat church of his communion in America; he organized the first sisterhood within the same limits in 1845, known as the Sisterhood of the Holy Communion; and the important later developments in the direction of Christian unity (see **EPISCOPAL CHURCH**) and of liturgical enrichment and flexibility both really grew out of his memorial to the House of Bishops in 1853. Church music and hymnody also owe much to him; he published three books in this department; but his most important literary work is contained in *Evangelical Catholic Papers* (1875-77). For his life, consult biographies by Ayres (New York, 1880) and Newton (ib., 1890); also Coleman, *The Church in America* (ib., 1896).

MUHLBERG COLLEGE. A collegiate institution at Allentown, Pa., under the control of the Evangelical Lutheran Church, incorporated in 1867. It consists of a preparatory and a collegiate department, the latter with classical and scientific courses leading to the degrees of B.A. and B.S. The total attendance in 1902 was 137. The faculty numbered 13. The college library contained 12,000 volumes. The campus of five

VOL. XIV.—7.

acres and the college buildings were valued at \$100,000. In 1902 a new site of 52 acres was purchased, on which new buildings were begun, at an estimated cost of \$200,000. The income for the year was \$16,764, and the endowment was \$163,977.

MÜHLHAUSEN, mül'hou-zen. A town in the Province of Saxony, Prussia, on the Unstrut, 30 miles northwest of Erfurt (Map: Prussia, D 3). It is an old town with a number of churches, of which that of Saint Blasius dates from the twelfth century, and a mediæval Rathaus. It is surrounded with modern suburbs and has a gymnasium, a seminary for teachers, and a theatre. There are manufactures of woolen and linen goods, carpets, leather, and cigars. The city has considerable trade in cattle, grain, and fruit. Population, in 1890, 27,400; in 1900, 33,433. Mühlhausen appears in history as early as 925, when it was a fortified post. It rose to importance as a free city in the fourteenth century, and in the Peasants' War was the headquarters of the Anabaptist leader, Thomas Münzer, who was executed near Mühlhausen in 1525. The town was finally incorporated with Prussia in 1815.

MÜHLHEIM, mül'hīm. See **MÜLHEIM**.

MUIR, MÜR, JOHN (1810-82). An English Sanskrit scholar. He was born in Glasgow, and educated in the University of Glasgow and the East India School at Haileybury. He engaged in the civil service in British India, in 1829-53, and devoted himself to the study of the languages, history, and antiquities of India. In 1853 he retired from the service and devoted himself to the advancement of Oriental literature, especially in its bearing upon Christianity. In 1846 he offered to the University of Cambridge a prize of £500 for the best treatise on the errors of the Hindu systems of philosophy, and on expounding the principles of Christianity to learned natives of India; and he gave, in 1802, £5000 to the University of Edinburgh for the endowment of a professorship of Sanskrit and comparative philology. Muir did much to help the spread of Christianity among the Hindus. His most important work was *Original Sanskrit Texts on the Origin and History of the People of India, Their Religion and Institutions* (1858-70).

MUIR, JOHN (1838—). An American explorer and naturalist, born at Dunbar, Scotland. He studied at the Dunbar Grammar School and then emigrated to the United States, and entered the University of Wisconsin. After his graduation he began to explore the less known portions of the North American continent, devoting his attention particularly to the western coast and to Alaska, where the Muir Glacier is named in his honor. He published: *The Mountains of California*; *Our National Parks*; and a number of magazine articles on natural history; and edited *Picturesque California*.

MUIR, MATTHEW MONCRIEFF PATTISON (1848—). An English chemist. He was born and educated in Glasgow, studied at the University of Tübingen, and became fellow and prelector in chemistry at Gonville and Caius College, Cambridge. Muir did much to popularize modern chemistry. He published: *Qualitative Analysis* (1874); *Elements of Thermal Chemistry* (1885); *Practical Chemistry* (with Carnegie, 1887); *The*

Alchemical Essence and the Chemical Element (1894); *The Story of the Wanderings of Atoms* (1898); and *The Story of Alchemy* (1902).

MUIR, Sir WILLIAM (1819—). An English Orientalist. He was born at Glasgow; studied at the universities of Glasgow and Edinburgh, and in 1837 entered the Bengal civil service, in which he rose to high distinction. He became eminent as an Orientalist, was from 1876 to 1885 a member of the Council of India, and from 1885 to 1900 was principal of the University of Edinburgh. His publications include: *Life of Mahomet* (1858-61); *The Corān* (1878); *The Caliphate* (2d ed. 1893); and *The Mohammedan Controversy* (1897).

MUIR-MACKENZIE, mā-kēn'zi, MONTAGUE (1847—). An English barrister and law writer. He was educated at the Charterhouse School and Brasenose, Oxford, and was a fellow of Hertford College, Oxford (1874-88). In 1873 he was called to the bar, and he was secretary to Lord Chief Justice Coleridge for the four following years. Later he became recorder of Deal (1892), and a bencher of the Middle Temple (1894). His publications are upon technical subjects, such as *Bills of Lading*, *Judicature Acts*, *Laws of Registration*, and *Bankruptcy Acts*.

MUKADDASI, mōō'kā-dā'sē. See MOKAD-DASI.

MUKDEN, mōōk-dēn', or **MOUKDEN**. The capital of Manchuria and of the Province of Shing-king, situated in a fertile region near the Hun-ho, 110 miles northeast of Niu-chwang, its port (Map: China, F 3). It is surrounded by a brick wall and is divided into nine parts, of which the central contains the Imperial palace, the examination hall, and other administration buildings. The city is regularly and solidly built, but is of little architectural interest. It is the seat of a considerable industry, and will probably greatly increase in commercial importance with the completion of the Port Arthur-Harbin branch of the Trans-Siberian Railway, on which it will be a station. Mukden trades chiefly in agricultural products and fur, and is the seat of the administration of Manchuria. In the vicinity of the city are the tombs of the ancestors of the present reigning family of China. The population is estimated at 250,000. The city suffered greatly during the Boxer uprising of 1900.

MUKHTAR PASHA, mōōk'tār pā-shā', AH-MED (1832—). A Turkish general and administrator, born at Brusa, in Asia Minor. He was educated at the Constantinople military school, was rapidly promoted, and became successively professor and governor of the school. He served in the Crimean War, as a staff officer in the Montenegrin campaign of 1862, and in 1870-71 in campaigns against the Arabs of Yemen, in which he gained the titles of pasha and marshal. He was made commander of the Second Army Corps (1873), and in 1875, at the breaking out of the troubles in Bosnia and Herzegovina, assumed command of the Turkish forces there. After his defeat at the Duja Pass in the Montenegrin campaign of 1876, Mukhtar was sent to Erzerum, to take charge of the operations against Russia on the outbreak of war with that country in 1877. On April 29th he was defeated and driven into Kars; but, in a number of severely contested

battles during the following months, his troops displayed great courage, and regained the position, defeating the Russians severely near Erzerum on June 25th, and compelling them in July to raise the siege of Kars. On October 14-15th at Aladja Dag, the Russians gained an important victory over Mukhtar, driving him back to Kars, and soon afterwards to Erzerum. In November Kars was stormed by the Russians, and before the end of the year Mukhtar was recalled. He put down the Cretan insurrection in 1878 and was put in command on the Greek frontier in 1879. In 1885 he was appointed Turkish High Commissioner in Egypt.

MULA, mōō'la. A town of Southeastern Spain, in the Province of Murcia, situated on a branch of the Segura, 18 miles west of the city of Murcia (Map: Spain, E 3). The place is unimportant, but has some reputation on account of the warm sulphurous baths known as Baños de Mula, some three miles east. Population, in 1900, 12,733.

MULAT'TO. See MIXED RACES.

MULBERRY (OHG. *mōrberi*, *mārberi*, Ger. *Maulbeere*, mulberry, from Lat. *morum*, Gk. *μῆρον*, *mōron*, *μῆρον*, *moron*, mulberry + *berry*, AS. *beri*, *berige*, OHG. *beri*, Ger. *Beere*, Goth. *basi*, *berry*), *Morus*. A genus of trees of the natural order Urticaceæ, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a four-parted perianth, containing either four stamens or one pistil with two styles, the perianth of the female flowers becoming succulent and closing over the small pericarp to form with other flowers of the spike an aggregate fruit. There have been about 100 species described, but much confusion exists among them, and some authors have reduced them to ten or even less. The common mulberry, or black mulberry (*Morus nigra*), a long-lived native of the middle parts of Asia introduced into cultivation in Europe more than a thousand years ago, and now almost naturalized there, is a low, much branched tree, with thick, rough bark and broad, unequally serrated and very rough heart-shaped leaves. It is not hardy in the United States as far north as New York, and is seldom seen except in the South and in California, where some of the improved varieties are grown. The fruit, which is purplish-black, with dark-red juice, fine aromatic flavor, and subacid sweet taste, is often procured in prodigious quantities and is much esteemed for dessert, for preserving, and for wine-making. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silkworms. It is propagated by seed, suckers, layers, or cuttings, and succeeds best in a rich light soil. The white mulberry (*Morus alba*) has been planted in Southern Europe since 1540, in India and China, where it is native, from time immemorial for its leaves, which are the best food for silkworms. In North America it has been extensively planted and in places exists in a half wild state as trees a foot or more in diameter. (See KENRICK, WILLIAM.) The fruit is almost white, and much less palatable than that of the former, although there is great difference among the many varieties. The best variety for feeding silkworms, on account of its rapid growth and abundant leaves, is that called the Philippine mulberry. A variety, tatarica,

called the Russian mulberry, is a hardy, rapid grower, well adapted to hedges, windbreaks, small timber, and ornamental plantings, for which purpose it has been extensively planted in the Western United States. *Morus multicaulis*, by some considered a variety of *Morus alba*, once grown extensively in the United States to feed silk-worms, is seldom seen now. In India the white mulberry is treated as a bush, and cut down twice a year, the stripped shoots being thrown away. Its bark has long been used in China and Japan for making paper. It grows readily from cuttings. The root has a considerable reputation as a vermifuge. The red mulberry (*Morus rubra*), a native of North America, abounding from New York to Nebraska and south to the Gulf of Mexico, is the largest tree of the genus, attaining in the South a height of 70 feet and 3 feet in diameter. It endures severe frosts much better than the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red, and almost as pleasant as the black mulberry. The wood is much more valuable, being fine-grained, strong, and adapted even for shipbuilding. Of each of these three species there are numerous named varieties which are cultivated for their fruits, but they have not received the attention in the United States that they deserve. The Indian mulberry (*Morus indica*) has black fruit of a

RED MULBERRY (*Morus rubra*).

delicate flavor, and the leaves are extensively used for feeding silk-worms in China, Cochin-China, and Bengal. *Morus alba*, *Morus celtidifolia*, and *Morus corylifolia*, Peruvian species; *Morus laevigata*, the species most common in the north of India; and *Morus Cashmeriana*, probably a form of *Morus indica*, a native of Cashmere, produce pleasant fruit; *Morus dulcis*, a native of the north of India, is said to be superior in flavor to all others.

The paper mulberry (*Broussonetia papyrifera*), a native of India, Japan, and islands in the Pacific, frequently planted for ornament in America and Europe, differs from the true mulberry in

having the female flowers collected in a globular mass. The fruit is oblong, dark-scarlet color, sweetish, but insipid. The tree is of moderate size, or, in cultivation, a bush 6 to 12 feet high with leaves either simple or lobed. The islanders of the Pacific cultivate this species with great care and make a kind of clothing from the bark. For this purpose small branches about an inch in diameter are macerated in water. The epidermis is then removed by scraping. The young shoots, treated somewhat like rag pulp in Europe, furnish much of the paper used in Japan and the East. When the shoots are cut, new ones spring up very rapidly. Silk-worms eat the leaves. See Plate of MULBERRY AND LIQUIDAM-BAR, accompanying latter title.

MULBERRY FAMILY. See MORACEÆ.

MULCASTER, RICHARD (1530?-1611). An English schoolmaster, whose birthplace may have been the old border tower of Brackenhill Castle on the river Line, or perhaps Carlisle. From Eton he passed to King's College, Cambridge, and thence to Christ Church, Oxford, where he graduated M.A. in 1556. When the Merchant Taylors' School was founded in London (1561), Mulcaster was appointed its first headmaster, a post which he held till 1586. Here he probably had the poet Spenser as a pupil. Ten years later he was elected high-master of Saint Paul's School. This office he retained to the great age of seventy-eight. He died April 15, 1611. In his own time Mulcaster gained wide repute as an efficient teacher, and in recent times much attention has been given to two books: *Positions, wherein those primitive circumstances be examined, which are necessarie for the training up of children, either for skill in their book or health in their bodie* (1581); and the *Elementarie, which entreateth chiefe of the right writing of our English tung* (1582). Mulcaster strenuously advocated physical training as a part of the education of boys, and implied that there should be grammar schools for girls. He taught his boys music and singing, and permitted them to perform in masques and interludes before the Queen. Consult the reprint of the *Positions*, edited by Quick (London, 1888).

MULCH (more correctly *mulsh*, probably from AS. *molde*, earth mold; ultimately connected with Goth. *malan*, Ir. *melim*, Lith. *maliti*, Lat. *molere*, to grind, Eng. *meal*). A covering of loose material such as brush, leaves, manure, straw, or earth, maintained on the surface of the soil mainly for the purpose of preventing evaporation, which it accomplishes by breaking the continuity of the capillarity in the soil and thus retarding the rise of water to the surface. Stirring the surface soil, and thus maintaining what is termed a 'soil mulch,' brings about the same result. The use of the mulch of vegetable matter is probably not so common as formerly, but the soil mulch is increasing in favor, and in arid regions where agriculture is dependent upon irrigation and conservation of moisture is a matter of great importance. In addition to checking evaporation, mulches of vegetable matter are useful in protecting the surface soil from puddling and washing, keeping the soil cool, preventing freezing, and retarding growth in the spring. Mulching is a valuable means of reclaiming washed or 'galled' lands, and for securing a growth on dry, bare

spots in lawns and meadows. A mulch of barnyard manure not only conserves moisture, but furnishes acceptable plant food.

Mulching berry bushes, orchard trees, etc., on a large scale with coarse manure and refuse material is not to be recommended, because it interferes with cultivation, harbors insects, and causes the plant roots to remain near the surface, thus increasing the danger of injury by drought. Such mulches, except on a small scale and for special purposes, such as protecting small fruits from injury by late frosts by retarding growth in spring, should be replaced by thorough stirring of the soil to maintain a soil mulch. The depth and character of this soil mulch must be determined by a variety of conditions, among which are the kind and root habits of the plant and the character of the soil and climate. It is evident that any crop, such as corn, with an extensive surface root system, would be injured by the destruction of its roots if stirring were frequent and deep. Again, in arid regions the mulch must be deeper and more perfect than in regions of frequent rainfall, in order to be effective and useful.

MULDER, mool'dër, GERARDUS JOHANNES (1802-80). A Dutch chemist, born at Utrecht. After obtaining the degree of doctor of medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, but was soon invited to teach botany and subsequently chemistry at the medical school at Rotterdam. In 1840 he was elected professor of chemistry at the University of Utrecht, and kept this post until 1868, when he retired from active service. Mulder is best known for his researches on the proteids. Concerning the chemical nature of these substances, he advanced a theory according to which the proteids contain in common a characteristic ingredient which he named *protein*. The theory led him into a controversy with Liebig and was not accepted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, etc. His *Chemistry of Vegetable and Animal Physiology* has been translated into English by Fromberg, and his *Chemistry of Wine* by Bence Jones. He also wrote an autobiography under the title *Levenschets* (published posthumously in 1881; 2d ed. 1883).

MULDER, LODEWIJK (1822—). A Dutch writer, born in The Hague. He was an instructor in the Royal Military Academy at Breda in 1851-59; was then for a time employed in the Ministry of War as an editor of original documents in early Dutch history; and from 1868 to 1872 was an inspector of schools in Utrecht Province. He prepared manuals of the history of the Netherlands (1859, 12th ed. 1881), and of general history (1862, 8th ed. 1880), and wrote several plays and works of fiction, the last including his best-known work, *Jan Faessen* (2 vols., 1856), a tale of the conspiracy against Prince Maurice of Orange.

MULE (OF., Fr. *mule*, from Lat. *mulus*, mule). A hybrid animal, the offspring of the male ass and the mare, highly valued as a beast of burden. The ears are long; the head, crop, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the mule approaches more nearly to the horse. The

mule seems to excel both the ass and the horse in intelligence; its powers of muscular endurance are remarkable; and its sure-footedness particularly adapts it to mountainous countries. It is easily kept, endures hunger and thirst better than the horse, lives to a great age, and is comparatively free from disease. Great care is bestowed on the breeding of mules in Kentucky, Missouri, and some other Central States, in Mexico, and in Spain and Italy, and mules of particular districts are highly esteemed. In America, mules are of greatest importance in the Southern States. Texas, Missouri, Tennessee, Mississippi, and Georgia each have over 200,000. The cotton and sugar-cane plantations utilize large numbers because they are easily and cheaply kept. As in other hybrid animals generally, males are more numerous among mules than females in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but instances occur, although rarely, of the female mule producing offspring with the horse and with the ass. The mule is very superior in size, strength, and beauty to the hinny, the offspring of the male horse and the female ass. Several breeds of jacks have been used for producing mules. The chief breeds are Andalusian, Maltese, Catalanian, Italian, and Majorcan. The Catalanian is the best of imported breeds, but in the United States the native jack, a mixture of all breeds, is most used. Black is the preferred color, and the jack should be of good size. The mare should also be well-bred and of good form and color. In the Southern States mules are divided into two classes, the smaller ones 'cotton mules,' and the larger 'sugar mules.'

MULE (in Spinning). See SPINNING.

MULE DEER (so called on account of the large ears), or BLACKTAIL. One of the principal species of North American deer (*Cervus macrotis*, or *Odocoileus hemionus*), originally ranging throughout the open regions of the western half of the United States, but by the end of the nineteenth century restricted to the upper valleys of the Missouri and Saskatchewan rivers, and to the Rocky Mountain region, and the country west and south of it from Northern Mexico to Southern British Columbia. The Southwestern specimens are considered a distinct variety. This deer appears never to have ranged east of the plains, and was always most numerous in the broken country of the West and Northwest. Its favorite haunts are the brushy high-lying valleys. Its favorite place in summer is the summits of the 'mesas,' and the pastures on the chaparral-covered hills or near the timber-line, where it goes to rest along the edge of precipices that give a wide outlook. In winter it comes lower down, and gathers into large herds in the foot-hills, after the manner of the wapiti (q.v.).

It is somewhat larger than the Eastern or Virginian deer (see DEER), and stands about 3 feet 4 inches high at the shoulder. Its body is rather heavy, and its coat is dull yellowish in summer, rather than reddish, and in winter bluish-gray. The ears are very large (suggesting the name), and heavily furred; and its antlers have a short basal snag, above which the beam projects outward and then upward, forking equally and the prongs again dividing, so that there are

normally 10 points. The stern bears a yellowish-white disk, and the tail is of moderate length, round, and black at the end. The hide of this species made the best buckskin known to the Indians, and was most used by them for clothing. Its value was soon learned by the pioneers in the West; and from about 1860 to 1870 this deer was pursued so ruthlessly by hide-hunters that about 250,000 skins were sent annually to England alone, for several years. The venison also is of superior quality, and the haunts and habits of the animal, his craft and speed, make him the most interesting to the sportsmen of all the American deer. The fawns are often domesticated, and the adults thrive well in parks, and are to be seen in every zoölogical garden in the world. Consult: Caton, *Antelope and Deer of America* (New York, 1877); Mayer (ed.), *Sport with Gun and Rod* (New York, 1892); Ledekker, *Deer of All Lands* (London, 1898); Van Dyke, in Roosevelt's *The Deer Family* (New York, 1902); and the writings of travelers and sportsmen in the Western United States. See Plate of DEER OF NORTH AMERICA.

MULE-KILLER. A local name in the Southern States for several species of insects and land arthropods, such as the mantis, pirate bug, and whip-tailed scorpion (qq.v.).

MULEY-HASSAN, mool'a hās'sān, SIDI (1831-94). Sultan of Morocco. He succeeded his father, Sidi Muley-Mohammed, in 1873. He was energetic and warlike, and spent the greater part of his reign in the field, enforcing his authority over the unruly Berber tribes, or extending the boundaries of the Empire in the direction of the Sahara. In 1880 reports of shocking cruelties committed on the Jews in his dominion led to the calling of an international conference at Madrid, which drew up a protocol decreeing liberty of conscience in Morocco, a decision to which the Sultan acceded, but which he altogether ignored.

MULFORD, ELISHA (1833-85). An American Protestant Episcopal clergyman and philosophical writer, born in Montrose, Pa. He graduated at Yale in 1855, and studied for the ministry in the Union Theological Seminary, at Andover, and later at Halle and Heidelberg in Germany. A part of his career was spent in ministerial work in various charges, but from 1864 to 1877 he lived in his native town without parochial charge and engaged in study. Among his publications are: *The Nation, the Foundations of Civil Order and Political Life in the United States* (1870); and *The Republic of God: An Institute of Theology* (1881). In 1881 he settled in Cambridge, Mass., and lectured in the Episcopal Theological School there until his death.

MULGRAVE, CONSTANTINE JOHN PHIPPS, second Baron (1744-92). A British Arctic explorer. Entering the navy at an early age, he served in the reduction of Martinique and of Havana, and in 1765 was made post-captain. In 1768 he entered the Commons for Lincoln, and became known as one of the 'King's friends' and an opposer of the popular cause. Five years later he was commanding the *Racehorse*, which with the *Carcass* attempted the discovery of a northern route to India, but was blocked by ice at Spitzbergen. On his return he again entered

active service and in the naval operations against the French off Ushant (1778) rendered conspicuous service. He published an account of his Arctic voyage in *A Voyage Toward the North Pole* (1774).

MULHALL, MICHAEL GEORGE (1836-1900). A distinguished statistician, born in Dublin, Ireland, September 29, 1836. He was reared at the Irish College in Rome. In 1858 he emigrated to Buenos Ayres, where he established, three years later, the *Standard*, said to be the first daily newspaper printed in English in South America. This daring and successful enterprise Mulhall kept going till 1894. Returning to England in 1878, he gave his attention to statistics. In 1884 he was elected to the British Association for the Advancement of Science. Besides numerous contributions to the *Contemporary Review*, his works include: a *Handbook of the River Plata* (1869), the first English book published in Argentina; *Rio Grande do Sul and Its German Colonies* (1873); *The English in South America* (1878). In 1880 Mulhall, who had for some time been gathering materials on his favorite subjects of statistics, brought out his *Progress of the World in Arts, Agriculture, Commerce, Manufacture, Instruction, Railways, and Public Wealth*, since the beginning of the nineteenth century. This was followed by other highly valued works on statistics: *History of Prices* (1885); *Industries and Wealth of Nations* (1896); and a *Dictionary of Statistics* (1892; 4th ed. 1899). Mulhall died December 13, 1900, in Dublin.—His wife, Mrs. MARION MULHALL, is the author of *Between the Amazon and the Andes* (1883), and several essays, including the *Celtic Sources of Dante's Divine Comedy*. For this last monograph she was honored by a chair in the Arcadia of Rome.

MÜLHAUSEN, mul'hou-zen. The second largest city of Alsace-Lorraine, Germany, situated on the Ill and the Rhine-Rhone Canal, 67 miles by rail south-southwest of Strassburg (Map: Germany, B 5). It is divided into the old town, built on an island of the Ill, the new town, between the old town and the canal, and the workingmen's colony (*cité ouvrière*) in the northwest. The old town is irregularly built, and with the exception of the Rathaus, dating from the sixteenth century, and a few modern churches, has few noteworthy buildings. The new town was laid out in the middle of the nineteenth century and has a fine post-office, and a museum established by the Industrial Society. The society is housed in a fine building with natural history collections and a library. The workingmen's colony, established in 1853 by Mayor Dollfus, is provided with model dwellings and with reading rooms, schools, restaurants, baths, and other institutions belonging to a modern town. The educational institutions of Mülhausen include a gymnasium and a number of technical schools. It is the most important industrial city of Alsace-Lorraine and one of the largest textile centres of the Empire. This industry of Mülhausen dates from the middle of the eighteenth century, and the cotton mills are situated partly in the city and partly in the vicinity and especially in the adjacent settlement of Dornach. Over 80,000 persons are said to be engaged in the textile mills and in other

establishments connected with the textile industry of the manufacturing district around Mülhausen. Besides cotton and woolen goods and kindred products, there are also manufactured machinery and chemicals, and the trade is extensive in local manufactures and the agricultural products of the vicinity. Population, in 1890, 76,892; in 1900, 88,012, largely Roman Catholics. Mülhausen, after belonging for a short time to the bishops of Strassburg, became a free city of the Empire in 1273. In order to maintain its independence, it entered into an alliance with the Swiss cantons of Bern and Solothurn in 1466, and in 1515 became a member of the Swiss Confederation, and was recognized as such at the Peace of Westphalia. It joined the French Republic in 1798, and passed to Germany with Alsace-Lorraine in 1871. Consult: Metzger, *La république de Mulhouse* (Lyons, 1883); Schneider, *Geschichte der Stadt Mülhausen* (Mülhausen, 1888); Heydenreich, *Aus der Geschichte der Reichsstadt Mülhausen* (Halle, 1900); Jordan, *Der Uebergang der freien Reichsstadt Mülhausen an Preussen* (Mülhausen, 1902).

MÜLHEIM-ON-THE-RHINE, mül'him, or **MÜHLHEIM**. The capital of a circle in the Rhine Province, Prussia, on the Rhine, here crossed by a bridge, nearly opposite Cologne (Map: Prussia, B 3). It has a handsome modern Gothic church, a realgymnasium, a textile school, and a commercial school. Manufactured products are wire ropes and cables, velvet, silk, machinery, wagons, chemicals. The town has a safe harbor, and trades in wine. Population, in 1890, 30,996; in 1900, 45,085. Mülheim is of ancient origin, and became a town in 1322.

MÜLHEIM-ON-THE-RUHR, or **MÜHLHEIM**. The capital of a circle in the Rhine Province, Prussia, on the Ruhr, 16 miles north of Düsseldorf (Map: Prussia, B 3). It has a church from the twelfth century, a gymnasium, and a realschule. Coal and iron are mined in the district, and there are extensive iron works, manufactures of machinery, woolen and cotton goods, leather, and glass. Population, in 1890, 27,903; in 1900, 38,292.

MULIER, PIETER, the younger, called Tempesta (1637 or 1643-1701). A Dutch landscape and marine painter, born at Haarlem, son and probably pupil of Pieter Mulier, the elder (died at Haarlem, 1670)—not, as was for a long time erroneously supposed, son of Pieter de Molyn (q.v.). After having traveled through Flanders and Holland to study the best Flemish and Dutch masters, he went to Rome and soon acquired great reputation by his remarkable pictures of storms at sea, whence his surname, given him by the Italians. In Genoa, whither he went from Rome, he was imprisoned under suspicion of having caused his wife to be murdered, and after a confinement of sixteen years made his escape to Piacenza during the bombardment of Genoa in 1684, and passed the remainder of his days in Milan. Five of his most characteristic works (three thunder storms and two landscapes with figures) may be seen in the Dresden Gallery; others in Hamburg, Brunswick, Cassel, Karlsruhe, Vienna (Museum, Academy, Liechtenstein Gallery), Saint Petersburg, in the Brera Gallery, Milan, and several other Italian collec-

tions. A portrait of himself is in the Uffizi at Florence.

MULITA, mō-lē'tā (Sp., little she-mule). A small armadillo (*Tatusia hybrida*), allied to the peba, but confined to Southern South America; so called from the resemblance of its face and ears to those of a mule.

MULL. The second largest island of the Inner Hebrides, belonging to Argyllshire, Scotland. It is situated north of the Firth of Lorne, and is separated from the west coast of Scotland by the Sound of Mull, from one to three miles wide (Map: Scotland, C 3). It has an area of 347 square miles, is very irregular in shape, deeply indented with bays and sea-locks, and consists mainly of volcanic rock with some outcroppings of granite. The island as a whole is mountainous, rising in Ben More to a height of 3185 feet. The scenery along the coast is very picturesque, and there are beautiful lakes and woods in the interior; but the scenery in the interior is not striking, the mountains being rounded in outline, and large tracts consisting of moorlands. The soil is fertile, but the stormy and humid climate is unfavorable for agriculture, and the land is chiefly used for grazing—cattle, sheep, and horses being exported. The population in 1891 was 4691; in 1900, 4711. The chief town is Tobermory, on the north coast, with a population (1901) of 1019.

MULLANY, JAMES ROBERT MADISON (1818-87). An American naval officer, born in New York City. He entered the navy as a midshipman in 1832, and in 1844 was promoted to the rank of lieutenant. During the war with Mexico he participated in the capture of Tabasco. He was commissioned commander in 1861 and captain in 1866, and during the Civil War was assigned to duty with the blockading squadron. At his own request he was transferred from the *Bienville* to the *Oneida*, that he might take part in the battle of Mobile Bay, August 5, 1864. His ship, one of the last in the line, received a terrific pounding from Fort Morgan, and was attacked by the Confederate ram *Tennessee*, which would probably have sunk it had not the monitor *Winnebago* come to the rescue. As it was, the *Oneida* was disabled by the fire from the fort, many of her crew were killed, and Commander Mullany lost his left arm. After the war and while commanding the North Atlantic squadron (1874-76) he gave material aid to Generals William H. Emory and Philip H. Sheridan at New Orleans, and during a revolution in Columbia protected American interests on the Isthmus of Panama. He became a commodore in 1870, a rear-admiral in 1874, and retired in 1879.

MULLEIN (AS. *molegn*, mullein). A name given to members of the genus *Verbascum*, of the natural order Scrophulariaceæ, of which there are more than 100 species, mostly large biennial or perennial herbs with rather thick tap-roots, and natives of the Eastern Hemisphere. The more or less woolly plants produce flowers upon spikes or panicles. The leaves and flowers were formerly reputed to have medicinal qualities, but are not so recognized in the United States. They contain a sort of mucilage which is obtained by boiling the leaves in water. Three European species are well-known weeds in the United States, the common mullein (*Verbascum Thapsus*), the moth

mullein (*Verbascum blattaria*), and the white mullein (*Verbascum lychnitis*). In Kentucky, *Verbascum phlomoides* is reported as established and spreading as a weed.

COMMON MULLEIN (*Verbascum Thapsus*).

MÜLLENHOFF, mu'l'en-hôf, KARL VIKTOR (1818-84). A German student of Teutonic antiquities and philology. He was born at Marne, Holstein, and after studying at Kiel, Leipzig, and Berlin, was professor at Kiel (1846-58) and at Berlin (1858-84). Müllenhoff's greatest works were: *Deutsche Altertumskunde* (1870-99), which he left unfinished, and the treatise *De Antiquissima Germanorum Poesi Chorica* (1847). Consult Scherer and Schröder, *Karl Müllenhoff* (Berlin, 1896).

MÜLLER, mu'lër. A family of celebrated quartet players. They were the sons as well as pupils of the principal musician to the Duke of Brunswick, and were all of them born in the city of Brunswick. CARL FRIEDRICH (1797-1873) was first violin in the quartet and was also concertmeister to the Duke. THEODOR HEINRICH (1799-1855) was the viola player. AUGUST THEODOR (1802-75) played the cello, and FRANZ FERDINAND GEORG (1808-55) was the second violin. They were especially educated by their father for quartet work, and were conceded to have reduced the art of string quartet playing to a degree of perfection previously unknown. They were ambitious for greater fame than could be obtained within their own limited environment, and were particularly handicapped by the Duke of Brunswick, in whose employ they were, who had formulated the order that none of his

musicians should participate in any musical performance outside that connected with his own corps. In 1830 they resigned their employment, and made their first appearance in Hamburg, where they met with such success that they were invited to Berlin, in which city they were received with great enthusiasm. An extended tour throughout Germany followed, and in 1837 they performed in Paris. Other successful tours made them known throughout the world. They confined their programmes almost entirely to the works of Haydn, Mozart, and Beethoven, and were also a very important influence in raising and establishing a higher standard of musical appreciation.

MÜLLER, ANDREAS (1811-90). A German historical painter, born at Cassel. He was the son and pupil of Franz Hubert Müller (director of the Darmstadt Gallery), and afterwards studied in Munich under Schnorr and Cornelius, and in Düsseldorf under Sohn and Schadow. On his return from Italy, where he stayed in 1837-42, he executed some famous frescoes at Remagen and Sigmaringen. In these works he was assisted by his son FRANZ (1843—). From 1856 till 1882 Andreas was professor at the Düsseldorf Academy. He was noted for his skill in restoring old or damaged pictures.

MÜLLER, AUGUST (1848-92). A German Orientalist, born at Stettin, and educated at the universities of Halle and Leipzig. In 1882 he accepted the post of professor of Oriental philology at the University of Königsberg. His numerous and valuable contributions to Oriental literature include: *Die griechischen Philosophen in der arabischen Uebersetzung* (1873); *Der Islam im Morgen- und Abendland* (1885-87); *Hebräische Schulgrammatik* (1878), the syntax of which was translated into English by James Robertson. He also reëdited (1876) Caspari's *Arabische Grammatik*, which he considerably enlarged, and with Nöldeke published a *Delectus Veterum Carminum Arabicorum* (1890), furnished with copious annotations, and thus rendered useful to those who desire to become acquainted with Arabic poetry. Especially creditable is his edition (1884) of the *History of Physicians* by Ibn Useibia, with Arabic text and a critical commentary. Several of his essays are contained in the *Zeitschrift der deutschen morgenländischen Gesellschaft* and *Beiträge zur Kunde der indogermanischen Sprachen*. In 1887 he was appointed editor of the *Orientalische Bibliographie*.

MÜLLER, mu'lär', CHARLES LOUIS (1815-92). A French historical painter. He was born in Paris, December 22, 1815, and was a pupil of Baron Gros and Léon Cogniet. He received a first-class medal at the Paris Exposition of 1846. Müller is best known by his masterpiece, the "Roll-Call of the Last Victims of the Reign of Terror," formerly in the Luxembourg Museum (replica in possession of J. J. Astor, New York). Other works are: "Lady Macbeth" (1849), Amiens Museum; "Charlotte Corday in Prison" (1875), Corcoran Gallery, Washington; "Primavera" (1846) and "Haydée" (1848), Lille Museum; he also decorated the Salle d'Etat in the Louvre. His pictures are skillfully composed, but the coloring and drawing are mediocre.

MÜLLER, mu'lër, DAVID HEINRICH (1846—). An Austrian Orientalist, born at Buczacz, in

Galicia. He was educated in Vienna, Leipzig, Strassburg, and Berlin; became professor of Semitic philology at Vienna in 1881, and was an editor of the *Wiener Zeitschrift für die Kunde des Morgenlandes*. His very valuable works include: *Himjaritische Inschriften* (1875); *Südarabische Studien* (1877); *Die Burgen und Schlösser Südarabiens* (1879-81); *Sabäische Denkmäler* (with Mordtmann, 1883); *Epigraphische Denkmäler aus Arabien* (1889); *Die altsemitischen Inschriften von Sendschirli* (1893); *Epigraphische Denkmäler aus Abessinien* (1894); *Ezechielstudien* (1895); *Die Propheten in ihrer ursprünglichen Form* (1896); *Südarabische Alterthümer* (1899); *Die Mahri- und Sokatri-Sprache* (1901); and editions of *Kitab al Farq* (1876); of Hamdani, *Geography of the Arabian Peninsula* (1884-91); and of part of Tabari, *Annales* (1888).

MÜLLER, EDUARD (1828-95). A German sculptor, born at Hildburghausen. His first occupation was that of a cook in the ducal kitchen at Coburg, and he practiced his trade subsequently in Munich and Paris, and thence went to Antwerp, where, on the advice of the sculptor Geefs, he proceeded to study at the Academy in 1850. Two years afterwards he continued his studies in Brussels, and in 1857 settled permanently in Rome. Masterly composition, great truthfulness to life, and a high degree of technical perfection are the chief characteristics of his ideal figures and mythological groups, the best known of which include: "Nymph Kissing Cupid" (1862); "Faith, Love, and Hope" (1869), Schröder Mausoleum, Hamburg; "Satyr with the Mask" (1870); "The Faun's Secret" (1874); and "Eve with Her Children" (1880). His masterpiece is the group in heroic size, "Prometheus Bound and the Oceanids" (1874-79), National Gallery, Berlin, chiseled out of a single block of marble.

MÜLLER, FERDINAND VON (1825-96). A German naturalist. He was born in Rostock, studied at Kiel, and in 1848 went to Australia, where he was for several years engaged in botanic explorations, and was director of the Melbourne Public Garden (1857-73). His researches on the subject of the acclimatization of plants yielded highly valuable results. Müller wrote: *Fragmenta Phytographiæ Australiæ* (1862-81); *Plants of Victoria* (1860-65); *Flora Australiana* (7 vols., 1863-70); and *Select Extratropical Plants* (1891).

MÜLLER, FRIEDRICH (called Maler Müller) (1749-1825). A German poet, painter, and engraver, born at Kreuznach. He showed in his youth a talent for art, and began to study painting at Zweibrücken, where his fascinating personality and varied endowments won him the favor of the Court circles. In 1774 he went to Mannheim, and soon acquired a reputation as a poet. His idyls were inspired, first by Gessner, afterwards by Voss, some of them being realistic descriptions of the life of the common people in the Palatinate. He is best known as a dramatist, and as such a true representative of the 'Storm and Stress' period, whose unbalanced enthusiasm is most apparent in *Golo und Genovera*. To the theme attempted in *Fausts Leben dramatisirt* his powers were hardly adequate. In 1777 he had become electoral Court painter, and in 1778 means were provided to satisfy the artist's longing for Rome. Although he continued there his literary efforts for a time, he more especially

cultivated painting, setting up Michelangelo as his idol, but falling into exaggerations and never attaining any real success. Gradually estranged from his art through failures and distress, he devoted himself to art-historical studies, became a sort of ambulant antiquary, and was much sought as a cicerone. Through the patronage of the Crown Prince of Bavaria (afterwards King Louis I.) he was enabled to pass his declining years in comparative ease. Consult Seuffert, *Der Maler Müller* (Berlin, 1877).

MÜLLER, FRIEDRICH (1782-1816). A German engraver, born at Stuttgart. He first studied under his father, Johann Gotthard Müller, an engraver of note, and subsequently in Paris. In 1808 his engraving of "Saint John About to Write His Revelation," after Domenichino, won him a high reputation, which was maintained by his "Adam and Eve Under the Tree of Life," after Raphael. In 1814 he was appointed professor of engraving in the Dresden Academy, and the rest of his life was devoted to the execution of the plate of his greatest work, the "Madonna di San Sisto," after Raphael. His health broke down under the labor imposed by this undertaking, and he did not live to see a finished print of his work. His engravings are only eighteen in number, mostly portraits, including Schiller, Jerome Bonaparte, Jacobi, and a medallion of Napoleon I.

MÜLLER, FRIEDRICH (1834-98). An Austrian philologist. He was born at Jemnik, Bohemia; studied in Vienna and Göttingen, and from 1866 until his death was professor of comparative philology and Sanskrit at the University of Vienna. He was a member of the Academy of Sciences, and was one of the highest authorities on comparative philology and ethnology and the relations of the two sciences. Besides contributing largely on these subjects to the *Mittheilungen der anthropologischen Gesellschaft* and the *Wiener Zeitschrift für die Kunde des Morgenlandes*, and editing these periodicals for a time, he wrote the linguistic and the ethnological parts of the *Reise der österreichischen Fregatte Novara* (1867-73); *Allgemeine Ethnographie* (1873); and a *Grundriss der Sprachwissenschaft* (1876-87).

MÜLLER, FRIEDRICH VON (1779-1849). A German statesman. He was born at Kunreuth, Bavaria; studied law at Erlangen and Göttingen, and in 1801 entered the administrative employ of Weimar. His greatest political achievement was his inducing Napoleon to keep Weimar independent (1806-07). For this he was rewarded by being ennobled and raised to the post of Privy Councillor. He wrote *Erinnerungen aus den Kriegezeiten von 1806-13* (1851). Müller became Chancellor in 1815, and from 1835 to 1848 was Deputy. On his friendship with Goethe, consult Burkhardt, *Goethes Unterhaltungen mit dem Kanzler Friedrich von Müller* (Stuttgart, 1870).

MÜLLER, FRIEDRICH MAX (commonly called Max) (1823-1900). One of the best known of recent Orientalists and philologists. He was born at Dessau, in the Duchy of Anhalt-Dessau, December 6, 1823, where his father, the poet Wilhelm Müller (q.v.), was librarian of the ducal library. Max Müller received the elements of his education at Dessau, and then went to Leipzig, where, under Hermann Brockhaus, he began the study of Sanskrit. This he soon chose as his

special pursuit, and at the age of twenty he was ready for the degree of doctor of philosophy. The first fruits of his labors appeared in a translation of the *Hitōpadēśa* (1844). In 1844 he went to Berlin to study under Bopp and Schelling, and to consult the Sanskrit manuscripts there. In Paris, whither he went in 1845, he began, at the suggestion of Burnouf, to prepare an edition of the *Rig-Veda*, with the commentary of Śāyana (q.v.). With this view he went to England, June, 1846, to examine the manuscripts in the East India House, London, and the Bodleian Library at Oxford, and, on the recommendation of the distinguished Sanskritist H. H. Wilson, the East India Company commissioned him (1847) to edit the *Rig-Veda* at their expense. The first volume of this great undertaking appeared in 1849, and the sixth and concluding volume was published in 1874. A second edition was issued in 1889-92. In 1850 Max Müller was appointed deputy Taylorian professor of modern languages at Oxford; in 1854 he succeeded to the professorship, and in 1858 he was elected a fellow of All Souls' College. While pursuing his labors connected with the *Rig-Veda* he published treatises on a variety of philological topics which did more to awaken in England a taste for the science of language in its modern sense than the labors of any other single scholar. Inheriting the poetic imagination and fire of his father, he had at command such a felicity of illustration that subjects dry under ordinary treatment became in his hands attractive. The lectures which he delivered on the Hibbert Foundation on the *Origin and Growth of Religion* (1878), and the Gifford series on *Natural Religion, Physical Religion, Anthropological Religion, and Theosophy or Psychological Religion* (1890-92), attracted much attention. He continued to publish on literary, linguistic, and philosophical subjects up to the time of his death, which occurred at Oxford, October 28, 1900. Among his long list of works, mention may be made of a translation into German of Kalidasa's *Meghadūta* (1847); *The Language of the Seat of War in the East* (2d ed. 1855); *Comparative Mythology* (in the "Oxford Essays" for 1856); *History of Ancient Sanskrit Literature* (2d ed. 1860); lectures on *The Science of Language* (1861; last ed. 1889); *The Science of Religion* (1870). *Chips from a German Workshop*, in four volumes, was published 1868-75; the Hibbert Lectures on the *Origin and Growth of Religion*, in 1878; *Selected Essays*, in 1881; *Six Systems of Indian Philosophy* (1899); *Auld Lang Syne* (1st and 2d series, 1899); and *Ramakrishna, His Life and Sayings* (1899). His translation of Kant's *Critique of Pure Reason*, with a scholarly introduction, appeared in two volumes (1881). He wrote a romance, *Deutsche Liebe* (12th ed. 1901). He was editor of the important series *The Sacred Books of the East*: was one of the eight foreign members of the Institute of France, a Knight of the Prussian Order, a member of the Privy Council of the Queen of England, besides being the recipient of many honorary degrees. After his death appeared his *Last Essays* (1901) and *My Autobiography* (1901), edited by his son. Consult *Life and Letters of the Right Honorable Friedrich Max Müller*, edited by his wife (London, 1903).

MÜLLER, GEORG ELIAS (1850—). A German professor of philosophy, born at Grimma, in

Saxony. He was educated at the universities of Leipzig, Berlin, and Göttingen. In 1870 he entered the German army as a volunteer, and took part in the campaign against France. On returning to academic life he became privat-docent at Göttingen (1876), and professor of philosophy at Czernowitz (1880). In April, 1881, he was appointed full professor at Göttingen. He published: *Zur Theorie der sinnlichen Aufmerksamkeit* (1873); *Zur Grundlegung der Psychophysik* (1878); *Zur Theorie der Muskelcontraction* (1891); *Zur Analyse der Unterschiedsempfindlichkeit*, with L. G. Martin (1899); and *Experimentelle Beiträge zur Lehre vom Gedächtnis*, with Pilzecker (1900).

MÜLLER, GEORG FRIEDRICH (1805-98). A German evangelist and philanthropist. He was born at Kroppenstädt, Prussia, near Magdeburg, September 27, 1805. He entered the University of Halle (1825) as a divinity student, although his life was anything but exemplary. Late in that year he was converted, and in 1826 began preaching. In June, 1828, he was invited to London by the Society for Promoting Christianity among the Jews, to engage in its service for six months, and in March, 1829, reached London. He settled as pastor of Ebenezer Chapel, Teignmouth, in connection with the Plymouth Brethren; in 1832 he removed to Bristol, and was co-worker with Henry Craik. While at Teignmouth he gave up pew-rents and depended on voluntary gifts, for which a box was placed in the chapel. The result was a largely increased income, and from that time on he would take no salary, depending wholly upon voluntary gifts. In December, 1835, after a visit to the Continent, he published a proposal for the establishment of an orphan-house for destitute children bereft of both parents. Spontaneous offers of money and service were received, and the opening of the home was announced May 18, 1836. At the end of 1856 there were 297 orphans under his care. The number of orphans increased and the buildings were multiplied, until in 1875 "2000 children were lodged, fed, and educated, without a shilling of endowment, without a committee, without organization, by funds drawn from all parts of the world." In 1849 he moved the orphanage to Ashley Down, a suburb of Bristol, to specially constructed buildings. Attended by his wife, he made evangelistic tours all over the world. His *Narrative* and other books and pamphlets had a large sale, and gave information of his work. He died at Ashley Down, March 10, 1898. Consult his biography, by A. T. Pierson (New York, 1899).

MÜLLER, GERHARD FRIEDRICH (1705-83). A German historian, born at Herford, in Westphalia, and educated at Leipzig. Entering the newly established Saint Petersburg Academy, he gave instructions in history, geography, and Latin, and was soon appointed professor of history. In 1740 he went to Siberia and traveled for ten years, engaged in the study of its antiquities and geography. Of his great work on Siberia only one volume was published (1750). On his return he became historiographer to the Empire, and in 1766, after many attacks by his colleagues, was appointed keeper of the national archives. He drew up for the Government a collection of its treatises, and wrote a number of works on Russian history, in which subject he was a high authority. His most important

book, a *Collection for the History of Russia*, appeared at Saint Petersburg, in nine volumes (1732-65). His work in geography and cartography was also important.

MÜLLER, mü'lër, IVAN VON (1830—). A German classical philologist. He was born at Wunsiedel, in Bavaria; was professor in the University of Erlangen (1864-93), and from 1893 professor in the University of Munich. His published works are numerous; he is best known as general editor of the comprehensive *Handbuch der klassischen Altertumswissenschaft* (Munich, 1885), and also as the editor of many of the works of Galen, and as reviser of Nägelsbach's *Lateinische Stilistik* (Nuremberg, 1888).

MÜLLER, JOHANN FRIEDRICH THEODOR (known as FRITZ MÜLLER, or MÜLLER-DESTERRO) (1821-97). A German naturalist, known for his contributions to bionomics and to the evolution theory. He was born at Windischholzhausen, near Erfurt. He studied at Greifswald and Berlin. The troubles of 1848 finally drove him from home and Berlin, and he emigrated to Southern Brazil, settling at Blumenau, on the island of Santa Catharina. Here he lived the life of a colonist and pioneer until 1856, when he became a teacher of mathematics and natural history in the gymnasium at Desterro. After various changes he was in 1874 appointed *naturalista viajante* of the museum at Rio Janeiro, and lived at Itajahy. Afterwards he was suddenly dismissed from his position, without any explanation from the authorities, and returned to Blumenau.

Müller published numerous papers on jelly-fishes and worms, but more particularly on crustaceans and insects, his articles appearing mostly in Wiegmann's *Archiv für Naturgeschichte*, *Kosmos*, *Natur*, and the *Annals* of the Rio Janeiro Museum. His single book, *Facts for Darwin*, was called out by Darwin's *Origin of Species*, and it gave him wide fame. It was written at Desterro in 1863, was published at Leipzig in 1864, and was translated, with some additions, into English in London in 1869. It was the application of Darwinian principles to certain forms of a single class, the Crustacea. In this book we have, in the chapter on the "Progress of Evolution," the first clear statement of the biogenetic law or recapitulation theory afterwards restated by Haeckel. Müller also proposed the theory of mimicry which bears his name. See MIMICRY.

MÜLLER, JOHANN GOTTHARD VON (1747-1830). A German line engraver, born at Bernhausen, near Stuttgart. He at first studied under the Court painter Guibal, but, developing a talent for engraving, went to Paris in 1770, where for six years he studied under Wille. He won a number of prizes there, and was elected a member of the French Academy. In 1776 Duke Charles recalled him to Stuttgart, where he taught for nine years, and whence he was summoned to Paris to engrave a portrait of Louis XVI., after Duplessis. Next in importance to this is his engraving of Trumbull's "Battle of Bunker Hill." On his return to Stuttgart he became professor of engraving. He was elected a member of the principal European academies, and was knighted in 1818. He engraved thirty-three plates in all, of which, besides those mentioned, the best are: "Madonna della Seggiola," after Raphael; "Saint Catharine with Two An-

gels," after Leonardo da Vinci; "Schiller," after the portrait by Graf; and "Saint Cecilia," after Domenichino.

MÜLLER, JOHANNES (1436-76). The real name of the German scientist Regiomontanus (q.v.).

MÜLLER, JOHANNES (1801-58). The most masterful, accurate, and influential physiologist and morphologist of his time. He was born at Coblenz, Rhenish Prussia, July 14, 1801; began to study theology, but abandoned it for medicine, beginning his medical studies at Bonn in the autumn of 1819. While there he prepared a prize essay, *De Respiratione Fetus* (1821). He graduated in 1822. In the spring of 1823 he went to Berlin and studied with Rudolphi, then returned to Bonn as privat-docent, to teach physiology and comparative anatomy. In 1826* he was appointed professor extraordinarius in the University of Bonn, and he was made full professor in 1830. In 1833 he was called to the University of Berlin, where he succeeded Rudolphi as professor of anatomy and physiology, and after Meckel's death he edited the *Archiv für Anatomie, Physiologie und wissenschaftliche Medicin*, and remained at Berlin until his death, which occurred April 28, 1858.

With his unusual powers of application, thoroughness, and breadth, his acuteness and penetration, young Müller opened up in different directions new fields of research. In 1826 he published an important work on the physiology of sight, and a treatise entitled *Ueber die phantastischen Gesichterscheinerungen*, and in 1827 a work based on his lectures on physiology; in 1829 his work on general pathology, and in 1833 the first part of his epoch-making *Handbook of Human Physiology*, which was completed in 1840. In 1834 he was elected a member of the Berlin Academy of Sciences. As a physiologist he was the founder of a new school, working by novel methods. To him physiology owes the foundation of Bell's law, the principle of reflex movements and other nervous activities; comprehensive and detailed views on vision and hearing; a thoroughly well-grounded knowledge of the nature of the blood, lymph, and chyle; the proof of the independence of the quality of glandular secretions from the grosser structure of the glands, and the knowledge of chondrin. Müller opposed the school of nature-philosophers and placed physiology on a sound basis. He was also a founder and leader in the new morphology. The science of comparative embryology was greatly enriched by his researches. He discovered the pronephric ducts which bear his name, and explained the nature of hermaphroditism; he made extended contributions to and laid the foundations of our knowledge of the embryology and metamorphoses of the echinoderms, and he examined into the mode of development of certain sharks, which led up to his subsequent studies on the ganoids and Amphioxus. The debt morphology owes him is shown in his discovery of the lymph-hearts of the Amphibia, the micro-pyle of the eggs of fishes, holothurians, and the like, the intimate structure of glands, of cartilaginous and bony tissue, of erectile tissue, of the musculature of the intestines, and the finer structure of the peritoneum.

His principal works in comparative anatomy and morphology were his *Vergleichende Ana-*

tomie der *Myainoiden* (1834-43), which Carus has called 'the codex of the morphology of vertebrates.' In collaboration with Henle he published, in 1841, *Systematische Beschreibung der Plagiostomen*, and in systematic zoölogy his principal works were *System der Asteriden* (1842), with the collaboration of Troschel, and *Horæ Ichthyologicae*. Besides these he published upward of two hundred articles, addresses, and reports, most of which appeared in the *Transactions of the Berlin Academy of Sciences* and in the *Archiv für Anatomie, etc.*

Consult the biographical notices by Du Bois-Reymond (*Abhandlungen der Berliner Akademie*, 1859), containing a list of his works; Virchow, *Johannes Müller, Eine Gedächtnisrede* (Berlin, 1858); Bischoff, *Ueber Johannes Müller und sein Verhältnis zum jetzigen Standpunkt der Physiologie* (Munich, 1858); *Proceedings of the Royal Society of London*, vol. ix., p. 556.

MÜLLER, JOHANNES VON (1752-1809). A German historian. He was born January 3, 1752, at Schaffhausen, where his father was a clergyman and rector of the gymnasium. He studied at Göttingen under Heyne, Schlözer, Walch, and others. In 1772 he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, *Bellum Cimbricum*. He now began to devote his leisure hours to the investigation of Swiss chronicles and documents. In 1780 he published the first volume of his great work, *Geschichte der Schweizer*, and in 1781 was called to the *Collegium Carolinum* at Cassel, as professor of statistics. In 1786 he was appointed librarian and Councilor of State to the Elector of Mainz; here he finished the second volume of his Swiss history; his *Darstellung des Fürstenbundes* (1787); and *Briefe zueier Domherren* (1787). In 1792 he went to Vienna, where the Emperor made him a member of the Aulic Council, and where he in 1800 became first Imperial librarian. In 1804 he left Vienna for Berlin, where he wrote, among other things, an additional volume of his Swiss history. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807) Secretary of State in the new Kingdom of Westphalia. He died at Cassel, May 29, 1809. His works have all been replaced by more modern researches, but in their own day they were of great value. Besides those mentioned, the *Vierundzwanzig Bücher allgemeiner Geschichte*, based on lectures delivered in Geneva (1811 and often republished), are important. Müller's *Sämmtliche Werke* were published (27 vols., Stuttgart, 1810-19; new ed., 40 vols., 1831-35).

MÜLLER, JULIUS (1801-78). A German theologian. He was born at Brieg, Silesia, and was a brother of Karl Otfried Müller (q.v.). He studied at Breslau and Göttingen, at first devoting himself to law, but afterwards to theology. In 1825 he was appointed pastor at Schönbrunn and Rosen, near Strehlen, where he remained seven years. He was appointed in 1831 second university preacher in Göttingen, and there lectured on practical theology and pedagogics. In 1834 he became extraordinary professor of theology in Göttingen, and soon after full professor in Marburg, whence he went in 1839 to occupy a similar chair in Halle. The work on which his reputation as a theologian chiefly rests is *Die christliche Lehre*

von der Sünde (1839; 6th ed. 1889; Eng. trans., from the 5th ed., Edinburgh, 1868); also *Dogmatische Abhandlungen* (1870). He afterwards published pamphlets on subjects of temporary interest, particularly in vindication of the cause of evangelical union against the attacks of the rigid Lutherans. In conjunction with Neander and Nitzsch, he edited a periodical entitled *Deutsche Zeitschrift für christliche Wissenschaft und christliches Leben*. Consult his biography, by L. Schultze (Bremen, 1879).

MÜLLER, KARL OTFRIED (1797-1840). A German archaeologist and philologist, born at Brieg, in Silesia. He studied at Breslau and Berlin, where he was the pupil of August Boeckh. His dissertation, *Liber Ægineticorum* (1817), showed the direction of his future studies, which were devoted to the reconstruction of the history of Greek localities and races. In 1817 he was appointed a teacher at the Magdaleneum in Breslau, in 1819 professor extraordinarius of philology, and in 1823 professor ordinarius at Göttingen. In connection with his studies he traveled widely, and in 1839 secured leave of absence for a visit to Greece and Italy. A sunstroke received while he was copying inscriptions at Delphi led to an attack of fever, from which he died at Athens, where he was buried on the Hill of Colonus. His desire to reconstruct the entire ancient life naturally led Müller to a wide range of scholarly activity. His great work was to be his *Geschichte hellenischer Stämme und Städte*, of which he completed vols. i., *Orchomenos und die Myner* (1820), and ii., *Die Dorier* (1824); a second edition of these works by Schneidewin (1844; trans. by G. C. Lewis and H. Tafnell, London, 1839). In the same field belonged his treatise, *Ueber die Wohnsitze, Abstammung und ältere Geschichte des macedonischen Volks* (1825), and his *Etrusker* (1828; 2d ed. by Deecke, 1877). His *Handbuch der Archäologie der Kunst* (1830; 3d ed. by Welcker, 1846; trans. by Leitch, London, 1850), though now antiquated in its collections, is of value from the many acute observations it contains. It was accompanied by Müller and Oesterley, *Denkmäler der alten Kunst* (Göttingen, 1834-39), which was continued and completed by Wieseler (1846-56). A third edition appeared (1877-81); a fourth edition of part ii., *Kunstmythologie*, was begun at Leipzig in 1899. His *Prolegomena zu einer wissenschaftlichen Mythologie* (1825) was based on his belief that the elements of the Greek religion were to be found in analysis of the myths, which would refer the specific names to specific places and tribes. He strongly opposed the theories of large foreign influence in Greek civilization. In the last years of his life he undertook to prepare, for the English Society for the Diffusion of Useful Knowledge, a history of Greek literature. A translation by Lewis and Donaldson from the author's manuscript, entitled *A History of the Literature of Ancient Greece*, was published in London in 1840, and with a continuation by Donaldson in 1858. The German original, *Geschichte der griechischen Litteratur bis auf das Zeitalter Alexanders* (1841; 4th ed., revised and continued by Heitz, 1882-84), was published by his brother after his death, as well as *Kleine deutsche Schriften* (1841). A collected edition of *Kunstarchäologische Werke*, in five volumes, was published in Berlin (1872-73). Müller was also prominent as an editor. His

edition in Greek and German of *Æschylus's Eumenides* (Göttingen, 1833) gave rise to a fierce controversy with Gottfried Hermann and his school, while his critical editions of Varro, *De Lingua Latina* (Leipzig, 1833), and Festus, *De Significatione Verborum* (ib., 1839), were long standards and are still valuable. For his biography, consult F. Ranke (Berlin, 1870).

MÜLLER, LEOPOLD (1834-92). An Austrian genre painter, born in Dresden, of Austrian parents. He was a pupil of Karl Blaas and of Christian Ruben at the Academy in Vienna. Obligated to support his family after his father's death, he worked eight years as an illustrator for the Vienna *Figaro*. Continuing his studies subsequently, he visited repeatedly Italy and Egypt, and made his name favorably known through a series of scenes from popular life in Italy and Hungary. Afterwards he displayed his coloristic talent to greater advantage in Oriental subjects, such as "Arabian Money-Changers," "Pilgrims to Mecca Resting," "Bedouins in Camp," "Camel Mart," "Young Copt Woman" (New Pinakothek, Munich). Other works include "The Inundation in Vienna, 1862;" "Old Little Matron" and "Last Task of the Day" (both in the Vienna Museum); and "Soldiers in the Thirty Years' War" (Prague Gallery).

MÜLLER, LUCIAN (1836-98). A German Latinist. He was born at Merseburg, and studied at the universities of Berlin and Halle. In 1870 he was made professor of the Latin language and literature at the Philologico-Historical Institute at Saint Petersburg. His works, which display great erudition and critical acumen, are marred by his bitter attacks on eminent scholars whose opinions differ from his own. They include his famous *De Re Metrica Poetarum Latinorum præter Plautum et Terentium* (2d ed. 1894); editions for the *Bibliotheca Teubneriana* of Horace (2d ed. 1879); of Catullus (1870); and other Latin poets; editions of Lucilius (1872); Phædrus (1877); Ennius (1884); Nævius (1885); Horace's *Odes and Epodes*, with German commentaries (1882); and Horace's *Satires and Epistles* (1841-43). His treatise entitled *Ein Horazjubiläum* (1892) contains a short autobiography.

MÜLLER, MAX. See **MÜLLER, FRIEDRICH MAX.**

MÜLLER, MORTEN (1828—). A Norwegian landscape painter, born at Holmestrand on the Christiania Fjord. After studying in Düsseldorf (1847-50), first under Tidemand and Gude, then at the Academy under Schirmer, he lived in Stockholm, and in 1866 went to Christiania, where he conducted a school for painting, subventioned by the Government. In 1871 he removed again to Düsseldorf, and in 1874 was made a member of the Stockholm Academy and Court painter. The rugged grandeur of the fjords and mountainous woodland fastnesses of his native country are the favorite subjects of his characteristic landscapes, in which he combines a romantic conception of nature with purely realistic color effects. Representative examples are a "View on Christiania Fjord" (1855), and "Entrance into Hardanger Fjord" (both in the National Gallery, Christiania); "Pine Forest in Norway" (1860, Hamburg Gallery); "Romsdal

Fjord" (1876); and "Forest Lake by Moonlight" (1892).

MÜLLER, OTTO FRIEDERIK (1730-84). A Danish zoölogist, born in Copenhagen. His contributions to the knowledge of Infusoria are especially valuable. He wrote: *Fauna Insectorum Friedrichsdaliana* (1764); *Flora Friedrichsdaliana* (1767); *Vermium Terrestrialum et Fluvialium, seu Animalium Infusorium, Helminthecorum et Testaceorum non Marinorum Succincta Historia* (1771); *Zoologica Danica* (1779-1806).

MÜLLER, OTTO (1816-94). A German novelist. He was born at Schotten, Hesse; was for some time connected with the Court library at Darmstadt, and edited newspapers at Frankfurt and Mannheim. In 1854 he established the *Frankfurter Museum*. He was the author of *Charlotte Ackermann* (1854); *Der Stadtschulheiss von Frankfurt* (3d ed. 1878), treating of Goethe's grandparents; *Aus Petrarca's alten Tagen* (1861); *Der Majoratsherr* (1873); and *Schatten auf Höhen* (1881). Consult the biography, by Schulte vom Brühl (Stuttgart, 1895).

MÜLLER, PETER ERASMUS (1776-1834). A Danish theologian and antiquary. He was born at Copenhagen, and studied at the university there, passing his theological examination in 1791. After spending some time in the German universities, he visited France and England. Returning, he wrote numerous works; was appointed professor of theology at the University of Copenhagen in 1801, and in 1830 became Bishop of Zealand, the highest ecclesiastical dignity in Denmark. He was an eminent theologian, and his theological works, including that on the Christian moral system (1808) and other volumes, are very highly valued. But his literary reputation rests upon his essays on Danish and Norse antiquities, of which the most valuable are: *Om det islandske Sprog's Vigtighed* (1813); *Kritisk Undersøgelse af Danmarks og Norges Sagnet* (1823-30); and, above all, his *Sagabibliothek, or Library of the Sagas* (1816-18).

MÜLLER, VICTOR (1829-71). A German historical painter, born in Frankfurt. First instructed there at the Städel Institute by Steinfeld, he studied afterwards at the Antwerp Academy and under Couture in Paris. Soon, however, he became a follower of Courbet, whose technique, the reverse of Couture's, he adopted, and subsequently helped to promote in Germany. In 1858 he returned to Frankfurt, where he soon attracted attention with a series of pictures, thoroughly realistic in conception and of great coloristic charm, but scarcely understood by a public accustomed to the sentimental trend of the Düsseldorf school of that period. He therefore, in 1860, removed to Munich, where such revolutionary departures from traditional treatment as the "Sleeping Wood-Nymph" (1863), or "Hero and Leander," were more likely to be appreciated. Out of a cycle from Shakespeare, which he painted there, "Hamlet in the Graveyard" (1869) is surpassed only by the "Balcony Scene in Romeo and Juliet" (New Pinakothek, Munich). To his influence as a colorist was due not only the introduction of the tone-element into the paintings of the Munich school, but also the truer conception of historical characters and a more wholesome observation of nature among the younger generation of artists.

MULLETS AND ALLIES

1. GULF SILVERSIDES (*Menidia peninsulae*).
2. BARRACUDA (*Sphyræna barracuda*).
3. COMMON MULLET (*Mugil cephalus*).
4. SLIMEHEAD (*Beryx splendens*).

5. SAND-EEL (*Ammodytes Americanus*).
6. CALIFORNIA 'SMELT' (*Atherinopsis Californiensis*).
7. AMERICAN SURMULLET (*Mullus auratus*).
8. GULF BARBUDO (*Polydactylus Virginicus*).

MÜLLER, WENZEL (1767-1835). An Austrian composer, born at Tyrnau, Moravia. He was a pupil of Dittersdorf, and from 1813 was kapellmeister at the Leopoldstadt Theater, Vienna. He wrote more than two hundred operas, besides symphonies, cantatas, and masses. His compositions include: *Das verfehlte Rendezvous* (1783); *Das neue Sonntagskleid* (1793); *Die Schwestern von Prag* (1794); and *Asmodi oder das böse Weib und der Satan* (1834).

MÜLLER, WILHELM (1794-1827). A German poet, excelling in popular and political songs that attracted great composers, notably Schubert, and also influenced Heine's lyric development. Müller, who was born in Dessau, October 7, 1794, studied philology and history, fought in the War of Liberation, visited Italy (1817-19), was made professor in the Gelehrtschule at Dessau (1819), and ducal librarian there. He died in Dessau, September 30, 1827. His poems, published under the titles *Müllerlieder* (1818); *Gedichte eines Waldhornisten* (1821); *Lieder der Griechen* (1821-24); *Lieder des Lebens und der Liebe* (1824); *Lyrische Reisen* (1827), were collected with other Works by Schwab in five volumes (1830). A new edition by Müller's son, the Orientalist, Max Müller, appeared in 1868; the *Poems* were published in one volume (1874).

MULLER, WILLIAM JOHN (1812-45). An English landscape and figure painter, born at Bristol. He studied with James Pyne, landscape painter, and in 1833 exhibited for the first time at the Royal Academy, the "Destruction of Old London Bridge, Morning." He spent seven months traveling in Germany, Switzerland, and Italy, and in 1838 he visited Greece and Egypt. In 1841 he published his "Picturesque Sketches of the Age of Francis I." and joined the Government expedition to Lycia, the results of which were paintings of Oriental life and scenery, five of which were exhibited at the Royal Academy in 1845. Among these are "The Tent," "Xanthus," the "Burial-Ground at Smyrna," and "Head of a Cingari." In the National Gallery are some fine Welsh landscapes, and a clever Lycian sketch, both in oil, and in the South Kensington Museum are several water-color drawings. Muller died at Bristol. His art was original, his selections were good, his color was pure and strong.

MÜLLER, mu'lër, WOLFGANG (called Müller von Königswinter) (1816-73). A German poet and novelist, born at Königswinter on the Rhine. He studied medicine at Bonn, and practiced at Düsseldorf, but afterwards removed to Cologne, and gradually gave up medicine to devote himself to literature. Müller's poetry finds its material in the Rhine, its beauty, its legends, and the life of its people. The more important of his books are: *Gedichte* (1847; 3d ed. 1868); *Der Rattenfänger von Sankt Goar* (1856); *Liederbuch* (1857; 4th ed. 1871); *Lorelei*, an epic cycle (1851; 4th ed. 1873); *Erzählungen eines rheinischen Chronisten* (1860-61); and *Im Rittersaal* (1874). His best-known poem is "Mein Herz ist am Rhein." Six volumes of his selected poems were published under the title *Dichtungen eines rheinischen Poeten* (1871-76). Consult Joesten, *Wolfgang Müller* (Cologne, 1895).

MÜLLER - GUTTENBRUNN, gu'ten-brun, ADAM (1852-). An Austrian author, born at Guttenbrunn, and educated at Hermannstadt and Vienna. In 1879 he removed to Vienna from

Linz. His first success was *Des Hauses Fourchambault Ende* (1880), supplementing Augier's drama *Les Fourchambaults*. This was followed by *Im Banne der Pflicht* (1882), the comedy *Schauspielerei* (with Laube, 1883), and *Irma* (1885). Among his novels and stories, which for the greater part appeared serially, the best-known are: *Frau Dornröschen* (1884; 3d ed. 1891); *Gescheiterte Liebe* (1889); and *Die Magyarin* (1896).

MULLET (OF., Fr. *mulet*, diminutive of *mulle*, from Lat. *mullus*, red mullet). Any one of a variety of useful fishes, principally of the family Mugilidae. In this family the body is nearly cylindrical, with large scales and two widely separated dorsal fins, the first with four stiff spines. The mouth is small. The best-known mullets belong to the genus *Mugil*, of which there are many species found in all warm waters. The common or 'striped' mullet (*Mugil cephalus*) is the largest (10 to 12 pounds) and best of all. It occurs on both coasts of America, and also in Europe. It often ascends rivers, and searches for soft or fat substances for food, frequently obtained by thrusting its mouth into the mud. It is easily reared in ponds, readily answers the call which usually summons it to be fed, and was in great request among the ancients. Mulletts are used fresh, salted, and smoke-dried. A preparation of their roe, called 'botarcha,' is in great esteem as a condiment in Italy and the south of France. They are often caught in the Mediterranean by angling from a rock, with a bait paste, when they have been previously attracted to the spot by macaroni thrown into the water. The white or 'blueback' mullet (*Mugil curema*) is found on both shores of America, and is of importance as a food fish. An abundant species about the Florida Keys is the 'fan-tail' mullet (*Mugil trichodon*). Mulletts are very numerous in surface-swimming shoals in the lagoons of the Gulf Coast in late winter and spring, and are captured generally by means of casting nets. Among the fishermen of Spanish America, mulletts are called 'liza,' 'lizita,' and 'macho,' with descriptive adjectives for the various species.

The name is also given in the Western and Southern United States to various suckers of the genus *Moxostoma*. Consult Goode, *Fishery Industries*, sec. i. (Washington, 1884). See Plate of MULLET AND ALLIES.

MULLET (OF. *molette*, *mollette*, Fr. *mollette*, rowel, from Lat. *mola*, millstone). In heraldry, a charge in the form of a star, generally with five points, intended to represent a spur-rowel. See CADENCY.

MULLIGAN LETTERS. A series of letters written by James G. Blaine (q.v.) to Warren Fisher, a business associate, which, it was alleged, proved corrupt connection, on the part of Blaine, with legislation in Congress favoring the Little Rock and Fort Smith Railroad and the Northern Pacific Railroad. The letters were obtained from Fisher by one James Mulligan, a former clerk of Fisher, who had been called to Washington to testify before a committee of the House of Representatives appointed to investigate the charges against Blaine. Blaine obtained the letters from Mulligan, and on June 5, 1876, read them before the House, after defying the committee to compel him to surrender them. The

letters were freely used in the Presidential campaigns of 1876 and 1884 by the opponents of Blaine, who took full advantage of the suspicious sound of several detached sentences. By the adherents of Blaine it was asserted, apparently with good reason, that the letters did not in any way prove corruption or even participation in discreditable business and political transactions on the part of Blaine.

MULLINGAR, mül'lin-gär'. The capital of County Westmeath, Ireland, on the Brosna, 50 miles west by north of Dublin, with which it is connected by rail and by the Royal Canal (Map: Ireland, D 3). The most important horse and cattle fairs in Ireland are held here periodically. It has a cathedral and infantry barracks. Population, in 1901, 4500.

MULLINGER, mül'lin-gēr, JAMES BASS (1834—). An English historian, born at Bishop Stortford. He was educated at University College, London, and at Saint John's, Cambridge, where he graduated with high honors. After lecturing at Bedford College, London, he was made librarian and lecturer on history in Saint John's College, and for four years he was lecturer on ecclesiastical history in Trinity College (1890-94). He wrote: *The Ancient African Church* (1869); *The Schools of Charles the Great* (1876); *An Introduction to English History* (with Gardiner, 1881); *The Age of Milton* (with Masterman, 1897); and a *History of Saint John's College, Cambridge* (1901).

MULLION (corrupted from *munnion*, from Fr. *moignon*, stump of an amputated limb, from OF. *moign*, from Lat. *mancus*, maimed; probably influenced by popular etymology with Eng. *mullet*, five-pointed star). The name for a vertical architectural member used to subdivide an opening, such as a window or the bay of a gallery, into two or more divisions within the main framework. It was practically unknown to all ancient styles of architecture. In the early Christian (especially Syrian), Byzantine, and Romanesque styles it occurs with increasing frequency in the very simple form of a circular shaft or colonnette (sometimes a small pier), subdividing a window into two arched openings or the bay of a gallery into two arcades.

It was in the Gothic style that the mullion received its true elaborate development through the use of tracery combined with the enormous increase in the size of windows and other openings, necessitating the multiplication of minor members. The orthodox cathedral window has three mullions forming four subordinate sections, and their profiles are varied and rich, being often a group of shafts and a composition of fillet and cavetto moldings. These Gothic mullions are exquisitely slender and far removed from the heavy pre-Gothic mullion-colonnette, though the column, in more delicate form, was also a Gothic form of mullion. The Renaissance architects abandoned the mullion, returning to the antique idea of undivided openings and equally divided arcades and colonnades. Only occasionally is a single colonnette used as a window-mullion, especially in early work.

MÜLLNER, mül'nēr, ADOLF (1774-1829). A German dramatist and critic, born at Langendorf, near Weissenfels, Saxony. He studied law in Leipzig, and practiced it at Weissenfels until 1816. Encouraged by the success of several come-

dies skillfully composed after French models, he produced in 1812 a one-act tragedy, *Der neun- undzwanzigste Februar*, in imitation of Werner's *Der vierundzwanzigste Februar* (1810), the first of those 'fate-dramas' with which the German stage was flooded during the following decade. Surpassing its model in the accumulation of horrors, Müllner's play lacked the innate poetry which was the redeeming feature of Werner's production. The same applies to his best-known work, *Die Schuld*, a four-act drama, based on the story of a young man, who, according to a prophecy, is destined to kill his brother. This typical 'fate-tragedy' was brought out in Vienna in 1813, and subsequently on all the principal stages of Germany, retaining its popularity for many years, although its effectiveness was due mainly to clever technical construction. Consult: Höhne, *Zur Biographie und Charakteristik Müllners* (Wohlau, 1875); and Minor, *Die Schicksals-tragödie in ihren Hauptvertretern* (Frankfort, 1883).

MULOCK, mū'lōk, DINAH MARIA. An English author. See CRAIK, DINAH MARIA.

MULOCK, Sir WILLIAM (1843—). A Canadian statesman, born in the Province of Ontario, and educated at the University of Toronto. In 1882 he was elected a Liberal member of the Dominion House of Commons, and in 1896 was made Postmaster-General in the Administration of Sir Wilfrid Laurier. The establishment of a penny postage rate between Canada and other portions of the Empire was mainly due to him, and he also advocated an all-British cable system, and the formation of better steamship facilities.

MULREADY, WILLIAM (1786-1863). An Irish genre painter. He was born at Ennis, County Clare, April 1, 1786. His father moved to London when Mulready was a child, and he early showed artistic powers which were encouraged by the sculptor Banks, through whose influence he gained admittance to the academy schools. His education and culture were obtained in England, for he never went abroad, and as a genre painter he ranks with Wilkie. His first painting of importance, "Returning from the Ale House," appeared in 1809, while two later works, "Punch" and "Idle Boys," commanded very general attention. Mulready was elected an associate of the Royal Academy in 1815, and the following year, on the merits of his picture entitled "The Fight Interrupted," he was made Academician. From now on his works were eagerly awaited at the yearly exhibitions, their subjects being of the popular order, but painted with great carefulness and fidelity to detail. They were rather small in size, but rich in color, and closely resembled the Dutch school.

His most important works are in the South Kensington Museum and in the National Gallery. In the former are seventeen of his paintings, among them "Hampstead Heath" (1806); "Giving a Bite" (1836); "Choosing the Wedding Gown" (1846); "The Butt" ("Shooting a Cherry") (1848). In the latter are six of his paintings, including a "Snow Scene" and "Crossing the Ford" (1842). "The Bathers" is in the National Gallery, Edinburgh, and his "Wolf and the Lamb" is in possession of the King. Mulready's paintings were before the public for

more than sixty years. An early marriage contracted soon after his arrival in London was productive of much unhappiness. He was, throughout his life, a successful and painstaking teacher. Mulready died in London, July 7, 1863. Consult Stephens, *Memorials of Mulready* (London, 1867).

MULTAN, or **MOOLTAN**, *mool'tān'*. The capital of a district of the Punjab, British India, 190 miles southwest of Lahore, and 4 miles from the left bank of the Chenab, the inundations of which sometimes reach the city (Map: India, B 2). It possesses railway communication with all the principal cities of India, and has, in the Indus Valley Railway, a commercial outlet from Central Asia, the Punjab, and the United Provinces, to the Arabian Sea at Karachi. Steamers ply to Hyderabad, a distance of 570 miles. The city, situated in a district remarkable for its fertility, is built on a mound consisting of the ruins of ancient cities, and is surrounded by a dilapidated wall from 40 to 50 feet high. The vicinity abounds in mosques, tombs, and shrines, attesting the city's antiquity and former magnificence. The most important of these, situated in the old fort, is the tomb of Rukn-i-Alam, 'pillar of the world,' dating from 1340, an octagonal red-brick structure covered with multicolored glazed tiles and raised mosaics, and forming a conspicuous object in the surrounding landscape, being 100 feet high and built on an elevation. The tomb of Bhawal Hakk, dating from 1264, and the tomb of Shams-i-Tabriz, are also noteworthy. The bazaars are numerous, extensive, and well stocked, and the stores are adequately supplied with European and Asiatic commodities. There are manufactures of silks, cottons, shawls, scarfs, brocades, tissues, etc., and extensive banking interests. The local merchants are proverbially rich. Multan is a military station, with an important cantonment one and one-half miles to the east. Multan was taken by the British in the second Sikh War, in January, 1849. Population, in 1891, 74,562; in 1901, 87,394.

MULTIPLE (ML. *multiplus*, manifold, from Lat. *multus*, many + *plus*, fold). An integral number divisible without remainder by another integral number. Thus, 35 is a multiple of 7, and also a multiple of 5. *Equimultiples* are multiples containing different numbers an equal number of times; e.g. 21 and 33 are equimultiples of 7 and 11. The *least common multiple* of several numbers is the least number containing each of them without a remainder. The least common multiple contains all prime factors not common to all of the numbers, and all common prime factors with their highest exponents. Thus, the least common multiple of 5·7 (i.e. 35), 3²·2 (i.e. 18), and 7²·2²·5 (i.e. 980) is 5·7²·2³·3² (i.e. 8820).

Mathematical symbols which satisfy given conditions for different numerical values are said to be 'multiple valued'; e.g. $\sin^{-1}x$ (i.e. the angle whose sine is x) is two-valued between 0° and 360°; thus, if the sine equals $\frac{1}{2}$, the angle has two values, 60°, 120°. (See TRIGONOMETRY.) Contacts above the first order between curves or surfaces are called 'multiple contacts.' A 'multiple point' of a curve is a singularity composed of several coincident points; e.g. if the curve crosses itself twice at the same place, the intersection is called a triple point. A double

point admits of two tangents, a triple point admits of three tangents, and so on, and these are called 'multiple tangents.'

MULTIPLE POINDING. A form of action in Scotland, by which competing claims to one and the same fund are set at rest. Its purpose is to avoid double poinding or double distress; and it corresponds to what is known in England as interpleader (q.v.).

MULTIPLICATION (Lat. *multiplicatio*, from *multiplicare*, to multiply, from *multiplex*, manifold, from *multus*, many + *plicare*, to fold, Gk. *πλέκειν*, *plekein*, to twine). A fundamental process in arithmetic and algebra. In arithmetic, the symbols for multiplication are $\cdot$, $\times$. In algebra, they are $\cdot$, $\times$, and simple juxtaposition. E.g. $a \cdot b$, $a \times b$, ab , are symbols for a times b . It may be defined as the process by which a number called the *product* is formed from a number called the *multiplier*, in the same way that this multiplier is formed from unity. E.g. the number -3 may be formed from unity by the process symbolized as $-(1 + 1 + 1)$, and similarly, the product $-3 \cdot 4$ may be formed by the process $-(4 + 4 + 4) = -12$. Elementary multiplication is subject to the associative and distributive laws (q.v.); but there are branches of higher mathematics in which exceptions occur. (See SUBSTITUTION; QUATERNIONS.) For a method of checking multiplication, see CHECKING.

In a series of operations, multiplication takes precedence over addition and subtraction. E.g. $2 + 3 \cdot 6 - 4$ equals $2 + 18 - 4$, not $5 \cdot 2$. The operation of multiplication can be abbreviated by the use of logarithms (q.v.), the slide rule (q.v.), or tables of products and factors or of quarter squares. The plan of multiplication by means of Napier's rods (*Rabdologia sive numerationis per virgulas libri duo*, Edinburgh, 1617) has been revived through the manufacture of sets of *Règlettes multiplicatrices* planned by Genaille and Lucas (Paris, 1885). Growing out of the demand for a system by which prime numbers could be detected, there appeared, in the seventeenth century, numerous tables, of service in the theory of numbers. In 1728 Poëtius published a table of factors for numbers up to 100,000. In 1770 Lambert arranged such a table in modern form for numbers up to 102,000. Burkhart's table (1814-17) includes factors of numbers to 36,000, and Crelle, Pase, and Glaisher have carried these to 9,000,000. The oldest of the large tables is that of Crelle (7th ed. with an introduction by Bremiker, Berlin, 1895). This gives the products to 1000·1000. Zimmermann's *Rechentafel* (Berlin, 1889) and Müller's *Multiplicationstabellen* (Karlsruhe, 1897) give the products to 100·1000, and are well arranged. For the products to 100·100, Jordan's *Mathematische und geodätische Hilfstafeln* (9th ed., Hanover, 1895) is one of the best. Products have also been tabulated by means of quarter squares, a relation known to the Arabs and doubtless of Hindu origin. The construction of these tables depends upon the identity $ab \equiv \frac{(a+b)^2}{4} - \frac{(a-b)^2}{4}$; thus the product of any two numbers is given by subtracting the quarter square of their difference from the quarter square of their sum. Among the various tables of this

type, Laundry's (1856) contains the quarter squares of all numbers up to 100,000. Blater's (Vienna, 1887), complete to 200,000, is regarded as the best. See CALCULATING MACHINES.

MULVANEY. A character in Rudyard Kipling's "Soldiers Three" in *Plain Tales from the Hills* (1888). The trio are Terence Mulvaney, the Irishman, Learoyd, from Yorkshire, and Ortheris, the Cockney.

MUM. See BEER.

MUM'BO JUM'BO. A strange bugbear described by Mungo Park as common to the Mandingo towns of Africa, and used to discipline quarrelsome wives of the natives. The person assuming the character is clothed in a suit made of bark. After various rites the offender is seized by Mumbo Jumbo, stripped, tied, and whipped with his rod. The name is used in a wider sense of negro idols and fetishes.

MUM'CHOG (North American Indian name). A small minnow-like fish of sluggish tidal streams of the Eastern United States. See KILLIFISH.

MUM'MIUS, LUCIUS (c.185-130 B.C.). A Roman commander of plebeian birth. In B.C. 146 he was elected consul and placed in command of the war against the Achaean League. The first battle was decisive. It was fought near Corinth and resulted in the complete defeat of the Grecian allies. The cities of Corinth, Thebes, and Chalcis were plundered and then destroyed by the Roman troops. As trophies of his victory, Mummius caused many of the most valuable works of art to be sent to Rome. The surname of Achaicus was given to Mummius, and a triumph was decreed. Cicero speaks of Mummius as a blunt and plain but honest man, and says that, of all his enormous plunder, none was reserved for his own use. In 141 he was again elected consul. Nothing certain is known about his later life or his death, some writers saying that he died in exile at Delos, and others that his death occurred in Rome, and that his daughter received a dowry from the Senate.

MUMMY-CASE. In ancient Egyptian embalming, the case immediately surrounding the shrouded mummy. It was in the outlines of a human body and was made to fit the corpse. There were usually two mummy-cases for each mummy. The inner one was plain, while the outer one was covered with paintings and hieroglyphs, recounting the life and deeds of the dead. The material was usually cedar. The double case was inclosed in an oblong coffin, and this in its turn in a sarcophagus. See EGYPT, section on *Manners and Customs*; EMBALMING; SARCOPHAGUS.

MUMPS (from Dutch *moppen*, to cheat, from *mommen*, to mumble), **THE.** A popular name of a specific inflammation of the salivary glands described by nosologists as *parotitis*. It is an infectious, contagious disease, occurring as a rule in epidemics, although isolated cases are often seen. While it chiefly attacks children and adolescents, adults are not exempt.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands usually soon become implicated, so that the swelling extends along the neck to-

ward the chin. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than due attention to the bowels, and protection of the parts from cold, by the application of flannel or of cotton, is required, and the patient completely recovers in eight or ten days.

A singular circumstance connected with the disease is that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mammæ* in the female. The inflammation in these glands is seldom very painful or long continued, but occasionally the inflammation is transferred to the brain, when a comparatively trifling disorder is converted into a most perilous disease.

MUN, mèn, ADRIEN ALBERT MARIE, Count de (1841—). A French politician and author, leader of the Catholic Anti-Republican Party. He was born at Lumigny, studied at Saint Cyr, and fought in the Franco-Prussian War and against the Commune. Save for an interval (1879-81) he was a member of the House of Deputies from 1876 until 1893. Through his influence the power of the French clergy was thrown to the Boulangists. In 1892 he founded the league of the 'Sacré Cœur' and on the Pope's instructions promised to work with the Republic for reform if the Government would give up its atheism. Mun took a prominent part in the Dreyfus trial, forcing Billot, Minister of War, to concur in the judgment of the court. The French Academy elected him to its membership in 1897 to succeed Jules Simon.

MUN, THOMAS (1571-1641). An English merchant and economic writer, born in London. As a young man he was engaged in the Mediterranean trade, and in 1615 was appointed member of the committee, or director, of the East India Company. In 1621 he published *A Discourse of Trade, from England into the East Indies*, in which he defended the East India Company against the charge that it drained England of bullion. His most important book, *England's Treasure by Foreign Trade*, was published after his death in 1664. This work is the ablest of the writings of the mercantilists, and exercised great influence over the economic and political thought of the time, effectually refuting the Bullionist view, that only such foreign trade as yielded a direct balance of bullion was advantageous to the realm.

MUN'BY, ARTHUR JOSEPH (1828—). An English poet, born in Yorkshire. He graduated from Trinity College, Cambridge, and was called to the bar at Lincoln's Inn. *Verses New and Old* (1865) contained "Doris," a lovely pastoral. *Dorothy* (1880), a country story in elegiac verse, was immensely popular in England and the United States. Since then have appeared *Vulgar Verses* (1891), written in dialect; and *Susan: A Poem of Degrees* (1893). Munby defended his realism in an appendix to *Dorothy*.

MUNCH, mûpk. PETER ANDREAS (1810-63). A Scandinavian historian. He was born at Christiania, Norway, and educated at the University of Christiania. He became professor of

history at Christiania in 1841, and in 1861 was appointed historiographer and archivist of Norway. He maintained that three distinct dialects prevailed in the kingdoms of Norway, Sweden, and Denmark, and that the so-called Icelandic literature was really the production of ancient Norway. He held that the modern Icelanders keep one dialect, and the inhabitants of the Farø Islands another, of the ancient Norwegian. He rejected the term 'Icelandic,' for which he substituted 'Old Norse.' He published an *Old Norse Grammar*, an *Old Norse Reading Book*, and a *History of the Norwegian People* (8 vols., 1852-63), and edited a number of Icelandic works, including the elder *Edda* (1847), and the *Royal Mirror* (1848). His collected essays, edited by Gustav Storm, were published in four volumes (Christiania, 1873-76).

MÜNCH-BELLINGHAUSEN, мунк бѣллинг-һоу'зен, ELIGIUS FRANZ JOSEF, Baron (1806-71). An Austrian dramatist, known under the pseudonym Friedrich Halm. He was born at Craoow, studied jurisprudence, and held a number of Government offices in Austria. His first play, *Griseldis*, produced in 1834 (11th ed. 1896), was well received. It was followed by *Der Adept* (1836); *Camoens* (1837); *Imelda Lambertazzi* (1838); and *Der Sohn der Wildniss* (1843; 9th ed. 1894), a conspicuous success on all the stages of Germany, and known on the American stage under the name of *Ingomar, the Barbarian*. In 1854 appeared *Der Fechter von Ravenna*, his greatest work, which was greeted with universal applause. Of all his subsequent efforts the romantic comedy *Wildfeuer* (1864; 7th ed. 1896) alone brought him a renewal of his earlier triumphs. His collected works were published in eight volumes in 1857-64.

MÜNCHEN-GLADBACH, мун'кен-глат'бăċ. A town in Prussia. See GLADBACH.

MÜNCHHAUSEN, мунк'һоу-зен, HIEBONY-MUS KARL FRIEDRICH, Baron (1720-97). An adventurous German noble, born on his father's estate, Bodenwerder, in Hanover, where he died. He served in the Russian cavalry against the Turks (1737-39), and told marvelous tales of his adventures. These were first gathered in English by Rudolph Erich Raspe (q.v.), a German exile (Oxford, 1785), as *Baron Münchhausen's Narrative of His Marvelous Travels and Campaigns in Russia*. G. A. Bürger rendered this into German (1786), and in that language it gained universal popularity as a monument of methodical lying unparalleled in literature. Consult: Carl Müller-Fraureuth, *Die deutschen Lügengedichtungen bis auf Münchhausen* (1881), which shows that some of Raspe's tales are borrowed from Bebel's *Facetiæ* (1508), and others from Lange's *Deliciæ* (1765). Consult also Griesbach's introduction to a reprint of Bürger's translation (Stuttgart, 1890).

MUNCIE, мун'сі. A city and the county-seat of Delaware County, Ind., 55 miles northeast of Indianapolis: on the White River, and on the Cleveland, Cincinnati, Chicago and Saint Louis, the Lake Erie and Western, the Cincinnati, Richmond and Muncie, the Chicago, Indiana and Eastern, and the Chicago and Southeastern railroads, being the terminus of the last mentioned road, which maintains shops here (Map: Indiana, D 2). Intercommunication among the

various lines is furnished by a belt road that encircles the city. Muncie is the seat of Palmer University, and has a public library with 13,600 volumes, a fine court-house, and a city hospital. A public library building costing \$50,000 was nearing completion in 1903, and an appropriation has been made by Congress for a Government building to cost \$80,000. The city is situated in the natural gas belt of the State and is near deposits of coal, advantages that have contributed to its development as an important industrial centre, noted particularly for its extensive iron and steel interests. There are also large glass works, pulp and paper mills, canneries, and manufactories of lawn mowers, silver and silver-plate goods, underwear and clothing, handles, caskets, wheels and carriage woodwork, gas engines and supplies, etc. The municipality owns an electric light plant for street lighting. Population, in 1890, 11,345; in 1900, 20,942.

MUN'DA. An ancient town of Hispania in the country of the Turdetani, in modern Andalusia. It is noted for the victory gained here by Cæsar over the sons of Pompey in B.C. 45.

MUN'DAS, or MUNDA-KOLS. The inhabitants of Chota Nagpur, and one of the principal tribes of the Kolarian stock in Northeastern Hindustan. They are also known as Horo-hu. The Mundas are short of stature and very dolichocephalic. Monogamy is the rule, and the position of the wife is higher than with many Oriental peoples. Some writers use Munda as a general term for Kolarian (q.v.).

MUN'DAY, ANTHONY (1553-1633). An English poet, playwright, and compiler, born in London. In Rome he obtained material for *The Mirror of Mutabilitie* (1579), a moralistic effort in verse, and after some experience on the English stage he wrote tracts against the Jesuits and other Roman Catholics, particularly Edmund Campion. The best of his eighteen plays is *The Downfall of Robert, Earl of Huntingdon, Afterwards Called Robin Hood of Merrie Sherwoodde* (1598-99). Munday also translated French romances, wrote 'pageants,' such as *The Triumphs of the Golden Fleece* (1623), and verse, such as *A Banquet of Daintie Conceits* (1588).

MUNDÉ, мун'дă, PAUL FORTUNATUS (1846-1902). An American gynecologist, born in Dresden. He came to the United States with his father after the revolution of 1848-49, and in 1866 graduated at the Harvard Medical School. In the same year he volunteered as surgeon in the Austro-Prussian War, and he served in a like capacity with the grade of first lieutenant in the French campaign of 1870-71. He settled in New York City in 1873 as an obstetric specialist; in 1880 became professor at Dartmouth Medical College, and in the New York Polyclinic in 1882. He edited the *American Journal of Obstetrics* (1874-92), and wrote: *Obstetric Palpation* (1880); *Minor Surgical Gynecology* (1880); *Appendix to the Midwifery of Cazeaux and Tarnier* (1884); *Pregnancy and the Puerperal State* (1887); and *Diseases of Women* (1891).

MUNDELLA, ANTHONY JOHN (1825-97). An English statesman and philanthropist, born at Leicester, of Italian-Welsh descent. At eleven he began to learn his trade with a hosiery manufacturer; at twenty-three he was a partner with

a firm in Nottingham, and he prospered in the business. He was instrumental in forming the first arbitration court for the settlement of differences between employers and employed (1866), and he was elected to Parliament for Sheffield (1868). In Parliament he directed his energies toward the improvement of laws regulating factories and education, and was particularly successful in the lightening of women's and children's labor. In 1880-85 he was vice-president of the Council of Education under Gladstone, and he succeeded in passing a compulsory education act (1881), while as president of the Board of Trade (1886 and 1892) he started a labor department of which *The Labor Gazette* was the organ. In 1894-95 he was chairman of the Poor-Law Committee; he resigned from Parliament in 1894, but was recalled the following year and died while in service.

MÜNDEŃ, mün'den. A town of Southern Prussia, in the Province of Hanover, situated at the confluence of the Fulda and the Werra, 11 miles northeast of Cassel. It has a gymnasium and a palace in which a museum was opened in 1898. The chief manufactures are confectionery, hats, chemicals, and cigars. In the vicinity are coal mines and mill-stone quarries. Population, in 1900, 9236.

MUNDEN, JOSEPH SHEPHERD (1758-1832). An English comedian, now noted especially for Charles Lamb's well-known encomium, *On the Acting of Munden*. Born in London, he began life in a commercial position, but he early found a place on the provincial stage, and in 1790 made his appearance in London. His ability to 'make faces' was famous, and he was greatest in broad farce, though in serious parts he was not without success. Among his best characters were Sir Francis Gripe, Sir Peter Teazle, Old Dornton, and Sir Robert Bramble. He retired in 1824, and died on February 6, 1832, in London. Consult: Lamb, *The Essays of Elia* (1st series, London, 1823); *Memoirs of Joseph Shepherd Munden*, Comedian, by his son (ib., 1844); Hutton, in *Actors and Actresses of Great Britain and the United States*, ed. by Matthews and Hutton (New York, 1886).

MUNDO, mün'dó. A wild tribe in Cebú and the Panay Islands. See PHILIPPINE ISLANDS.

MUNDT, munt, KLARA. A German novelist, best known under her pseudonym Luise Mühlbach (q.v.).

MUNDT, THEODOR (1808-61). A German novelist and critic of the 'young German' school, husband of 'Luise Mühlbach.' In 1848 he became professor of history at Breslau, and in 1850 professor and university librarian at Berlin. He became first known by his *Madonna, oder Gespräche mit einer Heiligen*, a memorial of Charlotte Stieglitz. Mundt edited, with Varnhagen von Ense, Knebel's letters and posthumous works, and also published Luther's *Politische Schriften*. He wrote books of travel and romantically historical novels: *Carmela* (1844); *Mendoza* (1847); *Die Matadore*, etc. (1850); and also *Geschichte der Weltliteratur*; *Geschichte der Litteratur der Gegenwart* (1842); *Geschichte der Gesellschaft*; and a critical *Kunst der deutschen Prosa* (1837).

MÚNDURUCÚ, mōon'dōō-rōō-kōō'. A powerful tribe of the great Tupian stock (q.v.), residing chiefly about the confluence of the Tapajos

and Amazon, in North Central Brazil. They are variously estimated at from 30,000 to 40,000. The men are tall, athletic, broad-chested, and of light complexion, and their naked bodies are entirely covered with artistic tattooing. The women are pleasing in manner, with a natural and unconscious vivacity. Both sexes are noted for their honesty. The men practice agriculture and do beautiful feather work. The women are skillful in weaving cotton fabrics and hammocks. Besides their habit of preserving the heads of their enemies, which has gained them the name of Paiguize, or Beheaders, among the surrounding tribes, they have the custom of killing persons hopelessly ill or decrepit.

MUNGER, mūn'gēr, THEODORE THORNTON (1830—). An American clergyman. He was born at Bainbridge, N. Y., graduated from Yale College in 1851, and from the Yale Divinity School in 1855. The following year he entered upon the work of the Congregational ministry, serving first at Dorchester, Mass. He remained here until 1860, then devoted two years to travel and study, after which he resumed the ministry, locating in Haverhill from 1862 to 1870, and in Lawrence from 1871 to 1875. In the latter year he removed to California, and during the twelve months of his residence established a church at San José. Returning to the East, he became pastor at North Adams, Mass., where he remained until 1885, when he resigned to accept a call to the United Church, New Haven, Conn. He has published: *On the Threshold* (1880); *The Freedom of Faith* (1883); *The Appeal to Life* (1887); and *Horace Bushnell, Preacher and Theologian* (1899).

MUNGHER, mūn-gēr'. A town of India. See MONGHYR.

MUNGO. See SHODDY.

MUN'GO, SAINT (518?-603). The popular name of Saint Kentigern, one of the three great missionaries of the Christian faith in Scotland. Saint Ninian (q.v.) converted the tribes of the south; Saint Columba (q.v.) was the apostle of the west and the north; Saint Kentigern was the apostle of the Strathclyde Britons, who held the country between the Clyde on the north and the furthest boundaries of Cumberland on the south. (See STRATHCLYDE.) He is said to have been the son of a British prince and princess, and is believed to have been born at Culross on the Forth, near Perth, in 518. He planted a monastery on the site of Glasgow, and became the Bishop of the Kingdom of Cumbria (q.v.). The nation would seem to have been only partially converted, and persecution drove Saint Kentigern from the realm. He found refuge among the kindred people of Wales, and there, upon the banks of another Clyde, he founded another monastery and bishopric, which still bears the name of his disciple, Saint Asaph. Recalled to Glasgow in 573 by King Roderick the Bountiful, Kentigern renewed his episcopal and missionary labors, in which he was cheered by a visit from Saint Columba. He died January 13, 603, and was buried where the Cathedral of Glasgow, called Saint Mungo's, now stands. There is a fragment of a *Life* of Saint Kentigern written in the twelfth century, and a longer *Life* by Jocelyn of Furness, written about 1180. Consult Forbes, in *The Historians of Scotland*, vol. v. (Edinburgh, 1874).

MUNGOOS, or MONGOOSE (Telugu *mangisu*). The mungoo (*Herpestes griseus*) is a species of ichneumon (q.v.), a native of India, but introduced into other countries, notably Jamaica, for the purpose of destroying rats and other vermin, upon which it feeds. In India it is often kept about the houses to reduce the number of lizards, mice, rats, and snakes. It kills and eats the most poisonous snakes, such as the cobra, the bite of which is either avoided by the animal's agility or else is not fatal to it.

The mungoo was introduced into Jamaica in 1872, when nine specimens were imported to destroy the rats on a sugar plantation. At first they were highly beneficial, reducing the stated annual loss from rats from \$500,000 to one-half that, but in less than twenty years the island was almost overrun with them. Not only did they kill rats and mice, however, but snakes, lizards, ground-birds, and even poultry. At one time snakes had become so rare that they were regarded as practically exterminated, but since 1896 they are apparently on the increase. The ground-doves and other terrestrial birds, partly at least by change of habit, are also adapting themselves to this new enemy and their extermination is no longer to be feared. At the present time the mungoo is common and very tame in most parts of the island and in many other islands, and is generally looked on with favor.

The mungoo is from 15 to 18 inches long, and has a tail 14 to 15 inches in length, very thick at the base and tapering to a point. The fur is rather long and grizzly reddish-gray. A very full account of its habits is given in the *Royal Natural History*. For the details of its history in the West Indies, consult: Morris, *The Mongoose on Sugar Estates in the West Indies* (London, 1882); *The Field* (London) for July 13, 1895.

MUNICH, mū'nīk (Ger. *München*). The capital of Bavaria, and the third largest city in Germany, situated at an elevation of 1700 feet, mostly on the left bank of the Isar, on the southern border of a partly swampy and partly fertile forested plateau, 296 miles by rail south of Leipzig (Map: Germany, D 4); latitude 48° 9' N., longitude 11° 35' E. The city is only about 25 miles north of the Bavarian Alps, and is subject to a somewhat raw climate characterized by abrupt changes of temperature, which are at times trying. Mean annual temperature, 46° F.

Munich is comparatively modern. It is progressive and handsomely equipped with the latest municipal improvements, having, in fact, been mostly rebuilt since about 1830. It owes its artistic and regal appearance to the art-loving Louis I. and his successors. The very wide avenues and the many buildings constructed in all the leading styles of architecture lend great dignity to the metropolis. The streets are generally regular, and the city is lavishly adorned by numerous squares and pleasure parks and gardens. The largest park is the beautiful English Garden. It contains over 500 acres, watered by branches of the Isar and adorned with small temples, towers, etc. Magnificent thoroughfares are the Maximilianstrasse, lined by public buildings, and the Prinzregentenstrasse, both leading across the river to the Maximilian pleasure grounds on the opposite side. The Ludwigstrasse, stretching northward from the royal palace, is

also a splendid street, flanked with impressive Renaissance edifices.

The Max-Joseph-Platz, together with the Marienplatz, represents the centre of life in Munich. The former connects the old and new sections, and is embellished by Rauch's huge bronze statue of King Max Joseph. The Alte Residenz—one of the three parts of the royal palace—extends here along the north side of the square and has in the rear the Court gardens, with their open arcades and frescoes. This structure dates from 1596 and contains four courts, but is of little architectural worth. Its apartments, however, are a source of great interest to sightseers, being luxuriously furnished in the seventeenth century style and rich in historical associations. The throne room was at one time occupied by Napoleon. The royal chapel and the treasury possess numerous objects of intrinsic and historic value.

The other two parts of the palace are the fine Festsaalbau and the Königsbau. The latter, finished in 1833, and fashioned after the Pitti Palace, is notable for its splendid Nibelungen frescoes by Schnorr (1861). The former is a handsome edifice, completed in 1842 in the late Italian Renaissance. It is enriched with Ionic pillars and with allegorical figures of the Bavarian provinces. Several apartments contain Hiltensperger's frescoes from the Odyssey. Beautiful salons are also the throne room, with striking bronze statues by Schwanthaler; the Hapsburg room, with paintings; the Barbarossa Hall, with reliefs by Schwanthaler; and the Hall of Charlemagne, containing ambitious decorations descriptive of scenes from the Emperor's life. But the best known of these apartments are those containing Stieler's thirty-six portraits of beautiful women, painted from various types of Bavaria's fairest womanhood.

Connected with these royal edifices are the great Hof und National Theater dating from 1823, with an attractive portico borne by Corinthian columns, and containing seats for 2200 persons, and the artistic and impressive Court chapel—a structure dating from 1837, in the Byzantine-Romanesque, and having sumptuous decorations. Still another feature in connection with this royal residence are the coach houses and harness rooms, with a collection of historic carriages, sleighs, and sledges. Adjacent also are a valuable ethnographical museum, an Art Union, with works of living artists, and an instructive museum of plaster casts. Other palaces in the city are the palace of Prince Charles, the palace of Prince Regent Luitpold, the palace of Duke Max, with good decorations, and the royal Wittelsbach palace, an artistic red structure begun in 1843.

Munich has no churches of great fame. The Ludwigskirche is a rather attractive example of Italian Renaissance, and contains a noteworthy Last Judgment by Cornelius. The Saint Boniface basilica, dating from 1850, with some three score of gray marble columns, is also worthy of mention, as are the cathedral—the Frauenkirche—the Gothic Marienhilfskirche, and the Gothic Giesinger Church. The synagogue is one of the largest and finest in Germany. All these churches, except the cathedral, belong to the nineteenth century. Among the impressive secular buildings are the War Office, the Post Office, and the

new Gothic Rathaus, an attractive building completed in 1874.

The picture and sculpture collections of Munich are famous. The building of the Old Pinakothek, situated in the northern section of the city, not far from the royal palace, was constructed in 1826-36, in the Renaissance style. It is about 174 yards long, and is embellished on the exterior by statues by Schwanthaler. It contains about 1400 canvases. Almost all the great masters of paintings since Raphael's time are represented here by works of the highest excellence. The greatest gems perhaps are Dürer's Saints Peter, John, Paul, and Mark; several portraits and other pictures by Rubens, including the "Battle of the Amazons," the "Massacre of the Innocents," and the "Lion Hunt;" Perugino's "Virgin and Saint Bernard;" Raphael's "Madonna Tempi;" and Murillo's "Two Beggar Boys Eating Fruit." The Old Pinakothek contains in addition valuable cabinets of vases; also engravings and drawings. Its loggie are decorated by Cornelius. Adjacent on the north is the New Pinakothek, with a good collection of modern artists, mostly Bavarian. There are about 700 works. Here is found also an antiquarium with fine bronzes and terra-cottas principally from Rome and Greece. In the vicinity is also the Glyptothek—containing mainly a collection of ancient statuary. The edifice is of a classic and imposing Ionic pattern, graced with columns and artistically embellished. It has Assyrian and Egyptian departments, as well as departments devoted to excellent Greek and Roman examples and to incunabula. The highly prized collection of marbles from the island of Ægina is also in the Glyptothek. Its most valuable sculpture perhaps is the Greek Barberini Faun (B.C. 300).

In connection with the realm of art in Munich may be mentioned the Kunstgewerbehaus; also the Academy of Art, an ambitious edifice in Italian Renaissance, completed in 1885. The artists of Munich maintain in the so-called Exhibition Building (finished in 1845) a permanent exhibition of their paintings exposed for sale. The Bavarian National Museum, founded in 1855, and housed in a fine edifice, is of great value. Among its numerous collections covering many departments of human endeavor, the most valuable perhaps are the art works of the mediæval Renaissance and modern periods. The Schwanthaler Museum contains models of the master's works. A noteworthy picture collection also is the Schack Gallery, possessing choice originals, and interesting copies of the great masters by many of Germany's foremost modern painters. Other museums are the collection of pictures and drawings left by the painter Kaulbach, and the Lotzbeck museum of pictures and marbles. Munich is celebrated also as a musical centre, especially for German operas. The National Theater is one of the most important of modern operatic institutions, being intimately identified with the Wagner influence and tradition.

Among the many monuments not already mentioned are those of Louis I., Schiller, Gluck, Schelling, Fraunhofer, Gärtner; the large and striking monument to Maximilian II., dating from 1875; the fine statue of Elector Maximilian I., after plans by Thorwaldsen; an obelisk made of the metal of captured cannon, and erected to the memory of the Bavarian soldiers who died in

the war with Russia; the fine monument to Liebig, the chemist; the new and splendid Wittelsbach fountain; also the bronze Fischbrunnen, associated with the Butchers' Festivals. The Church of Saint Michael contains a fine monument by Thorwaldsen to Eugène Beauharnais. The Siegesthor—Gate of Victory—constructed in 1843 in honor of the Bavarian Army, is a splendid arch patterned after that of Constantine at Rome. It is surmounted by a huge figure of Bavaria. On the magnificent Königsplatz, near the Glyptothek, rises the Propylæa, an attractive portal completed with Doric and Ionic features in 1862—a tribute to the cause of Greek independence. Notable also is the ancient Isarthor, with elaborate frescoes. Still other objects worthy of visit in Munich are the Bronze Foundry and the Royal Arsenal, with an interesting military museum, containing relics of the Napoleonic wars.

At the head of the educational institutions is the celebrated university. (See MUNICH, UNIVERSITY OF). The city's educational system is scarcely surpassed either for comprehensiveness or excellence. The Maximilianeum on the right bank is an institution founded by Maximilian II. for advanced civil service instruction. It is surrounded by attractive Gasteig pleasure grounds extending along the river shore. The important Polytechnic School is in a fine modern edifice. Near by is an art industrial school. There are also in the city a military academy and a military school, an academy of science with noteworthy collections, and numerous organizations for the development of all the chief branches of knowledge and its application. Of the many valuable libraries, the Royal Library is by far the most important. Its spacious Florentine building was constructed after 1832, and possesses a magnificent staircase. The library is one of the largest in the world. It contains some 1,350,000 volumes, and over 30,000 manuscripts. It is especially rich in German documents and scholastic literature, possessing some of the rarest of literary editions and other specimens, including a translation of Boccaccio, a codex aureus (in gold letters and dating before 900), and Four Books of Gospels. In this library, also, are the archives of Bavaria—a collection of 500,000 documents. The city has a botanic garden, and a crystal palace, where expositions are held.

Industrially, Munich is important and prosperous. Its iron, bronze, and bell foundries, its lithograph and engraving establishments, its optical and mechanical instrument factories are celebrated, as are its enormous breweries (some 45 in number), which have made the city famous for excellent beer. The large, palatial Hofbräuhäuser are a feature of the city's social life. The other manufactures comprise cotton, wool, and damask goods, wax-cloth, leather, paper-hangings, carriages, pianos, gold and silver articles, machinery, steel wares, etc. In its manufacturing and commercial interests the city has made great strides in very recent times. Beer is the chief export. Also grain, hops, coal, wool, furniture, carpets, and art goods figure in the shipments. Munich has a network of canals for traffic—over 100 miles in length. Numerous important industrial and commercial unions and associations are established here.

Munich is the seat of all the important Gov-

MUNICH
LUDWIGSTRASSE (UPPER)
RATHAUS AND MARIENPLATZ (LOWER)

ernment institutions of Bavaria. It is administered by two burgomasters, about forty magistrates, and some seventy councilmen. The annual budget balances at approximately \$4,500,000. The municipal debt is about \$25,000,000, offset by nearly twice that amount invested in public property—mostly in buildings and grounds. Over a third of the taxes go to the service and reduction of the debt. The charitable institutions are excellent.

The popular festivals and 'Dults' (fairs) are a feature of Munich. They are all elaborate and interesting—for instance, the annual carnival, the Magdalen Festival in July, and the October Festival. The last is a kind of agricultural fair which attracts the picturesque country population. The environs are of no little interest. Their most unique attraction is the famous Bavaria, an immense bronze statue rising on a low elevation west of the city. It is a hollow female figure 62 feet high, and cast from the bronze of foreign cannon, according to designs by Schwanthaler. It was uncovered in 1850. From its head there is a good view of the city. The adjacent Hall of Fame is a Greek colonnade, dating from 1858. It holds about 100 busts of famous Bavarians, including Jean Paul and Schelling. The Nymphenburg is a royal château near the city. Its grounds are very attractive. The cemeteries of Munich are said to contain the most artistic tombs in the Empire. The population of the city has more than doubled in the last few decades. In 1871 it numbered 169,693; in 1900, 499,959, nearly all Catholics. The death rate fell from 30.4 to 24.1 in a thousand from 1871 to 1898.

HISTORY. The history of Munich may be said to date from the time of Henry the Lion, in the twelfth century. It grew rapidly under the House of Wittelsbach. The city was fortified in 1254, Otho the Illustrious having established his residence here. In the first half of the fourteenth century the library was founded. About the middle of the sixteenth century the art collections were begun. Munich became a royal residence in 1806. From the reign of Louis I. dates the city's present magnificence.

Consult: Kahn, *Münchens Grossindustrie und Grosshandel* (ib., 1891); Aufleger and Trautmann, *Alt-München in Bild und Wort* (ib., 1895); and the *Jahrbuch zur Münchener Geschichte* (ib., 1887 et seq.).

MUNICH, UNIVERSITY OF. One of the leading German universities, founded by Duke Ludwig of Bavaria with the approval of Pope Pius II. as a Studium Generale at Ingolstadt. The members of the faculties took an oath of loyalty to the See of Rome. Though the bull authorizing the opening of the institution was issued in 1458, it was not opened until 1472. True to its pledge, Ingolstadt University remained faithful to the Church of Rome during the trying period of the Reformation. In 1556 the Jesuits gained control of the university and conducted it until their suppression in 1773, though Ickstatt labored from 1746 to remove them. At the instance of Ludwig Maximilian, whose name the institution now bears, it was moved in 1800 to Landshut, where it remained until 1826, when it was transferred to Munich and reorganized. In addition to the collections and institutes brought thither from Landshut, the Government transferred to the university the botanical garden,

anatomical theatre, observatory, and antiquarium, and a valuable collection of coins. In 1902 the university consisted of the faculties of theology, law, political science, medicine, and philosophy, with an attendance of 175, 1324, 159, 1095, and 1450 respectively. The university also includes a number of seminars, clinics, museums, a botanical garden, and an observatory. The University Library contains over 400,000 volumes and about 2000 manuscripts. The Collegium Georgianum, founded in 1494 for the education of Catholic priests, and the Maximilianum, founded in 1852 and opened in 1876, for the education of talented Bavarian youth, are affiliated with the university. The income of the university is about \$250,000 a year, the greater share being contributed by the Government. The number of professors in 1902 was 117, besides 83 privat-docenten, including such illustrious men as Hermann Paul, the eminent philologist Von Zittel, and Röntgen.

MUNICIPAL ARCHITECTURE (Lat. *municipalis*, from *municipes*, citizens, from *munus*, duty + *capere*, to take). An important branch of civil architecture, that, namely, which has to do with buildings erected out of public funds for the use and amusement of the inhabitants of a city, or purely for the adornment of the city itself. The term is sometimes extended to include public and semi-public buildings for business or amusement erected by private capital, such as exchanges, railway stations, and theatres. It is doubtful if municipal buildings, properly speaking, existed in the prehistoric and the ancient Oriental worlds; the temple and royal palace filled all needs in these civilizations. The great city gates of ancient Babylonia and Assyria were the only structures in the Orient that could be included under the title of municipal buildings.

GREECE. With the development of Greek city life after the seventh century B.C. several classes of such buildings were erected. Among these may be named the *Theatre* (q.v.), which was always erected with public funds, and which first began early in the fifth century B.C. to be built of stone and in the form and style recognized in the ruins of those at Epidaurus, Athens, Sicily, etc. Of Greek buildings devoted to public games and sports, the most important were the *Stadium* (q.v.) and the *Hippodrome* (q.v.) for the different kinds of races, neither of which gave opportunity for much distinctive architecture. The *Gymnasium* and *Palestra* were devoted to contests requiring less space and to training and practice, and embodied most of the features developed later by the Romans in the Imperial *thermæ*. Those at Ephesus and Alexandria-Troas are especially well preserved. The commercial centre of the city was the market-place, or *agora*, corresponding to the Roman Forum (q.v.), an open rectangular space bordered by colonnades and halls, and decorated with monumental entrances, statuary, and fountains. The various halls for the transaction of municipal business, such as the *Prytaneum* and the *Bouleuterion*, were often connected with the market-place, and there were frequently two *agoræ* in each city—the political and the commercial. Those at Priene, Assos, and other cities of Asia Minor are particularly important, as no well-preserved examples have been found in Greece itself. One

can judge of the great possibilities of the Greek columnar style even better from these many public porticoes than from the temples. Finally, the so-called *leschoi* were public halls for banquets and other reunions and celebrations. To the list of Greek municipal buildings should be added such decorative and memorial structures as the choragic monument of Lysicrates and the Tower of the Winds at Athens, public fountains, and the like.

ROME. The Romans developed municipal architecture even further in magnificence and variety after the second century B.C. Their theatres were richer in decoration; their amphitheatres were a new form altogether; their circus was architecturally more significant than the stadium and hippodrome. The Roman Forum, which was at first an irregular square without architectural beauty, was later bordered by basilicas (q.v.), great halls for commercial and judicial purposes, while memorial and triumphal arches were placed at its entrances and along its main road. Rome was embellished with new fora by successive emperors, these gifts culminating in the stupendous Forum of Trajan, with its basilica, temple, arch, and triumphal column. In the early days of the Empire a new type of city was developed, in which the various main groups of public buildings were united and harmonized by vast stretches of porticoes. Such porticoes in Rome itself were the Porticus Maximæ, extending to the Tiber, and the mile-long Porticus Triumphalis in the Field of Mars. They masked the poorer streets. In the cities of Syria and the rest of Western Asia a great era of rebuilding set in, the old blank-walled main streets being replaced by colonnaded boulevards, decorated with statues and intersecting at right angles. This type, which originated at Antioch, can now best be studied at Palmyra, Gerasa, and other cities near the coast-line.

The many new Roman colonies and municipalities in North Africa and Syria gave even more occasion than the old cities for the carrying out of a regular plan of municipal architecture. The cities of Theveste and Thamugadi are important examples. Pompeii gives an older type. The Pompeian Forum, with its well-preserved basilica; its *curiæ* or municipal meeting-halls, with their colonnades; its Temple of Jupiter, flanked by memorial arches; its 'Pantheon,' with the money-changers' shops; its market-hall. Temple of Venus, lounging-gallery, and other well-grouped structures, shows how the government of a provincial town of moderate size grouped the public buildings around its main square.

Of the theatres, those at Aspendos in Asia Minor, and Orange in France, are the best preserved; of the amphitheatres, those of Rome (the Colosseum), Verona, Capua, Arles, Nîmes, and Thysdrus; of the basilicas, those of Maxentius in Rome, of Pompeii, and of Treves.

With the decline of Roman power and the transfer of the capital to Byzantium, the focus of activity in municipal architecture was shifted and Constantinople, or New Rome, became the scene of an extraordinary work of reconstruction under Constantine, Theodosius, and (later) Justinian. Fora, palaces, triumphal arches, colonnades, basilicas, baths, and churches gave splendor to the new city, though less perfect in detail than the best Roman works. Meanwhile, until the final overthrow of the older capital, public buildings, porticoes, and basilicas were still be-

ing erected in Rome, and the majestic ruins of the Basilica of Maxentius and Constantine attest the importance of these expiring efforts of Roman art. After the fifth century there was nothing but lethargy in municipal architecture until the later Middle Ages.

MIDDLE AGES. The growth of municipal architecture in the Middle Ages was very gradual and depended largely upon the character of city government. In the monastic and feudal cities there were no works of municipal architecture of any importance. Conditions were more favorable to the erection of municipal buildings in the free communes and episcopal cities, which possessed complete or partial autonomy.

The most important municipal buildings were the hôtel-de-ville in France, the Rathaus in Germany, and the *palazzo pubblico* or *comunale* in Italy. The cities of Northern and Central Italy, of Northern France and the Netherlands, of Northern Germany (especially the Hanseatic League), were most conspicuous for such buildings during the Romanesque and Gothic periods. The plan of the communal palaces varied according to whether the local constitution provided for meetings of a large body of citizens or only of a select few inside the building. The Doge's Palace in Venice had halls for the Gran Consiglio and others for the Council of Ten and the smaller council. At the more democratic Padua, the immense hall, with its wagon roof—the largest in Europe—provided for larger meetings. At Udine and Piacenza are the best examples of a whole lower story open in vaulted arcades for the popular meetings, with halls on the second floor for the smaller committees. These palaces in Lombardy were usually termed *broletti* (Como, Bergamo, Cremona, Monza, etc.). The main meeting room on the second floor was nearly always provided with a balcony or *ringhiera*, from which announcements were made to the people.

The cities of Tuscany and Umbria, later in achieving independence (except Pisa), erected, however, even more magnificent public palaces than their northern neighbors. The Palazzo Vecchio and Bargello in Florence, the Palazzi Pubblici at Siena and Perugia, built during the Gothic period (1250-1350), are the largest in Italy and especially remarkable for magnificent towers. Hardly a city in Italy, even one enjoying but a modicum of administrative autonomy, but had a public palace of some sort, and in some cities there were two palaces, the episcopal and the civil.

Such communal palaces were much rarer in feudal France: they are almost wholly wanting in the southern and central provinces. But the powerful cities of the Netherlands, Lille, Louvain, Mechlin, Brussels, Ghent, Bruges, Ypres, Arras, and Liège, built as magnificent public palaces as their Tuscan compeers. That of Brussels, with its great central towers, is a fine example in the developed Gothic style. Germany is particularly rich in such buildings, not on as large a scale, certainly, but interesting from their very number. Municipal belfries (q.v.) or *campanili* were prominent in many cities of both Northern Europe and Italy.

The communal organization in the cities was usually based upon the association of the labor and trade guilds. It was the officers of these guilds who, coming together for mutual benefit, originated in most cases the city administration

and constitution. Many of these guilds had separate buildings for their meetings and they usually repeated on a smaller scale the architectural features of the communal palaces. The Loggia dei Mercanti at Bologna, those at Ancona and Perugia, the Or San Michele at Florence, are a few among many. The lawyers' guild sometimes built sumptuously, as in the Palazzo dei Giureconsulti at Cremona. In the case of some of the very powerful Flemish guilds, such as the cloth guild, their buildings equaled or surpassed the average town-hall; this was the case at Ypres. In some cases the governing body had a separate palace from that where the popular meetings were held. Thus at Pistoia there was a Palazzo del Comune and also a Palazzo del Podestà. Other associations besides the guilds erected common halls: the religious fraternities, such as that which built the Bigallo in Florence, or the various beautiful buildings in Venice. Hospitals, like the Ospedale degli Innocenti in Florence, the Hospital at Milan, and the Misericordia at Arezzo, are distinctly public monuments.

The most important of the minor works of municipal architecture were the bridges (q.v.), fountains (q.v.), and gates. The first two classes have been treated under their separate heads, so that it will be necessary to describe only the city gates. During the Middle Ages the fortification of cities by heavy walls was a universal custom and the gates were fully as important as the triumphal arches and gateways of Roman cities. The great gate at Lübeck and several gates at Florence show the German and Italian styles. They were usually dedicated to a saint and contained a shrine and frescoes or carved images in the central opening; guardrooms on the sides and above contributed to making the gate a monumental structure. The round or pointed single archway was often flanked by two towers, as in the Porta della Vacca at Genoa.

In so far as the general arrangement of the larger mediæval cities is concerned, the Cathedral Square was the main centre of the city, the market-place and a place of resort; but wherever there was also a strong municipal civic organization there was also a second square dominated by one or more city buildings and kept free for public assemblies. Seldom do we find a single square used for both classes of buildings.

MOHAMMEDAN. There was far more of municipal architecture in the mediæval Mohammedan cities of the Orient than Europeans realize. The *bazaars* with their long covered galleries rivaled the gallery arcades of modern cities; the *khans* and *caravanserais* with their immense courts were often on a colossal scale. Numberless *sebils* or fountains were dotted through the streets. The city gates were monumental. The *alcazars* were an interesting combination of governmental palace and fortress. There were numerous hospitals and colleges with attached mosques and mausoleums, as at Ispahan. Few European cities showed so ample a display as Bagdad, Cairo, Damascus, Adrianople, Constantinople, or even the mediæval cities of second rank, like Fez, Kairwan, Emesa, and a hundred more. The Mohammedan engineers in Western Asia were famous for their bridges, fortifications, and castles. The great wealth and advanced culture of the Arabs, Moors, and Persians, and of the Moslem Hindus—far superior to that of the West in the Middle Ages—made it easy to build up

beautiful cities, now all reduced to squalor and ruin.

RENAISSANCE. While the Renaissance was more fruitful in works of private and religious architecture than in municipal architecture, a great number of notable buildings were erected for public purposes in the cities of Italy and of Western Europe. The general downfall of civic liberties checked the progress of some phases of municipal architecture, but the change of style ushered in by the Renaissance led to the erection of many new edifices in the more modern style. Thus in Italy the elegant town hall at Verona (Palazzo del Consiglio), by Fra Giocondo (1470); the town hall at Padua, the Loggia del Papa at Siena, the Procurazie Vecchie at Venice, belong to the fifteenth century; to the sixteenth, the Library of Saint Mark, and the Loggetta of the Campanile (demolished by the fall of the tower, 1902), at Venice, the magnificent arcade surrounding the ancient 'Basilica' at Vicenza, by Palladio, and many loggias and administrative palaces in other cities. The Hôtel-de-Ville at Paris (1546), the town halls of Rheims, Rouen, and other French cities, and even of small towns like Beaugency, erected in the sixteenth century; the great town halls of Antwerp and of several Dutch cities, and the picturesque *Rathäuser* or council halls of Bremen, Nuremberg, Altenburg, Cologne, and other German cities, prove that there was still opportunity for effective and beautiful municipal buildings. Fountains were also multiplied, often of great elaboration and sculptural splendor. (See FOUNTAIN.) In the seventeenth and early eighteenth centuries there developed a remarkable movement for the embellishment of cities by the decorative treatment of open squares and spaces. Of this movement the piazza in front of Saint Peter's, with its colonnades, obelisk and fountain, and the Piazza del Popolo, both at Rome, and the Place de la Concorde and Place Vendôme at Paris, are the finest examples. It was in the eighteenth century that a new era of municipal architecture commenced in Germany with the transformation of Berlin under Frederick the Great, followed by that of Munich in the first half of the nineteenth century, and then by that of Vienna, and that of Paris by Baron Haussmann under Napoleon III. New classes of buildings were developed and erected: museums, picture and sculpture galleries, halls of fame, theatres, and public educational buildings. Every style of architecture was employed, but mainly the neo-classic and neo-Renaissance. The triumphal arch again came into vogue. Great boulevards became the fashion. The old-fashioned narrow streets were discredited, even in Italy. The sun was let in everywhere.

RECENT DEVELOPMENT. EUROPE. Of the more recent development of municipal architecture, Paris, Vienna, and Budapest stand out as the most conspicuous examples; but Berlin, Munich, and other German cities, Rome and Naples, and in less degree many other cities in Europe have undergone a process of architectural remodeling. The great operations undertaken by Napoleon III. in Paris under Haussmann's direction included not only the reform of the city's street-plan, but also the erection of many public buildings. This work, interrupted by the fall of the Empire, was resumed under the Republic, and has been steadily prosecuted ever since, at

the joint expense of the city and State. The new Opera House, the reconstructed Palais de Justice, the Tribunal de Commerce, the completed and remodeled Louvre, the Saint-Michel Fountain, and since the war of 1870-71 the new Hôtel-de-Ville, Sorbonne (university), and Ecole de Médecine, the demolition of the ruined Tuileries and creation of new gardens on its site, the two new art palaces, and the Alexander III. and other bridges, are the monuments of this remarkable activity. So the new Reichstagsgebäude (Parliament-house), the Museum, the various columns of victory and other monuments, including the recently built Sieges-Allee, at Berlin; the squares and modern public buildings of Munich, the new town hall at Hamburg, indicate the tendencies of German taste in municipal buildings and embellishments; while in Austria-Hungary the marvelous rebuilding of the central portion of Vienna and the more recent architectural enterprises in Budapest are equaled only by the transformation of Paris under Napoleon III. While the architectural treatment of the Viennese public buildings (the Gothic Town Hall, the classic Parliament-house, the Renaissance University, museums, art institute, the Hoftheater, etc.) leaves something to be desired, the general effect is highly impressive by its stateliness and grandeur of disposition along a single splendid street, the Ringstrasse. In Great Britain nearly every important city has in recent years either rebuilt portions of its more overcrowded districts on improved plans, or erected new town halls, exchanges, public baths, schools, and museums; and the English architects have developed in these public works an architectural style of considerable interest and character, quite different from the modified French Renaissance style which has more generally prevailed elsewhere. Italy, though backward in many respects in this field of architecture, has not only remodeled some of the worst-crowded districts of Naples and Rome, but has embellished many of her cities with public buildings in modern style, established new parks and public gardens, and in some cases completed the unfinished façades of ancient buildings—notably that of the Cathedral of Florence (1883-89). The embanking of the Tiber (1879-1900) in Rome, the construction of new bridges, the building of 'arcades' or glass-roofed streets of monumental design, flanked by attractive shops (as at Milan, Naples, etc.), and the erection of railway termini sometimes of considerable architectural splendor, are further evidences of municipal activity.

UNITED STATES. In the United States municipal architecture has until recent years had little to show worthy of serious consideration. While the first fifty years of independent national existence witnessed the erection of many noteworthy Federal and municipal buildings, especially custom houses and State Capitols, these were, for the most part, indifferently placed, with no adequate approach or surroundings. The public buildings of American cities—town halls, railway stations, schools, courthouses, and administrative offices—were cheap and commonplace, or pretentious and ugly. Only rarely, as at Washington, Savannah, and Charleston, has there been until recent years even the semblance of any recognition of the art of municipal planning, or of the importance of artistic treatment alike in the design and setting of public build-

ings. The rectangular street-plan was universally accepted as the ideal arrangement. Of late, with the general awakening of the art instinct in the United States, stimulated by the object lessons afforded by several great 'expositions' (Chicago, Omaha, Buffalo), there has begun a widespread reform in municipal architecture, of which the new plan for the improvement of Washington, the proposed adoption of the 'group system' for the public buildings of Cleveland, Ohio, the new park system of Boston, and the proposed remodeling of the Chicago lake front, are a few out of many evidences. Recent town halls, exchanges, university buildings (Columbia, New York University, University of Pennsylvania, Washington University, Leland Stanford, Jr., and California universities and others), public libraries, court-houses, and railway stations in the United States are excellent structures architecturally, and give promise that the ugliness of American cities is to be greatly mitigated if not done away with in the near future.

MUNICIPAL ART SOCIETIES. Societies in the United States which take their name from the purpose of their organization, which is the promotion of municipal art, i.e. art as applied to cities. They seek in a general way to beautify cities. Among the means advocated to this end are the planning of cities with regard to artistic beauty, as well as to the needs of traffic; the planting of streets with trees, and the restriction of the billboard nuisance; the increase in the number and size of parks, especially in the congested districts; worthy sites and beautiful architecture for public buildings, and their decoration with statuary and mural painting; the embellishment of the city with statues, monuments, and other works of art—things which have long been esteemed essential in European cities. These ideas are promoted by local societies, like the Municipal Art Societies of New York, Chicago, Baltimore, Cincinnati, etc., the Fairmount Park Association of Philadelphia, and by the American Park and Outdoor Association. Among the achievements of the movement have been the official appointment of Municipal Art Commissions, composed principally of artists, by New York and Chicago, with general supervision over public buildings, monuments, and other artistic undertakings; the enactment of legislation, both State and local, against the billboard nuisance in Chicago; the appointment of commissions of experts to devise comprehensive plans for the growth of Washington (1901) and similar proposals for New York (1903). Two volumes of *Municipal Affairs* are devoted to the movement, vols. ii. and iii. (New York, 1898-99). Consult also C. M. Robinson, *The Improvement of Towns and Cities* (ib., 1900); *Modern Civic Art* (ib., 1902).

MUNICIPAL DEBTS. In a strict sense of the word, debts incurred by municipalities. When, however, the total municipal indebtedness of a country is being discussed, particularly in comparison with State or national debts, the indebtedness of all minor civil divisions is generally included. Municipal debts are divided into bonded or funded, and floating, and the latter may be divided still further into temporary loans in anticipation of revenue and obligations due for material furnished or services rendered. Bonded indebtedness, as a rule, so far exceeds

floating indebtedness that the latter is frequently ignored in ordinary discussions.

HISTORY, OBJECTS, AND METHODS. The development of municipal debt is for the most part coincident with the expansion of municipal functions, an expansion which began with the nineteenth century and was particularly active during the decades between 1850 and 1870. A factor which contributed largely to the growth of American municipal debts was the aid given to railway enterprises. Many municipalities so burdened themselves with debt for the sake of assisting in the construction of railways through their limits, that for many years they were obliged to forego the most essential public improvements. Such railway aid was granted by rural as well as by urban communities.

Railway assistance aside, the chief objects for which urban communities issue bonds are the opening and paving of streets, the construction of water-works, sewers, bridges, schoolhouses and other public buildings, and lighting. Counties, in some sections, issue bonds for bridges and for highway improvements. Finally, school districts, chiefly those located in rural sections, issue bonds to raise money to construct schoolhouses. Obviously, loans in anticipation of taxes, and floating debts, may have their origin in almost any of the various needs of the municipality. Loans in anticipation of revenues are usually raised on notes or tax certificates. Obligations for material and for labor or other personal services, or for amounts due on contracts, are frequently acknowledged by warrants on the general treasury, or on some special fund; and such warrants become negotiable paper. When the cost of specifically local improvements, like paving or sewers, is met by special assessments on the property directly benefited, and the collections are delayed or distributed over a series of years, the obligations are met in a variety of ways, ranging from warrants to short-term bonds. In negotiating municipal loans, bonds are commonly sold, after public advertisement, to the highest bidder. Temporary loans on notes are commonly effected at banks.

The financial principles involved in a consideration of municipal debts are in most respects similar to those already set forth under **DEBT**, **PUBLIC**; and **FINANCE**. Municipal bonds are issued for definite periods and the best and common practice is to provide in advance for their payment at maturity. Formerly such provision was made through sinking funds, but for a number of years past there has been a growing tendency to pay off municipal bonds in installments. This plan obviates the necessity of administering a number of special and rapidly accumulating funds, which sometimes present financial difficulties, and are always subject to diversion on the part of unscrupulous or ill-advised municipal officials.

In fixing the term for which municipal bonds are to run, it should be borne in mind that since municipal bonds are issued to distribute the expense of certain improvements over a number of years, the term of the bonds issued should bear some relation to the probable life of the improvement involved. Street pavements, for instance, require renewal in from ten to twenty years; it would therefore be a gross mistake to make bonds issued to cover their cost run forty or fifty years. Land purchases, on the other hand, in-

volve a class of property that appreciates rather than depreciates as time goes on; it might accordingly be permissible to pay for them by an issue of long-term bonds. Another important factor in fixing the life of bonds is the character of the undertaking to which the proceeds are to be devoted. Water-works, for instance, produce a revenue, and not only may, but should be self-supporting. The means are therefore at hand to pay off the debt, and the sooner this is accomplished the quicker can water rates be reduced or the service improved. Schoolhouses produce no revenue; and this fact affords a reason, but not necessarily a sufficient one, for making the life of the bonds co-terminous with the probable useful life of the structure.

The interest rates on municipal bonds have fallen from 6 and 7 per cent. a few decades ago to $3\frac{1}{2}$ and 4 per cent. as a normal figure for the bonds of municipalities of good standing. The premiums generally received virtually lower the interest rate, often to a considerable extent.

DEBT LIMITATIONS. The interests of borrower and lender combine to make necessary some limit to the amount of indebtedness which a municipality may incur, and the purposes for which money may be borrowed. Considering the latter first, it is obvious that permanent loans should never be made to meet current expenses, although occasionally it may be necessary or wise to fund a floating debt that, through bad financing, has grown beyond ordinary revenues. Public loans to aid private enterprises are generally held to be against public policy, and are unconstitutional in some States. As to the amount of indebtedness which a municipality may incur, prudence demands that this be kept so low as not to overburden the taxpayer with interest and other capital charges, or, in the case of productive undertakings, the patrons thereof. Even where there are no constitutional, statutory, or charter limits on indebtedness and taxation, there is a practical limit to the burden of taxation which the citizen will bear. But most municipalities are subjected to definite limitations as to debt and taxation. Such limits vary widely in different countries and States, and even among the cities of a single State. It is generally some percentage of the assessed valuation, but as the relation of this to the actual value of the property assessed varies widely, comparative debt limits are likely to be very misleading, unless supplemented by explanatory statements. In general, it may be said for the United States that the legal debt limit ranges from 3 to 10 per cent. of the total assessed valuation, although some cities are subject to no legal limitations in this respect. Where the limit is by statute instead of constitution, appeals for its extension or for exemptions on account of certain classes are frequently made to the Legislature. Water-works bonds are quite often exempted from computations of the debt limit, and recently there have been efforts in several States to exclude from the debt limit all bonds issued for revenue-producing works. In Great Britain some classes of loans are subject to the sanction of Parliament, and the control of other classes has been deputed by Parliament to the Local Government Board. This body has a well-organized staff of experts; it gives formal local hearings on applications for specific loans and grants or withholds its consent to the applications. On the Continent

of Europe there is some central control of debts in at least Prussia and France. The nearest approach to central control of loans in the United States is found in Massachusetts, but its exercise is due primarily to sanitary rather than financial safeguards. Legislative permission to make water-supply and sewerage improvements is seldom if ever granted in Massachusetts unless the plans for the proposed work are approved by the State Board of Health.

STATISTICS. Reliable comparative figures of municipal indebtedness are even more difficult to obtain than a comparative summary of debt limitations. The debts of individual cities, especially when reduced to a per capita basis, can be interpreted intelligently only when accompanied by statements regarding tax rates, the extent to which the cost of municipal improvements is met by special assessments, and especially by data as to the character and extent of the services rendered to the citizens by the municipality. Low per capita bonded indebtedness is not necessarily advantageous to citizens and taxpayers, since it may mean that the city in question is either without improvements, or that its water-works, lighting service, bridges, and even sewers, are owned by private companies.

The municipal debts of some of the large European cities in 1888-89 are given by Fairlie* as follows (condensed and rearranged):

CITY	Amount	Per capita
Brussels.....	\$56,000,000	\$280
Paris.....	43,000,000	180
Manchester.....	79,000,000	150
Liverpool.....	43,000,000	90
Amsterdam.....	40,000,000	80
Birmingham.....	60,000,000	86
Glasgow.....	43,000,000	59
Munich.....	25,000,000	55
London.....	243,206,515	54
Leipzig.....	17,500,000	40
Berlin.....	66,219,175	37
Lyons.....	14,000,000	32
Cologne.....	10,000,000	29
Bordeaux.....	6,000,000	24

* Credited by Fairlie to Cadeaux, *Les Finances de Paris*; *Statistisches Jahrbuch der Deutschen Städte*, VIII.; Pahl Dubois, *Essai sur les Finances Communales*.

According to the English Local Government Board reports, the local debts of England and Wales increased from £92,820,100 in 1874-75 to £252,135,574 in 1896-97, whereas in the same period the debt of the United Kingdom decreased

from £768,945,757 to £640,773,697. In other words, the local debt increased in twenty-two years from 12.07 to 39.35 per cent. of the national debt. Fairlie (see bibliography) states that in England the municipal debt trebled from 1875 to 1898, and that in France it increased by two-thirds between 1868 and 1899.

For the United States local debt statistics by cities, States, and for the whole country were given in the Tenth and Eleventh Censuses (1880 and 1890). Beginning with 1899, the United States Department of Labor has devoted a large part of its September Bulletin, each year, to "Statistics of Cities," among which it includes bonded, floating, total, net, and per capita net debts, sinking funds, and legal borrowing limits for cities of 30,000 population and upward. The bulletin for 1902 contained figures for the fiscal year preceding (1900-01, 1901, and 1901-02, according to local conditions) for 137 cities. The per capita net debts (figured on estimated populations) range from \$1.48 for San Francisco to \$115.57 for Newton, Mass. The average is not given. In connection with the low debt of San Francisco, it should be noted that the water-works and lighting plants are owned by a private company, and that in many respects the city is backward in public improvements. Newton, on the other hand, is a very progressive city. Selecting the largest city in each group of ten, the table following has been compiled from the 1902 bulletin.

Of the 137 cities in the original list, 23 report no sinking fund, and an equal number report no debt limit. Providence, R. I., is allowed to contract debts up to 30 per cent. of its assessed valuation and sinking fund combined, and Norfolk, Va., may go as high as 20 per cent. of the assessed valuation. The lowest limit is 2½ per cent. of the assessed valuation.

* Of assessed valuation; excluding water debt. † Of assessed valuation. ‡ Including \$856,209 assessment bonds. § Controlled by State legislature. ¶ Of average assessed valuation for three years. ¶ Of assessed valuation; may be 7 per cent. by vote of people, for general city purposes, also an equal amount for school purposes.

MUNICIPAL GOVERNMENT. The administration of the affairs of a city, town, borough, village, or other minor civil division of a State, but generally restricted to the government of pure municipal corporations as opposed to *quasi* municipal corporations, such as counties, townships, and school districts. Municipal government seldom reaches its fullest development outside of the larger cities, but numerous municipal activities are often undertaken in progressive urban communities of only a few thousand inhabitants. Since the municipality is the creature of the State, it follows that its form of government, its various activities, and its powers are not only derived from the State, but are also subject to alteration or repeal at its will. The municipality has a direct and far more intimate relation with those subject to its government than does the State, supplying many wants common to its inhabitants, and performing or supervising the performance of many services which outside of the municipality are left to private enterprise.

In some of these respects, as in the exercise of the police power, the care of the public health, the administration of charity, and the administration of local justice, the municipality is actually the agent of the State, and discharges duties of interest to the State at large; in others, as in the furnishing of water or light, the State permits the community as a whole to act as a local organization for the satisfaction of purely local needs of interest to the community only. The very remarkable growth of the urban population during the last half century has greatly increased the importance of municipal government, and at the same time multiplied its difficulties. About three-fourths of the population of England and Scotland now live under conditions of urban life, while in the older parts of the United States the town dwellers outnumber the country dwellers. For the origin and nature of the legal powers of municipalities, see **MUNICIPALITY**; see also the general article **GOVERNMENT**. For the history, growth in population, and certain economic, social, and political phases, see **CITY**.

Municipal government may be considered under four main heads: (1) Functions; (2) organization; (3) finance; (4) public policy.

MUNICIPAL FUNCTIONS. The functions of a municipality include all the public activities of the city, whether direct, such as laying out and maintaining streets, or indirect, such as regulating traffic and maintaining order on the public thoroughfares. These activities are many and complex, and frequently overlap, but they may be grouped as follows: (1) The so-called public utilities, which include ways and means of communication and transportation, together with the supply of light and water to the inhabitants; (2) disposal of wastes; (3) protection of life, health, and property; (4) charities and correction; (5) education; (6) recreation; (7) municipal housing. The provision of *ways and means of communication and transportation* is one of the first and most obvious functions of municipal government. Its basis is the public streets, upon the surface of which all land traffic moves, beneath which are placed pipes to bring in municipal supplies and to carry out wastes, and either above or below which are wires for transmitting messages. As an aid to the movement of

street traffic, it falls within the duties of the municipal government either to provide street railways or to see that they are provided and properly operated by private enterprise. In many of the English and Scotch cities the street railways have been constructed and are owned by the municipality itself, although it is a common practice to lease them to a private company for operation. In the United States this is usually a function of private enterprise, subject to the supervision of the city. Where waterways are involved, bridges and perhaps ferries must be provided, and frequently docks, wharves, and harbors as well. Bridges are now almost always built at public expense, and are as free to all as the streets, but sometimes bridges are owned by private companies, and sometimes, but rarely in large municipalities, toll is charged for the use of the bridges. The construction and control of harbors is not a municipal function in the United States, and in other countries their care is generally a function of the national government. Municipal docks are far more common than municipal harbors. Where docks are required, they often are or may be an important source of revenue; but the first consideration should be to afford every facility for the speedy and cheap handling of goods and passengers. The relation of municipal government to the telephone and telegraph service is chiefly regulative, especially in the United States, and thus far extends but little beyond the police control of the electric wires involved.

One of the most important municipal services is the supply of water for household and industrial purposes, for fire protection, and for sewer and street flushing. The lighting service, like the water supply, is both for public and private use. The light furnished may be either in the form of gas or electricity. Almost everywhere at present the water and lighting supplies are municipal functions, although they may be intrusted to private companies. Municipal markets for the sale of meat and other food supplies are frequently maintained for the sake of both convenience and sanitation. The sanitary aspects of cattle markets, abattoirs, and slaughter houses are of great importance. Consequently, where markets are not provided, the municipal health authorities exercise, or should exercise, a rigid supervision over private markets, and also over the various foods prepared or exposed for sale therein. The supply of such articles as milk and ice to the inhabitants is left to private enterprise, but on sanitary grounds is usually subject to regulation by the municipal government.

WASTES. By far the greater part of the large quantity of water supplied to the modern municipality must be removed again in a more or less befouled condition. All American, many British, and the largest Continental cities have found water to be the best vehicle for removing excreta, and as a result we have the modern sewerage system, which carries away this dangerous waste together with the water otherwise befouled by domestic use. The surface drainage from roofs, yards, and streets may be removed with the sewage, or else in separate conduits. The food wastes of the kitchen and table, consisting of decomposable organic matter, and commonly known as garbage, require separate disposal; and the same is

true of ashes, waste paper, and other rubbish. Street dirt must be collected and removed, and the streets must be sprinkled to keep down the dust which is inevitable even with the best sweeping. All these are municipal functions which cannot be left to private enterprise. Finally, the human dead must be considered under the general head of wastes, and cemeteries must be provided for burying or crematories for burning the bodies. Cemeteries are frequently, but crematories rarely, owned by municipalities. The other services included under the heading, in so far as they are performed with regularity and system, are almost invariably rendered by the municipality, either directly or by contractors at its expense and under its supervision.

PROTECTION OF LIFE, HEALTH, AND PROPERTY. The protective functions of a municipal character include the work of the police, the courts, the fire department, and the board of health, together with the building inspection service, and the provision of public baths, wash houses, and water closets. *The charities and correction service* includes poor relief and the maintenance of asylums and reformatories. *The educational service* embraces not only the work of the common schools preparatory to the college, but manual training, and sometimes technical education, night schools, vacation schools, libraries, and museums. The municipality in undertaking the work of elementary education and poor relief is acting as the agent of the State, and is subject to more or less central control so far as these activities are concerned. *The recreation service* includes the establishment and maintenance of parks, playgrounds, gymnasiums, together with the provision for public concerts and lectures. The three first named institutions might also be included under both education and health service, while concerts and lectures may be included under education as well as recreation. *Municipal housing* is practically unknown in America, but is a marked feature of municipal activity in Great Britain. It has arisen partly through the demolition of whole blocks of unsanitary houses, which seemed to make necessary a provision for rehousing the ejected tenants, and partly from a desire to afford municipal aid in the efforts being made by philanthropists to improve the home condition of the working classes. The houses built at municipal expense are generally designed to provide living places thoroughly sanitary in their construction and appointments for the poorest class of self-supporting wage-earners.

ORGANIZATION. The successful administration of the many and varied activities just outlined demands a degree and character of organization resembling in some respects that of a large private corporation. In the government of States it is common to divide the functions of government as well as the officials who discharge them into three groups—the legislative, the executive, and the judicial. The same general plan might be followed in considering municipal government, but separation into these three branches is by no means so easy, on account of the greater overlapping of municipal functions. The judicial power, except as it is exercised by municipal mayors, is more a State than a municipal function, and will not be further considered, except to note the existence of municipal police courts for the prompt trial of

persons arrested for misdemeanors or crimes. The legislative functions of municipal governments are exercised primarily by the council, and the executive, by various officers and boards, with the mayor as the chief executive officer. Some of the executive boards possess quasi-legislative powers, while others, such as boards of health, exercise both legislative and judicial functions. The mayor's duties are legislative, judicial, and executive. He often presides over the meetings of the council, casts the deciding vote in case of a tie, usually has the power to veto ordinances, appoints officials, supervises the affairs of the city, hears and passes upon charges involving possible dismissal of officials, and sometimes acts as a judge of municipal courts. In the United States the mayor is elected by popular vote, though formerly he was quite generally elected by the council; elsewhere he is commonly appointed either by the city council or by the central government. (See MAYOR.) In extent of power the mayors of the United States rank first, and there is a strong tendency to increase their powers and responsibilities. In point of training the mayors of Germany take the lead; in that country the mayoralty is a profession, and a successful officer is promoted from one city to another and larger as his ability and reputation increase. In all countries the mayor is the chief representative of the city, but in Great Britain alone the office is mainly one of dignity and honor. In that country the mayor is a member of the council and presides over its meetings, but he does not possess the veto power. The importance of the mayor's office in the United States is largely due to the control which he exercises over legislation through his power of veto, and to his power of appointing and removing executive officers. The latter power is generally subject to approval by the council, but it is in freedom from this restriction that the growing importance of the office chiefly consists. The extension of the power of appointment is significant because it diminishes the number of officials elected by popular vote, as well as the number chosen by the council, and combined with the power of removal, which is coming to be generally granted, enables the mayor to shape municipal policy and to direct the manner in which that policy is carried out. The later municipal charters quite generally grant the mayor the power to appoint the various heads of departments, except the chief financial officer, who is usually elected by popular vote. Aside from the exercise of judicial power involved in the removal of officials for cause, mayors do not usually act as judges except in the United States and Great Britain, and in these countries their judicial functions are chiefly in the capacity of justices of the peace. In the larger cities of the United States this function is seldom exercised by the mayor, and in some sections it is entirely lacking; but it may still be found in force in Delaware, in the Southern States, Indiana, Iowa, and elsewhere. See MAYOR.

THE COUNCIL. The powers and duties of the city council vary greatly in the different countries of the world, and quite as much so in the several commonwealths of the United States, or even in the cities of a single State. Germany leads in the comprehensive control of its councils over municipal affairs, and Great Britain ranks next in this particular. The German coun-

cils control schools and charities, which in Great Britain are under two sets of quite independent authorities, but while the German councils are in some respects subject to the board of magistrates, including the head magistrate, the burgo-master or mayor, and while the latter has other important functions, the English council has full local control within its sphere. The French municipal councils, unlike those of Germany and Great Britain, have few or no administrative powers, their control being limited chiefly to the appropriation of money and questions of policy. In the United States the councils formerly closely resembled those of Great Britain, and frequently had control of charities and of other municipal activities, but one by one many of their powers have been taken from them and bestowed on the mayor or else on independent boards. Among these boards may be mentioned water, sewerage, street, park, fire, police, and health boards, or combinations of two or more of these into a single board. Again, single-headed departments, more or less independent of the council, have been created by municipal charters or by special legislation. The financial control of some of these new bodies, has been left with the city council, at least to the extent of making or withholding appropriations, and borrowing money by means of bond issues. In Great Britain and the United States the councils are restricted to the exercise of those powers specifically or impliedly authorized by the State, and implied powers are seldom so construed as to warrant permanent loans, purchase of land, erection of buildings, or other public works. On the Continent of Europe grants of municipal authority are far more general and limitations specific, but the central government exercises a general control and supervision over the municipalities unknown in the United States, and rarely if ever practiced in Great Britain. In the latter country, however, the Local Government Board, in sanitary matters, and the Board of Trade, in the case of municipal enterprises which produce revenues, pass upon loans, and by their power of granting or refusing authority for these they exercise no little control over municipal councils. The council in the United States, particularly in small cities, is generally a single-chambered body, elected by districts, but there are numerous instances of a select council, or Upper House, the members of which are frequently elected by a larger constituency than those of the Lower House, or by the city as a whole, and sometimes serving for a longer term. In England the council sits as one body, but it is composed of councilors elected by the people and of aldermen chosen by the council, usually from its own membership. (See GREAT BRITAIN.) In Continental Europe there usually is but one chamber of councilors, and frequently the members are elected on a general ticket. As a rule, the councils in European countries are far larger than those in the United States, containing from 50 to 150 members, and in one case, Budapest, 400 members. In the United States, even where two chambers exist, there are rarely over 50 to 60 members, but Philadelphia is a notable exception, with nearly 200 members in both branches. The tenure of municipal councilors is from one to four years in the United States; three years for councilors and six years for aldermen in Great Britain; four years in France and Spain; five years in Italy; six years in

Austria, Prussia, Hungary, Holland, Belgium; and nine years in Bavaria. In most of the European countries provision is made for periodic renewal of the council. The usual rule is renewal by thirds or halves, annually, biennially, or triennially, according to the length of the term. The most universal legal qualification for councilmen, aside from age, is residence. In America councilmen must not only reside in the city which they represent, but, by written or unwritten law, within the district which elects them. In France any taxpayer is eligible, even though not a voter, provided the number of non-resident councilmen does not exceed one-fourth the whole. In England taxpayers residing within fifteen miles of the municipality may be elected for any district thereof. Property qualifications for a portion of the members of the council are required in European countries, but in a few cities, including Dresden and Leipzig, half of the membership must be from non-property-holders. In the United States property qualifications for membership in the council were formerly quite common, but are no longer required. In all countries the work of councils is largely done by committees, and this is particularly true of those countries where the council has large powers and duties, which doubtless accounts for the large bodies in Great Britain and elsewhere in Europe. In Chicago and in most small cities the presiding officer of the council is the mayor. In other large American cities there is usually a president of the council elected by the city at large. In Europe the council usually elects its own presiding officer. Generally speaking, members of municipal councils receive no salary and frequently service is compulsory. In a number of the large cities of the United States, however, members receive pay ranging from a small per diem allowance to \$2000 a year, which is the amount paid to members of the New York Council.

EXECUTIVE BOARDS AND OFFICERS. These range from the mayor and council committees to the more or less independent boards and commissions so common in the United States, and on down to minor officials acting under these officers. The number and variety of services which these boards and officials perform has been partly indicated in the enumeration of the city's functions. In cities where the council is supreme, the committees of that body exercise large executive powers. Great reliance, however, is placed on trained executive officers selected by such committees or by the council as a whole for the various departments of municipal activity. Outside of the United States such officials are seldom chosen by popular vote, but in this country it is not uncommon to choose many of these officers by popular election. Minor positions are, of course, filled by the board concerned or by the chief executive officer responsible for the work undertaken by the appointee, rather than by popular election or by the council. The town clerk is the most important official in an English municipal corporation. Besides his duties as recording officer of the council and general secretary of the municipality, he acts as legal adviser of the council and as custodian of records. His tenure of office is frequently for life, he receives a high salary, and he is a trained official much as is the mayor of a German city. The city clerk in the United States is never an officer of such training and importance. Generally he is simply a record-

ing officer to the council, or perhaps a kind of mayor's assistant. Legal advice to the municipal authorities in the United States is given by an officer styled the corporation counsel, and suits are prosecuted and defended by a city attorney, although the two classes of service may be rendered by one man, and the names vary in different localities. The city engineer is everywhere a trained man, and municipal engineering has become a distinct branch of the engineering profession. In the large cities the legal and engineering work is so extensive and important as to require large staffs of experts. This is also the case in the financial department, using the latter term to embrace all the executive officers employed in assessing, collecting, and disbursing money, and in maintaining a check on collections and disbursements.

FINANCE. Under this head *Ordinary Revenues* include the proceeds of taxes, special assessments for benefits, like the frontage tax for street paving, and various licenses and fees. *Extraordinary Revenue* includes money from loans, bond issues, and trust funds or bequests. Some cities of Continental Europe receive no little revenue from landed property, and the cities of Great Britain and Germany, and a few in the United States, derive considerable revenue from municipal franchises. Where municipal ownership prevails in British cities effort is often made to turn into the common treasury a revenue for the reduction of the general tax rate. In the United States a portion of the revenue from water-works, and less frequently from municipal industries, is sometimes applied in a similar manner. The taxing power is generally limited to the council, the chief exceptions being the education and poor authorities in Great Britain, which have an independent power of taxation. In the United States the councils often have to raise large sums by taxation for independent boards, and also for the county and for the State. It is common for the independent boards to incur bonded indebtedness without consulting the council, but only as the authority, in general or specific terms, is granted by the State Legislature. The sub-departments under the general head of finance are tax assessors, who place a valuation on taxable property; a board of review or appeals from the rulings of the last-named officers; tax collectors; the treasurer, who receives money from the collectors; the disbursing officer or controller, who issues or approves warrants for the payment of bills and claims; and the auditing department. In some cities, particularly the smaller ones, the treasurer is also the disbursing officer, and the council instead of a controller may approve claims. The *municipal budget*, or the estimate of receipts and expenditures upon which the tax rate and appropriations are based, is prepared according to various methods. In general, the several departments make up their respective estimates, and these are amended by the mayor, or by a special board created for that purpose, and sent to the council for further amendment and final ratification.

CITY CHARTERS. The municipality being a mere creature of the State, its area, powers, and form of government are laid down by the Legislature in the form of (1) a specific act or charter; (2) a given act for cities of a given class; or (3) a series of either general acts relating to groups of cities or to all municipal corporations;

or (4) special legislation on any subject and at any time that suits the wishes of the Legislature. Strictly speaking, the first only is a city charter, but the other grants of power have the same general effect, except that 3 and 4 are successively more confusing and less satisfactory than 1 and 2. In the United States city charters may or may not be, as the Legislature sees fit, submitted to popular vote for approval. Frequently both charters and charter amendments are so submitted, and where general municipal corporation acts prevail the transition from one class to another is generally by popular vote, but it may follow from an increase in population. As a rule, voters of a municipality have some voice or influence in framing new or amending old charters, except perhaps where general legislation prevails. This participation goes so far in some cases as to permit the framing of the designed changes by an authorized charter commission or to the adoption of changes requested by the municipal officials. In Missouri, California, and Washington, charter-making is virtually under the control of the municipality, subject to more or less specific legislative restrictions. Far more commonly, the respective legislatures pass enabling acts, which may or may not be in the nature of charter amendments, and leave their adoption to the popular vote.

OTHER MUNICIPAL PROBLEMS. A comprehensive term used in discussions of municipal affairs is *Municipal Reform*. This is nothing more or less than an effort to secure honest and efficient municipal government. The problem varies with each locality, and even changes in a given locality from year to year. The bane of municipal government is partisan politics. The remedy for bad municipal government, from whatever cause, invariably lies with the citizens and taxpayers, who are often too indifferent to their own interests, or at least to the public interest, to insist on good government. A decided reform in municipal affairs was effected in Scotland in 1833, and in England and Wales in 1835, as a result of agitation directed against incompetent and corrupt borough government. The reform acts of the year named were supplemented from time to time, and in 1882 a consolidated municipal corporations act was passed. In 1888 another act was passed, providing that cities and towns of more than 50,000 inhabitants should be administrative counties, and also creating a more unified government for Greater London, known as the London County Council. In 1900 this unification was carried still further, but only to the extent of reducing by consolidation into some fifteen borough governments a large number of minor authorities. In the United States the progress of municipal reform, as reflected by changed methods of administration, is difficult to trace. This is largely due to the many independent State legislatures controlling municipal affairs, to the great variations of practice within each State, and to the spasmodic efforts for reform. One of the notable steps in many States has been the adoption of constitutional amendments, from 1850 to 1880, prohibiting special acts of the Legislature which apply to a single municipality. Other great agencies of municipal reform in the United States have been the various local reform organizations, notable among which have been the good government clubs, and their federation into the National Municipal League.

(See subhead *Charters*, above.) Other organizations whose annual proceedings are noted below (see *Bibliography*) have played an important part in municipal reform.

The need for *Municipal Specialists* becomes more and more imperative as the municipal activities increase in number and complexity. Mayors in Germany, city clerks in England, and city engineers in all countries are already a distinct professional class, stimulated by the prospect of advancement to more important cities as their abilities increase. Sanitary or health officers, professional accountants, superintendents of water supply and other public works are also rapidly gaining in professional ability, and public recognition of such ability is likewise increasing.

MUNICIPALITY, or MUNICIPAL CORPORATION. A town or city possessed of certain privileges of local self-government; also the governing body in such a town. Municipal institutions date back to the Roman Empire. The provincial towns of Italy, though subjected to the rule of a Roman official, were allowed to enjoy the right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the Imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the Roman governor. The municipal system declined with the decline of the Empire, yet it retained a fair degree of vitality, and rose to renewed life in union with feudalism, and with the Anglo-Saxon institutions of Great Britain. Indeed, some cities of Italy, France, and Germany have derived their present magistracy by direct succession from the days of Imperial Rome, as is notably the case with Cologne. The bishop, as the shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In Southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government. Of the cities of the Middle Ages, some were entirely free. Venice, Genoa, Florence, Hamburg, and Lübeck all stood in this position. Next in dignity were the free Imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the Empire. Most of these cities rose to importance in the thirteenth century, and their liberties and privileges were fostered by the Holy Roman emperors to afford some counterpoise to the growing powers of the immediate nobility. The chief organs of government in the German cities were the councils, usually one for deliberation and a smaller one for administration, both being chosen from the various trade and artisan guilds. There were also from two to four burgo-masters in each city who presided over the council meetings. The Italian cities were governed by executive officers known as consuls, usually twelve in number. By the side of these were a council and a general assembly of the citizens. During the contest between the Italian cities and the Emperor an officer, called the *podestà*, was put in control of the cities which the Emperor succeeded in subjecting to his authority. Other cities, seeing the advantage of a single executive, voluntarily introduced this officer in place of the consuls. In Southern France the Italian consular system existed, but occasionally the *podestà* appears as the chief municipal officer. In the northern part of France the *maire* and *échevins* were most frequently the governing authorities of the towns.

Before the Norman Conquest the English

burghs were subject to the rule of an elective officer called the 'portreve,' who exercised in the burghs functions similar to those of the shire-reve in the shire. The Normans recognized the already existing privileges of the towns by granting them charters. One of the most important of these privileges was the *firma burgi*, or lease of the town to the inhabitants in consideration of the payment of a fixed sum in lieu of all feudal dues. This involved the right of the inhabitants to elect their own magistrates, the independent exercise of jurisdiction in their payment of the local taxes, and the performance of the quota of taxes assigned by Parliament. A sheriff or viscount was placed by the King over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns the bailiff was allowed to assume the Norman appellation of mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes and the performance of local duties. Titles to freedom of the town were also recognized on the grounds of birth, apprenticeship, marriage, and sometimes free gift. In all the larger towns the trading population came to be divided into guilds or trading companies, through membership of which admission was obtained to the municipal franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and it gradually became the practice for these functionaries to perpetuate their authority by cooptation. Contentions and disputes arose regarding the right of election, and eventually the Crown threw the weight of its influence into the scale of self-elective ruling bodies. This was the period of incorporation, when charters were granted incorporating not the inhabitants of the town, but the governing body. No new governmental powers were conferred, but the corporations were given the right to hold property and to sue and be sued. The desire of the Crown to control the representatives which the towns were now allowed to send to Parliament led to a reckless policy of granting municipal charters, so that presently the urban communities were over-represented in Parliament. During the period of the early Stuarts the writ of *Quo Warranto* was used frequently to deprive the towns of their liberal charters, with a view to replacing them with charters of a less liberal type, in order that the Crown might the more easily control the Parliamentary representation of the towns. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the fourteenth and fifteenth centuries the municipal suffrage fell more and more into the hands of restricted bodies of men until an act of 1469 gave to the councils the right of appointing their successors, the old and new council together electing the office-bearers of the corporation. This state of things continued till 1833, not without much complaint. In the Scottish burghs the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for Parliamentary reform arose

an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the kingdom.

In the United States the English system of municipal administration became the type for the government of the early towns and cities. In nearly every instance a special organization was provided for the cities and was outlined in a charter granted by the colonial legislature or by the Crown. Generally the governing body of the municipality consisted of the mayor, recorder, aldermen, and councilmen. At first the corporation seldom acted as the agent of the State, but was an organ for the satisfaction of purely local needs, such as the management of local property and finance. It had no power of government except the right to issue local police ordinances. Gradually, however, the municipal corporation came to be an organ for the administration of matters of State concern, as well as of purely local matters. Thus the regulation of matters relating to public education, the public health, poor relief, elections, local justice, etc., is quite generally intrusted to the municipalities. As now understood, therefore, a municipal corporation in the United States is a body politic and corporate created by the State for the purpose of State administration as well as of local administration, and vested with certain privileges, such as the right to hold property, to sue and be sued, etc. The transformation of the municipality from an organ of local government to an organ for the administration of central matters created the necessity for legislative control, which has had the result of depriving the cities to a very large extent of the management of their local affairs. The corporation is not the body of the people, nor is it the officers collectively considered, but rather that artificial body or legal entity created by the act of incorporation and limited thereby. A distinction must be made between a municipal corporation proper and what are known as *quasi* corporations not created upon petition of the people of the district, but rather as territorial or political divisions of the State, such as counties, townships, and school districts created for the convenience of State administration. The laws regulating the incorporation of English towns and cities have little application to municipal corporations in this country. Here none are founded on common law or royal charter, and but few are based upon prescription. It may be said that they exist only by legislative enactment, and possess no powers not created by statute. A few municipal corporations are created by charter singly, but general laws of incorporation have been passed in many States, and at the present time the constitutions of more than twenty States forbid the Legislature to incorporate cities and, as a rule, villages by special act. In twelve of these the prohibition extends also to amendments or changes of charters. When the incorporation is single or special the charter sets out that the inhabitants are constituted a body politic with such a name and style; that by that name they may have perpetual succession, and may use a common seal, sue and be sued, etc. The territorial boundaries are defined and provision made as to the form of government—usually by a council made up of aldermen and councilmen, or by trustees—as to division into wards, qualifications of voters, powers of city council to collect

debts and impose taxes, etc. General laws of municipal incorporation usually start by abolishing all special charters existing and establishing general regulations for the incorporation, government, and regulation of municipal corporations throughout the State. Frequently such laws classify the towns to be incorporated as regards their importance into cities of first or second grade, towns, and villages. To become operative, the charter granted by the Legislature must be accepted by the body of citizens to be incorporated.

When established the municipal corporation is, in the absence of constitutional provisions to the contrary, completely subject to the power of the Legislature; thus it has been held that the latter may repeal charter provisions, allowing the licensing of liquor dealers, and even such as relate to police regulations. In other words, a municipal charter is not a contract, and may always be altered or revoked, with the important exception that the rights of existing creditors must not be disregarded. The Legislature has general control over public property; thus it may authorize a railroad to occupy streets of a city without its consent and without payment therefor. But the courts are beginning to hold that the municipalities may also own private property which is not directly devoted to governmental purposes, and which is no more subject to control of the Legislature than the property of private individuals. Such are wharves, cemeteries, ferries, libraries, parks, hospitals, etc. The Legislature cannot deprive the municipality of property of this kind, or direct that it shall be applied to other purposes, as, for example, that land used for a city reservoir shall be converted into a public park. The power of the municipality to alienate its public property without legislative authorization has generally been denied by the courts, although the right to dispose of private property as it sees fit has been readily conceded. It is also a general rule that the public property of a municipal corporation is not subject to execution in satisfaction of a judgment. No exact form of words is necessary to give force to the charter, and the corporation may even be created by implication, as where powers and privileges are conferred upon the inhabitants of a locality which cannot be enjoyed or exercised without acting in a corporate capacity.

The powers which may be exercised by a municipality are such as are expressly granted in the charter, such as may be fairly implied therefrom, and such as are essential to the declared objects and purposes of the corporation—not simply convenient, but indispensable. Any fair or reasonable doubt concerning the existence of a power claimed is resolved by the courts against the corporation. That is to say, the rule of strict construction applies. In some of the recent decisions, however, there is evidence of a tendency to depart somewhat from this rule in the direction of conceding to municipal corporations wider powers, especially as regards the management of public utilities. Thus it has been held that a municipality which has the right to establish an electric light plant for lighting the streets may without an express grant from the Legislature distribute lights to private families. Where the city is given discretionary power upon any subject it is not for the courts to say

whether such discretion has been wisely used or not, unless fraud is shown or the discretion is being manifestly abused to the oppression of the citizen. Thus, if it have power to open new streets or grade old ones when necessary for the welfare of the city, the question of necessity is one for the determination of its own authorities. But when a municipal corporation is empowered to take certain action for others, and it is beneficial for them to have it done, the law requires that it should be done, although the language is merely permissive in form. Among the principal powers usually conferred upon municipal corporations may be mentioned the right to acquire and hold such property as may be necessary to the proper exercise of other powers granted, the right of taxation and of eminent domain, the appointment or election of officers, the maintenance of local courts, the enactment of ordinances, and the maintenance of actions in the courts. Many special powers are given, such as relate to the incurring of loans, special assessments, licenses, police regulations, wharves, ferries, entertainment of guests, etc. It is a general rule of construction that the legislative power conferred upon municipal corporations cannot be delegated to other authorities, nor can they divest themselves of it in any manner whatever. The power to act for the general welfare of the city is usually granted, in addition to other powers expressly enumerated. Under this grant it is generally held that municipal corporations may pass such ordinances not inconsistent with other provisions of the charter or the laws of the State as may be expedient in maintaining the peace, good order, safety, and welfare of the community. Thus they may enact ordinances to provide for a proper observance of the Sabbath, for the closing of saloons at night, for restraining domestic animals from running at large on the streets, for the suppression of vagrancy, for the prevention of cruelty to animals, etc. But the 'general welfare' grant does not authorize the municipality to levy taxes of any kind. As a result of their contractual powers, however, municipalities may incur debts, provided they are to be paid out of the ordinary income of the city for the current year. The better opinion seems to be that in the absence of a specific grant municipalities may borrow money where it is necessary to the successful existence of the corporation, or where its non-exercise would render inoperative and incomplete privileges granted. Where the Legislature imposes a duty on municipal corporations which necessarily involves large expenditures the power to borrow may be deduced. It has been held that where the city had express power to establish meat markets, a fire department, or a liquor dispensary, the power to borrow could be implied as a necessary means for carrying out these undertakings. It may be laid down as a rule, however, that municipal corporations have no general borrowing power or power to issue negotiable paper in evidence of debts without legislative authorization. The constitutions of many States contain provisions limiting the amount of indebtedness which municipal corporations may incur. The prohibition is usually construed to apply to indebtedness of all forms. It is, however, held by some courts that contracts for meeting the ordinary expenses of the municipality and in anticipation of receipts do not create an indebtedness

within the meaning of the limitation. A municipality cannot escape liability for its obligation arising *ex delicto* by pleading that its indebtedness has reached the constitutional limit. Those who contract with a municipality whereby its indebtedness is increased do so at their own risk. If, therefore, an individual lends money to a city which has no legal power to borrow he cannot recover it by pleading ignorance of the powers of the city. But where municipal bonds contain recitals that the city is acting within its constitutional power, and has complied with all the requirements of the law, it will be estopped from disputing the truth of such representations as against a bona fide purchaser of the bonds.

The legislature has no power to enact legislation which will have the effect of impairing the obligation of a contract between the city and a private party. Thus it cannot so limit the taxing power of a municipality as to render it impossible for the city to meet its ordinary expenses and pay interest on its outstanding bonds. On the other hand, the legislature has no power to authorize a municipality to levy taxes for other than public purposes. Thus it cannot authorize the granting of aid by a municipality (if it involves taxation) to a private enterprise to enable it to begin business, since that would amount to taking private property without compensation. Among the public purposes for which a municipality may levy taxes may be mentioned the construction of sewers, the laying out of parks, the establishment of water-works, etc. Moreover, the legislature cannot levy a special tax upon the inhabitants of a municipality for other than strictly municipal purposes. Thus it cannot require them to defray the expenses of improving a navigable stream or to take stock in a railway company, although they may be required to build a local canal or levee. The city may be compelled by mandamus to fulfill its obligations to private parties, as where it refuses to levy a tax for the purpose of paying interest on its outstanding bonds or for the satisfaction of judgments against it. The city may be enjoined from doing an injurious act to an individual or from committing trespass upon his premises. Furthermore, it may be enjoined at the instance of a taxpayer from violating the law or doing other acts prejudicial to the general welfare, as where the city proposes to enter into a contract which will create an indebtedness in excess of the constitutional limits. Municipal officers may also be proceeded against under a writ of *quo warranto* for usurping powers not legally conferred upon them. In the United States the practice of frequent interference in the affairs of the cities by the legislature has led to so many abuses that in most of the recent constitutions provisions have been inserted prohibiting the legislatures from passing special acts which apply to a particular city when a general law can be made applicable. These provisions, however, have frequently been evaded by arranging the cities into classes in such manner that a particular city will constitute a class by itself and by making the act applicable to a single class. The practical difficulties of dispensing entirely with special legislation has led the courts in some instances to sustain the constitutionality of methods of classification which seem unreasonable if not ludicrous. Where a part of a municipality is detached from the main body of

the city the old corporation retains all the liabilities and private property of the city if no provision to the contrary is made by legislation. Property of a public character falling within the limits of the new corporation passes into its control, the theory being that there has been no transfer of title, but simply a change of trustee. A new municipal corporation, embracing substantially the same boundaries as the old, is regarded in law as the successor of the old, entitled to all its property rights and subject to its liabilities. Upon the repeal of the charter of a municipal corporation a court of equity will lay hold of its private property and administer it for the benefit of the creditors of the corporation. It is a general rule of construction that if the existence of a municipal corporation is not questioned by the State it cannot be put in issue by a private individual in a collateral proceeding.

In discussing the liability of municipal corporations for torts it is necessary to distinguish between the two classes of powers which they exercise, viz. public governmental functions on the one hand and private corporate functions on the other. When acting in the former capacity municipal corporations are acting as the agent of the State and are governed by the rules of public law, one of which is the irresponsibility of the government for the tortious acts of its agents. When acting in a private local capacity, primarily for the advantage and benefit of the locality, the municipal corporation is subject to the rules of the private law, according to which it is held liable for the torts of its officers. The rule of liability for torts does not apply to *quasi* corporations, such as counties, townships, school districts, etc., because they are agencies of the State created for the purpose of State administration, and usually without solicitation or concurrence of action of the inhabitants. The principal torts which are imputable to municipal corporations when acting in the latter capacity are negligence, non-compliance with the statutes, nuisance, and trespass. The courts have generally held that municipal corporations are not liable for failure to exercise discretionary legislative power which may be conferred by the legislature or for the manner in which they may exercise it if done in good faith. Thus, it is not liable for its neglect to abate a nuisance, as where an individual was injured by an explosion of fireworks which the municipality was authorized to prohibit. But where the duty is ministerial and absolute the corporation becomes liable for the injury arising because of failure to perform it, and where it positively licenses something which constitutes a nuisance it will be held liable for any injuries that may result therefrom. In the exercise of a discretionary power, as in the construction of a sewer, the city will not be held liable for injuries resulting from defective service unless it results in the positive invasion of an individual's property and unless it can be shown affirmatively that the municipality has been guilty of negligence. It is a general rule that a municipal corporation is not liable for injuries arising from neglect or failure to enforce strictly its ordinances for the good government of the city, but an act of the Legislature making the city liable for property destroyed by mobs has been held to be constitutional. In the exercise of its police powers the city is not generally liable for the acts of omission of its agents, as

where a policeman shoots a bystander while attempting to kill a dog running at large. The same is true of negligence on the part of the fire department and of the health department. In all these cases the municipality is acting in its public governmental capacity as an agency of the State. In the management, however, of institutions not directly connected with the function of government, such as wharves, gas and water works, markets, and wash-houses, municipal corporations are held liable for injuries that may result therefrom, the theory being that in this capacity the corporation is engaged in private business, from which often a revenue is derived. It is also a general rule that municipal corporations are responsible for the management of streets. The rule, however, does not apply to *quasi* corporations in the management of public highways. This is due to the fact that, unlike pure municipal corporations, they are engaged chiefly in the performance of public governmental duties from which they do not generally derive any revenue or particular private advantage. The peculiar rule exists in New England that the property of any citizen of a municipality against which a judgment has been recovered may be seized in execution thereof. Elsewhere the remedy is execution upon the private property of the municipality. Consult: Dillon, *The Law of Municipal Corporations* (Boston, 1890); Jones, *The Negligence of Municipal Corporations* (New York, 1892); Goodnow, *Comparative Administrative Law* (New York, 1893); id., *Municipal Home Rule* (New York, 1897).

MUNICIPAL LAW. To the Romans, municipal law meant the special law of the cities, other than Rome, which were included in the Roman Empire. A *lex municipalis* was a city charter, granting limited self-government in matters of local interest. On the Continent, toward the close of the Middle Ages, the phrase was sometimes used to describe any local law, whether of a city or a province, as contrasted with the general law of Christendom, i.e. the Roman law, civil and canon. Later, with the development of international law, municipal law came to describe local law in contrast with international law. The term is no longer used in this way on the Continent: municipal law now means city law as contrasted with national law; but among English-speaking peoples national law is called municipal in contrast with international law. English municipal law has thus become the very inappropriate description of all the law, written or unwritten, by which England is governed in matters purely English.

The expression 'municipal law' is sometimes, however, employed in the United States in the Continental sense above indicated, to describe the organization of municipal corporations and the local laws enacted and enforced by municipal authorities. It is under this head (municipal corporations), therefore, that information concerning the organization of city, county, township, and village governments, the organization and jurisdiction of local courts, and police laws for the regulation and restraint of vice, may be found. See **MUNICIPALITY**. Consult the authorities referred to under **JURISPRUDENCE**.

MUNICIPAL LEAGUE, NATIONAL. An organization composed of associations seeking to accomplish municipal reform in the various cities

of the United States. It was established in New York in 1894, as the outcome of a national conference held in Philadelphia in July of that year to promote the interests of good government. It has no political interests whatever, but confines its operations to the securing of good municipal laws, the appointment of men of integrity and ability to office, and the correction of abuses in municipal methods of government in American cities. The reforms recommended by the League are being tried with considerable success by various municipalities throughout the United States, Cuba, Hawaii, and Porto Rico. The League is also directing attention to the question of instruction in municipal government, in American educational institutions, and to the subject of uniform municipal accounting and statistics. A meeting is held annually to confer and report on the subject of municipal reform.

MUNICIPAL OWNERSHIP. Possession by a municipality or any minor civil division of the State. The term is, however, more commonly limited to public as opposed to private ownership of water-works, lighting plants, street railways, telephone systems, and other revenue-producing industries designed to meet the wants of urban populations. The term generally implies municipal operation as well as ownership, but exceptions are frequent and sometimes notable. The term 'municipal socialism' has sometimes been used in much the same sense as municipal ownership; but it is more inclusive, embracing various efforts to meet the collective wants of a municipality, whether founded on municipal ownership or not. In its broadest sense, municipal socialism would provide for all wants common to the citizens of a municipality, in so far as they were not met by the State. A narrower usage would apply the term more particularly to unusual municipal enterprises, such as the management of coal-yards or bakeries. The term 'municipal trading' has been applied in England to municipal ownership, but it has not gained currency outside of Great Britain.

The services which a municipality may be expected to render its citizens are more comprehensive than those included under municipal ownership, municipal socialism, or municipal trading, as may be seen by referring to the article **MUNICIPALITY**. The object of the present article is to consider those undertakings which require the use of the streets or other public places, and which might be carried on by either municipal or private enterprise, but are actually carried on by the former. Since by their nature such undertakings exclude competition, they are called natural or municipal monopolies. Under either kind of ownership they can be carried on only by authority from the State, in the form of general or special legislation, besides which a private corporation must generally secure the grant of a municipal franchise permitting it to use the public streets. Within the limitations stated the most common objects of municipal ownership are sewerage systems and water-works, and gas and electric-lighting plants. More rarely street railways, ferries, and telephones are owned by the municipality.

Aqueducts for the supply of the cities of antiquity were the nearest approach to municipal ownership as the term is understood to-day, although from remote times cities have owned lands, improved harbors, built docks, and de-

rived revenues therefrom. But these services were confined to a relatively small number of important cities until the nineteenth century, when water-works, gas-works, electric-light and power plants sprang up with increasing rapidity. At the opening of the twentieth century these services were to be found in practically all the larger and in the majority of the smaller municipalities of the civilized world, particularly in the United States, Great Britain, and to a less extent on the Continent of Europe and in Australia.

The proper scope of municipal ownership is still a subject of debate. Perhaps the nearest approach to a general agreement is (1) that it may rightly embrace all those services which are primarily or largely of a sanitary character, like water supply and sewerage, and (2) that it should be restricted to quasi-public industries, in which private competition is impossible or at best uncertain. Under (2) some draw the line so as to include only imperative and universal needs, the supplying of which is at the same time a natural monopoly. The difficulty with such a limitation is that it varies with local conditions, time, and individual opinions. Thus the demand for public lighting in the larger cities of the present day is far more imperative than was that for a public water supply a hundred years ago, or in some localities to-day. There is a growing conviction that the relative cheapness and efficiency of service are the chief facts to be considered in deciding between public and private ownership, and that local conditions determine whether public or private ownership is the better in these respects. A third point upon which there is more or less agreement is that municipal ownership should not be carried so far as to increase municipal debts beyond prudent limits. So far as revenue-producing municipal works of a monopolistic character are concerned, it is generally possible so to adjust income and expense that the revenue from such undertakings will meet capital charges as well as other expenses. But there is also the possibility that the popular demand for low charges will result in a deficit that must be met from the general tax rate, and with a large number of municipal undertakings to be provided for it is conceivable that this might prove financially embarrassing if not disastrous.

WATER-WORKS. With the exception of sewerage systems, which rarely yield a revenue, water-works are the most common form of municipal enterprise.

The relative decrease in public ownership from 1870 to 1890 was due to the remarkable activity of private water-company promoters at a time when the municipalities were just awakening to the need for such improvements, but lacked the funds for public ownership, or had not become infused with its spirit. In the larger cities municipal ownership is the rule, all but eight of the 38 cities of over 100,000 population (census of 1900) owning their own works at the beginning of 1903. New York, which was first supplied by a private company in 1776, put municipal works in operation in 1842. Chicago was supplied by a company in 1840, and by its own works in 1854. Philadelphia built its works in 1801. At Boston a private company established water-works in 1652—the first public water supply in the United States. A second small company built works in

1796, and continued to operate on a small scale until 1893, when its pipes were bought by the city, which had built works in 1848. The Baltimore works were built by a company in 1807, and bought by the city in 1854. Cleveland built its works in 1854-56. At Buffalo a company established works in 1852 and was bought out by the city in 1868. In San Francisco the water-works are still under private ownership. At Cincinnati a company built works in 1820 and sold them to the city in 1839. Up to the close of 1896 changes from private to public ownership had occurred in 205 cities and towns, against only 20 changes from public to private ownership. There have been many changes to municipal ownership since 1896. In the North Central and Northwestern States municipal ownership is decidedly in the majority, and in the Pacific States the reverse is true. New England is about evenly divided, with Massachusetts strongly in favor of municipal ownership, and Maine even more strongly in favor of private.

In the *United States* in 1801 there were but sixteen works, of which only the plant at Winchester, Va., was owned by the city it served. The development of municipal ownership during the century is shown by the accompanying table:

NUMBER OF PUBLIC AND PRIVATE WORKS IN THE UNITED STATES AT THE END OF EACH DECADE, BEGINNING WITH 1800.*

YEAR	Public	Private	Total	Per cent. of total, public
1800.....	1	15	16	6.3
1810.....	5	21	26	19.2
1820.....	5	25	30	16.6
1830.....	9	35	44	20.5
1840.....	23	41	64	35.9
1850.....	53	50	103	39.7
1860.....	57	79	136	41.9
1870.....	116	127	243	47.7
1880.....	283	305	588	49.0
1890.....	806	1,072	1,878	42.9
1896.....	1,690	1,489	3,179	53.2

* Compiled from the *Manual of American Water-Works* for 1897. Figures for 1898, but excluding all places of less than 1000 population by the Census of 1890, published in the Report of the United States Commission of Labor for 1899, show 1787 municipal (53.73 per cent.) to 1539 private works.

In *Canada*, in 1896 municipal ownership prevailed in 75 per cent. of the municipalities having works, or 109 of 145 cities and towns. At Montreal water-works were built by a company in 1801 and bought by the city in 1845. At Toronto private works were built in 1841 and bought by the city in 1873.

In *Great Britain and Ireland*, in 1901, of 64 county boroughs in England and Wales, including the great towns, 45 owned their water supplies, and of the 141 other boroughs 139 had municipal works. All the large towns of Scotland own their works. In Ireland, Dublin and Cork have municipal service. About half the so-called urban districts in England, other than boroughs, have municipal works. Water-works appear to have been introduced by the municipality of London in 1283; by Plymouth in 1585; and Oxford in 1610. Manchester and Liverpool each bought out a private company in 1847, Glasgow in 1855, Birmingham in 1876, and Sheffield in 1888. Edinburgh transferred municipal works to a company in 1819, but they were restored to municipal ownership in 1869. Greater London has been served for years by eight com-

panies, beginning with the New River Company, whose works were completed in 1613 with the aid of James I. The other seven companies date from 1721 to 1822. After years of agitation for municipal ownership, a Parliamentary act was passed in 1902 providing for the purchase of the London companies and the control of the water supply by a joint board representing the several boroughs and the other public bodies comprised within what is known as Greater London. The transfer is to be made in June, 1904.

Most of the large cities of the *European Continent* have extensive water-works. In *Germany* practically all places of 50,000 population and upward have municipal works. Berlin secured control of her water-works in 1873, buying them from a company which began to build them in 1853. Hamburg and Frankfort-on-the-Main, Vienna, Moscow, Paris, Rome, and other large cities own their water-works. The municipal water-works of Rome may be said to date from 312 B.C. (See *AQUEDUCT*.) At Paris an old Roman aqueduct was restored in the seventeenth century, and a small municipal supply seems to have been continued from that date until more adequate works were installed by the city about the middle of the nineteenth century. As a rule, private ownership prevails in Latin-speaking countries. In Australia there are a number of important municipal works.

GAS-WORKS. In North and South America these are rarely under municipal ownership, but in Europe they are frequently owned by the municipality.

Of 981 towns in the *United States*, each having a population of 3000 and more by the census of 1900, returns for the close of 1901 showed 21 municipal works; but of these the Philadelphia plant was leased to a private company in 1897, after over fifty years of municipal ownership and operation. Two of the 21 municipal plants supply natural gas. The municipal works at Richmond, Va., were established in 1852.

Of 693 gas-works in *Great Britain and Ireland* reported late in 1901, 240 were owned by the municipalities served, and they supplied barely half the population involved. In 1883 there were only 143 municipal works. With the exception of London, Liverpool, and Dublin, nearly all the large towns have municipal works.

At least 41 of 54 cities of *Germany* having a population of 50,000 and upward have municipal works, and as far back as 1885 figures for the whole country showed 338 municipal to 329 private gas-works. Among the larger cities with private works are Munich, Frankfort-on-the-Main, and Altoma.

Municipal works are found in most of the cities of Holland, Norway, Sweden, and Switzerland, and in a few cities of France, Italy, and Australia.

SEWERAGE. Municipal ownership is almost universal, but many countries are practically without sewerage systems for household wastes. It is doubtful if any country is better provided with sewerage facilities than the United States, where 1096 of the 1524 places with a population of 3000 in 1900 reported sewerage systems late in 1901. Of the 1096 places with sewers, private ownership was reported in 47 instances. Most of these sewer companies were in small places; but Atlantic City, N. J., Wilmington, N. C., and Austin, Texas, each with more than 20,000 in-

habitants in 1900, were served by sewers owned by private companies.

STREET RAILWAYS. This class of service has been developed since 1850, and up to 1870 was confined chiefly to the United States. Municipal ownership outside of Great Britain is rare, and even there it has sprung up recently. In fact, until 1893 Huddersfield, England, and the railway on the Brooklyn Bridge were the only examples of municipal ownership and operation, the first dating from 1882 and the second from 1883. A few British cities constructed railway tracks and leased them to companies between 1870 and 1893. At the close of 1901 there were 40 municipalities in Great Britain that owned and operated horse or electric street railways, and 27 (including a few in the other list) that owned railways, but leased them to operating companies. Among the 40, such large cities as London, Manchester, and Sheffield are included, but there are also private lines in some of these 40 places. The operation of the railway on the Brooklyn Bridge, New York City, was assumed by a private company in 1898, in connection with the Brooklyn railway service. In 1901 the small city of Grand Junction, Colo., assumed the ownership and operation of a short horse railway line. In 1902 an electric railway at Saint Thomas, Ont., was taken over in like manner. The street railway system of Toronto, Ont., was bought by the city at the expiration of the franchise of a company in 1891. After being operated for a few months by the city it was sold to a company, under a contract providing for conversion, by the purchaser, from horse to electric traction, together with a payment to the city of a percentage of gross receipts increasing with the latter. In other countries than those already named there are a few street railways owned by the city and leased to operating companies. A subway to accommodate street railway traffic in congested districts of Boston has been built by the city and leased to a company, and the same general plan is being carried out on a much more comprehensive scale in New York.

ELECTRIC LIGHTS. This service was started on a practical scale in or about 1880.

Probably the first municipal plant in the *United States* was put in operation in 1882, at Fairfield, Iowa. At the close of 1898 there were in places of 1000 or over by the United States census of 1890, 460 municipal and 2572 private electric-lighting plants. At the close of 1901, in places of 3000 population and over, by the census of 1900, there were 193 cities and towns with municipal and 1190 with private plants, besides 85 cities having both. The largest municipal plants are at Chicago and Detroit; but these, like many other American municipal electric-lighting plants, are for lighting streets and public buildings only.

The first electric-lighting plant in the *United Kingdom* was established by a private company in 1882. The oldest municipal plant was started by Bradford, in 1889. At the close of 1901 there were only 248 works in operation in the United Kingdom, of which 168 were municipal. In addition, 84 municipalities and 31 companies were then installing works. Among the larger municipalities Glasgow bought out a company in 1892, Liverpool in 1897, Leeds in 1898, Sheffield in 1899,

and Birmingham in 1900; Dublin built works in 1892, and in 1893 Edinburgh and Manchester did likewise. London is divided between municipal and private ownership, with the latter far in the lead. From the outset municipal ownership of electric-lighting plants has been encouraged by the general Government; and that to such an extent, especially in the earlier years of the industry, as to check the growth of private plants.

On the *Continent of Europe* private ownership of electric-lighting plants seems to be the rule, with some exceptions in the northern part. The works at Berlin were opened by a company in 1886, but the city controls their operation in important particulars, and shares largely in the gross receipts. At Hamburg, Germany, municipal works were put in operation in 1889.

TELEPHONES. This service, like the telegraph, is national rather than municipal in scope, and is generally controlled by large companies, as in the United States, or by the general governments, as in many countries of Europe, in Japan, and in Australia. Tunbridge Wells, England, and Glasgow, Scotland, inaugurated the first municipal telephones in Great Britain in 1901, and early in 1902 some 40 other plants or projects were under way. The English trunk lines are owned by the national postal authorities; municipal telephones are reported at Amsterdam.

FERRIES. In the United States there are about 10 cities with municipal ferries to 70 with private ones, Boston being the most notable example of municipal ownership. In Great Britain a large municipal ferry between Liverpool and Birkenhead is owned and operated by the latter municipality. Public bodies at Glasgow and at Belfast also control ferries. There are a few other municipal ferries in Great Britain.

OTHER INDUSTRIES. The chief additional services that might properly be discussed under municipal ownership, as here considered, are docks and wharves and public markets. The former, particularly on a large scale, are more frequently found in Europe than in America; but New York City has expended many millions on dock construction, and receives a considerable yearly revenue from dock leases. Municipal markets are common in Europe, Australia, and Canada, where they are frequently exclusive in character. In the United States they exist, but they are in competition with private markets. Of cities and towns of over 30,000 inhabitants 129 were reported in 1901 to have municipal markets, but doubtless the list was incomplete, and at the same time it included some outdoor markets or market places. New York, Boston, Baltimore, and New Orleans have large markets, which yield considerable revenue. Subways for electrical wires have been constructed in a number of American cities for lease to the various owners of wires. A few cities have built subways for general use and receive a rental therefrom.

MUNICIPAL REFORM ACTS, ENGLISH. The various acts passed by Parliament in the nineteenth century aiming to reform the government of the English municipalities. The Parliamentary reform of 1832 having left untouched the notorious abuses in the English system of municipal government, a Parliamentary commission was appointed the following year to investigate exhaustively the general condition of municipal corporations throughout the Kingdom. A monumental report was made by the commission showing that the municipal governments were in the hands of self-elected cliques; that the corporate funds were wasted; that public improvements were almost wholly neglected; that the municipal courts were corrupted and prostituted for party purposes; and that the whole system of municipal institutions as then constituted was a source of weakness rather than of strength to the country at large. The report of the commission was followed by the Municipal Corporations Act of 1835, which has been well called "the great charter of English municipal freedom." By this act 178 boroughs were reformed, 125 others given corporate privileges, and provision was made for the remedying of many defects, and the correction of the most notorious abuses of the municipal system. It admitted to the franchise all property-owners and occupiers of property rated at £10 per annum, and established a uniform system of municipal organization. This scheme provided first for an elected council, varying in size according to the population of the borough; the council was to be a bicameral body, the Upper House consisting of a certain number of aldermen elected by the council. The act further provided for a mayor to be chosen by the body of councilors and aldermen from among their own members. The mayor, aldermen, and councilors were to constitute the full municipal governing body. The chief features of this act have remained as the framework of the English municipal constitution; although the various acts of Parliament, passed from time to time, modifying in unessential particulars the municipal structure made a consolidation and revision of the statutes necessary. This was accomplished by the consolidated municipal code of 1882. By the Local Government Act of 1888 the municipal constitution was modified to the extent that cities and towns with a population of 50,000 inhabitants were made distinct counties for administrative purposes, the municipal councils assuming all duties which would otherwise devolve upon county councils. Consult: Chalmers, *Local Governments* (London, 1883); Goodnow, *Comparative Administrative Law*, vol. i. (New York, 1897); Shaw, *Municipal Government in Great Britain* (ib., 1895). See works referred to under MUNICIPAL GOVERNMENT; MUNICIPALITY.

MUNK, munk. HANS (1589-1628). A Danish navigator, born at Elsinore. In 1619, by order of King Christian IV., he set out with two ships to discover the northwest passage to the Indies. He penetrated Davis Strait as far north as 69°, and then turned southward and spent the

winter on Chesterfield Inlet. Cold, famine, and scurvy destroyed so many of his men that when he regained the coast of Norway in September, 1820, only two persons besides himself survived. He sailed on a second voyage in 1821, and upon his return in 1823 reported that he had reached 75° north latitude, and had seen an open sea beyond. An account of his first voyage was published at Copenhagen in 1823, under title of *Efterretning af navigatøren og reisen til den Nye Danmark af Styrmand Hans Munk*.

MUNK, HERMANN (1839—). A German neurologist. He was born at Posen, studied at Berlin and Göttingen, and in 1862 became docent in the former university. Seven years afterwards he was promoted to assistant professor of physiology, and in 1876 he was placed at the head of the physiological laboratory in the veterinary college. In 1897 he became full professor in the university. Besides studies on the productive methods of threadworms, Munk wrote on the physiology of the nerves and especially on the brain: *Untersuchungen über das Wesen der Nervenregung* (1868) and *Ueber die Funktionen der Grosshirnrinde* (2d ed. 1890).

MUNK, SALOMON (1805-67). A French Orientalist. He was born in Glogau, Silesia, of Jewish parents, studied at Berlin, Bonn, and Paris, and in 1840 was made custodian of Oriental manuscripts in the Paris National Library. He accompanied Montefiore and Crémieux to Egypt, bringing back many valuable manuscripts. Although he had become blind, he was in 1865 appointed professor of Hebrew, Chaldee, and Syriac in the Collège de France. He was a member of the Académie des Inscriptions et Belles-Lettres, and published an edition (with French translation) of the *Guide of the Perplexed* (1856-66) by Moses ben Maimon (see **MAIMONIDES**). His further works include *Palestine* (1845) and *Philosophy Among the Jews* (1848).

MUNKÁCS, mun'kách. A town of Hungary, situated on the River Latorcza, about 70 miles east-southeast of Kaschau (Map: Hungary, H 2). It has manufactures of coarse cloth. In the vicinity are mined alum, iron, and crystals. The fortress of Munkács, situated on a rock near the town and used as a prison, is noted for its many sieges, especially for its defense against the Austrians, to whom it surrendered in 1688 after a siege of three years, the garrison having been commanded by Helen Zrinyi, the wife of the patriot leader Tökölyi. Population, 1900, 14,416.

MUNKÁCSY, mun'ká-chá, MICHAEL (1844-1900). An Hungarian historical and genre painter, whose real name was Michael Lieb. He was born at Munkács, February 20, 1844, the son of a petty official, became an orphan at an early age, and in 1855 was apprenticed to a joiner. After several years of hard work and privation, chance threw him in the way of the portrait-painter Szamosy at Gyula, who aided and befriended him, as did also the landscape painter Ligeti, at Budapest, whither Munkácsy had gone in 1863. A small grant from the art society there enabled him to study for a year (1865) at the Academy in Vienna, after which he proceeded to Munich, where he studied under Alexander Wagner, and found a special protector in Franz Adam, the battle painter. In 1868 he went to Düsseldorf to

work under Knaus. Two years later his first important picture, "The Last Day of a Condemned Man" (in the collection of Mrs. W. P. Wiltach, Philadelphia), took Paris by storm, bringing him the gold medal. His future was forthwith assured, and in 1872 he took up his residence in Paris, where for several years he continued to depict episodes from the popular life of his native country with impressive truthfulness and a sombre, blackish coloring. In 1876 he entered upon a new field, painting a series of charming Paris interiors, in which he adopted a richer coloring, but his most important production of this period was "Milton Dictating Paradise Lost" (1877, Lenox Library, New York). It was not, however, until 1881 that he reached his own ideal with the completion of the now world-famous "Christ Before Pilate" (John Wanamaker, Philadelphia), which has become one of the most widely discussed pictures of recent times. It was exhibited all over Europe and in the United States in 1886, on which occasion Munkácsy visited New York. In 1884 he painted his second biblical subject, "Christ on Calvary," like its predecessor replete with dramatic life, treated in the light of history with ethnographic reality and supreme coloristic vigor. It also was brought to America in 1887, and the artist's next important work, "The Last Moments of Mozart" (1886), a touching representation of the dying composer rehearsing his famous *Requiem*, found its way into the collection of Gen. Russell A. Alger, Detroit, Mich. His subsequent creations were of a decorative character, and comprise the "Apotheosis of the Fine Arts," for the Art-Historical Museum in Vienna, and "Árpád Taking Possession of Hungary" (1896), for the new House of Parliament in Budapest. The strain and disappointments connected with this work brought on a mental disease, and the artist passed the last three years of his life in the sanitarium at Endenich, near Bonn, where he died, May 1, 1900. Many of the prominent public and private collections of the United States contain examples of his paintings. Consult: Tahi, in *Die Kunst für Alle*, xv. (Munich, 1900).

MUNN, ORSON DESAIX (1824—). An American journalist and lawyer, born in Hampden County, Mass. He was educated at the Monson Academy. In 1846, in conjunction with Alfred E. Beach, he bought the *Scientific American*, which had been founded six months before. In 1876 he began to issue the *Scientific American Supplement*, and in 1885 he established a monthly *Architects' and Builders' Edition*.

MÜNNICH, mu'ník, BURKHARD CHRISTOPH, Count (1683-1767). A Russian general and statesman, born at Neuenhuntrorf in Oldenburg, Germany. In the War of the Spanish Succession, he served as captain of Hessian troops. He became a colonel in the Polish army in 1716, entered the Russian service in 1721, and six years afterwards became general. He was created commander-in-chief of the Russian army by Peter II. in 1727, and in 1732 was made field marshal and president of the War Council. He played a distinguished part in the war with Turkey, overran the Crimea in 1736, and advancing beyond the Dniester, made himself master of Moldavia. After the death of the Empress Anna Ivanovna in 1740, he opposed the party of Biron, the Regent, whom he overthrew. The regency was con-

ferred on Anna Karlovna, mother of Ivan, the young heir to the throne, and Münnich became Chief Minister and the most powerful man in Russia. After the coup d'état which placed Elizabeth Petrovna on the throne (1741), Münnich was arrested, and the sentence of death passed upon him was changed only at the foot of the scaffold to exile in Siberia, where he remained for twenty years. Peter III. restored to him his estates in 1762, and he was made director-general of the Baltic ports by the Empress Catharine. Consult: Halem, *Geschichte des Feldmarschalls Grafen Münnich* (Oldenburg, new ed., 1838).

MUÑOZ, mōōnyōth, JUAN BAUTISTA (1745-99). A Spanish historian, born at Museros, Valencia, and educated at the University of Valencia. His leading work was *Historia del nuevo mundo* (1793), which Charles III. had commissioned him to write. It follows the course of American discovery down to 1500. The council of the Indies, to which he had been appointed cosmographer (1770), forbade its publication; but Charles IV. sanctioned it, despite the author's revelations concerning the atrocious treatment of the aborigines by Spaniards in the New World. Some writings of Muñoz are to be found in vol. lxii. of the *Biblioteca de autores españoles* and elsewhere in the collections of the Academy of History, Madrid, but many of his manuscripts were burned in the library of Valencia when that city was stormed by the French (1812).

MUNRO, HUGH ANDREW JOHNSTONE (1810-85). An eminent English classical scholar. He was born in Elgin, Scotland, was educated at Trinity College, Cambridge, and was from 1869 to 1872 the first university professor of Latin at Cambridge. His edition of Lucretius (4th ed. 1885), with commentary and prose translation, remains one of the standard English contributions to Latin scholarship. His edition of Horace (1868), containing a valuable introduction, and his *Criticism and Elucidations of Catullus* (1878) are also highly esteemed. He contributed to the *Journal of Philology* and other learned periodicals, and wrote much Greek and Latin verse.

MUNRO, NEIL (1864—). An English novelist, born at Inveraray, in Argyllshire, Scotland, June 3, 1864. He was educated at the parish school, and subsequently entered the office of the *Glasgow Evening News*. He is the author of admirable tales and romances dealing with life in the Scottish Highlands. They include: *The Lost Pibroch* (1896); *John Splendid*, which gained him his reputation (1898); *Gillian, the Dreamer* (1899); and *Doom Castle* (1901).

MUNRO, Sir THOMAS (1761-1827). A Scottish major-general, Governor of Madras, born and educated in Glasgow. He was noted as a civil ruler, beginning with his appointment to the newly acquired district of Baramahal. Afterwards he was made Governor of Canara, and then of Ballari, Cuddapah, Karnul, and the Palnad, where his wise rule was most effective in quelling disorder. He established the ryotwar system of land tenure now in vogue throughout a large part of British India, whereby peasants may hold property by paying a land tax to the State. In 1819-26 he was Governor of Madras.

MUNROE, mūn-rō, CHARLES EDWARD (1849—). An American chemist and educator. He

was born at Cambridge, Mass.; graduated from the Lawrence Scientific School in 1871, and in the same year became assistant in chemistry. From 1874 to 1886 he was professor of chemistry at the United States Naval Academy, and then devoted himself to the study of explosives. In 1886 he was appointed chemist to the torpedo corps at Newport, R. I., and in 1892 received a chair in chemistry and the post of senior dean in Columbian University. Munroe invented a smokeless powder, and attained an international reputation as an authority on explosives. His publications include *An Index to the Literature of Explosives* (1886).

MUNROE, KIRK (1856—). An American writer of books for boys, born near Prairie du Chien, Wis. He studied civil engineering at Harvard, and while professionally engaged on the routes of the Northern and the Southern Pacific railways gained material for many of his tales. Afterwards he worked for various newspapers in New York City, and was the first editor of *Harpur's Young People* (1879-82), but on his marriage with a daughter of Amelia Barr, the novelist, went to reside in southern Florida, a district that colored his writings, which include: *The Flamingo Feather* (1887); *Dory Mates* (1889); *The Fur Seal's Tooth* (1893); *At War With Pontiac* (1895); *With Crockett and Bowie* (1897); *Under the Great Bear* (1900); and *The Belt of Seven Totems* (1901).

MUNSEE. A subtribe of the Delaware (q.v.), originally constituting one of the three great divisions of that tribe and dwelling along the upper streams of the Delaware River, and the adjacent country in New York, New Jersey, and Pennsylvania. They were considered the most warlike portion of the tribe and assumed the leadership in war councils. From their principal totem they were frequently called the Wolf tribe of the Delaware. They were prominent in the early history of New York and New Jersey, being among the first tribes of that region to meet the whites. By a noted fraudulent treaty known as the Walking Purchase, the main body was forced to remove from the Delaware River about the year 1740. They settled on the Susquehanna, on lands assigned them by the Iroquois, but soon afterwards moved westward and joined the main Delaware tribe on the Ohio River, with whom the greater portion eventually became incorporated. A considerable body, who were converted by the Moravian missionaries, drew off from the rest and formed a separate organization, most of them removing to Canada during the Revolution. Others joined the Ojibwa and Stockbridge Indians. The majority were incorporated in the Delaware, with whom they participated in their subsequent wars and removals. Those who still keep the name of Munsee are in three bands, two of which are consolidated with other tribal fragments, so that no separate census is available. These tribes are the Munsees of the Thames, Ontario, Canada, 120; Munsee (or Christian), and Chippewa, northeastern Kansas, 90; and Stockbridge and Munsee, Green Bay Agency, Wis., 530. Those of the United States are officially reported as civilized and entirely competent to manage their own affairs. The mixed band in Kansas has dissolved tribal relations.

MUNSELL, mūn'sēl, JOEL (1808-80). An American editor, publisher, and antiquary, born

in Northfield, Mass. He settled in Albany, N. Y., in 1827, and entered journalism. He subsequently became the editor of various publications, among which were the *New York State Mechanic*, the *Lady's Magazine*, and the *New England Historical and Genealogical Register*. He rendered valuable services to the cause of American history by publishing the *Annals of Albany* (10 vols., 1849-59); *Collections on the History of Albany* (4 vols., 1855-57); and a series of books, some of considerable value, known as the "Munsell Historical Series."

MUNSEY, mŭn'sl, FRANK ANDREW (1854-). An American publisher, born at Mercer, Maine. In 1882 he established at New York City *The Golden Argosy*, a children's weekly, which he afterwards changed to *The Argosy*, a monthly for adults. In 1890 he founded *Munsey's Weekly*, which he changed to the monthly *Munsey's Magazine* the next year. He also founded *The Puritan* and the *Junior Munsey*, and afterwards obtained control of the *Washington Times*, the *New York Daily News*, and the *Boston Journal*.

MUNSON, mŭn'son, JAMES EUGENE (1835-). An American inventor, born at Paris, Oneida County, N. Y. He studied for a time at Amherst, then removed to New York City, where he became a court stenographer, a position which he held for more than thirty years. He formulated the Munson system of stenography, an automatic typesetting machine, and a mechanism of operating typewriting machines by telegraph, and published a number of books of phonography.

MUNSTER, mŭn'stēr. The capital of the Prussian Province of Westphalia, situated in a level district at the confluence of the Aa with the Münster Canal, 65 miles northeast of Düsseldorf (Map: Prussia, B 2). The town is mediæval in appearance, with its ancient gabled buildings, old Renaissance houses, rococo dwellings of the eighteenth century, arcaded markets, and shaded allées. The site of the former fortifications, which divided the old and new towns, has been converted long since into promenades. Münster has many churches, of which two are prominent: Saint Lambert's and the cathedral. The former is a graceful, pleasing structure. It is Gothic, dates from the fourteenth century, has been restored in recent times, and possesses a majestic new tower. The church is associated with the history of the Anabaptists in the sixteenth century. The cathedral is of the thirteenth century, and has some noteworthy features, though none of great interest. The imposing Church of Our Lady also merits mention as well as the beautiful Romanesque tower of the Ludgerikirche.

The Rathaus is a handsome, gabled, Gothic structure. The Peace of Westphalia was signed in it in 1648, in a curious room called the Friedenssaal, which contains portraits claimed to have been painted by Terburg. Among the interesting old buildings are also the Renaissance Weigh House; the Renaissance Stadtkeller, the headquarters of the Kunstverein, with pictures of minor value; and the Schuhhaus, or the ancient guild-hall of shoemakers. The castle was the episcopal residence in former times, and is now occupied by the leading officials of the city. In its grounds is a botanical garden. The Government offices, the law courts, and the attractive

Gothic post-office are modern. The splendid modern Ludgerus fountain is adorned with interesting religious statues. The Roman Catholic university, which ceased to exist as such in 1818, when the institution was reduced to a theological and a philosophical faculty (which figured as the Academy of Münster from 1843), was revived in 1902 by the establishment of a faculty of law. Noteworthy also among the many educational institutions are the royal pedagogical seminary, a seminary for priests, and two 'Konvikte.' Münster has a Museum of Christian Art, the Pauline Library, with about 115,000 volumes, and an extensive Roman Catholic gymnasium. There is a notable zoölogical garden, which is much frequented by the citizens, and contains an antiquarian collection. The industrial products of Münster include leather, linen and cotton fabrics, starch, thread, and sugar. There are also carriage works and distilleries. A large trade is carried on in the produce of the country. Carriages and sculptures of stone are exported. The population in 1871 was 24,815; in 1901, 63,776, mostly Catholics.

HISTORY. Münster had its origin in a celebrated monastery which appears as early as the time of Charles the Great. A considerable settlement sprang up around the monastery in the first part of the twelfth century. The town received municipal rights about 1180, and in the course of many years the inhabitants succeeded in vindicating their liberties against their feudal lords, the bishops of Münster. In the thirteenth century Münster entered the Hanseatic League. In the fifteenth century it became a centre of learning and religious life, and during the Reformation suffered greatly from the strife of parties. In 1533 Münster fell into the power of the Anabaptists, whose leader, the celebrated John of Leyden (q.v.), erected the city into a kingdom of Zion with himself as sovereign (1534). The city was taken by the Bishop in the following year, and John of Leyden was put to death. Against the ambitious and warlike Bernhard of Galen, Bishop of Münster, the city carried on a desperate struggle in defense of its rights, but it was finally compelled to submit with the loss of almost all its liberties (1661). The Bishopric of Münster, which held a prominent place among the ecclesiastical States of the old German Empire and embraced a territory of nearly 4000 square miles, was secularized in 1803.

MUNSTER. The largest of the four provinces of Ireland, occupying the southwest part of that country and bounded north by Connaught, east by Leinster, and west and south by the Atlantic (Map: Ireland, C 4). It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford. Area, 9481 square miles. The population of the province in 1841 was 2,404,460; in 1891, 1,173,643; and in 1901, 1,075,075.

MUNSTER, mŭn'stēr, SEBASTIAN (1489-1552). A German theologian and geographer. He was born at Ingelheim, studied at Heidelberg and Tübingen, and in 1529 left the Catholic Church for the Reformed. He was professor of theology and Hebrew at Heidelberg until 1536, when he became professor of mathematics at Basel. He edited in 1534 the first Hebrew Bible to appear under the care of a German. But his chief work was his *Cosmographia* (1544), a geog-

raphy which was translated into Italian, French, and Latin, and passed through twenty-four editions in a hundred years.

MÜNSTERBERG, mün'stër-bërk, HUGO (1863—). A German-American psychologist, born in Danzig. He received the degree of Ph.D. at Leipzig in 1885 and that of M.D. at Heidelberg two years afterwards, and taught psychology at Freiburg for five years (1887-92). In 1892 he became professor of psychology at Harvard University. He devoted himself mainly to the physiological side of the science, and it was under his supervision that the psychological laboratory at Harvard was organized. His more important publications are: *Die Willenshandlung* (1888); *Gedankenübertragung* (1889); *Der Ursprung der Sittlichkeit* (1889); *Beiträge zur experimentellen Psychologie* (1891); *Psychology and Life* (1899); *Grundzüge der Psychologie* (1900); *American Traits* (1901).

MÜNSTER-LEDENBURG, mün'stër lä'den-böörk, ERNST FRIEDRICH HERBERT, Graf zu (1766-1839). A Hanoverian statesman. He was born at Osnabrück; studied at Göttingen, and in 1788 entered the governmental service of Hanover. For three years (1801-04) he was Ambassador to Saint Petersburg, and as Cabinet Minister at London immediately afterwards did much to bring about the entente between Russia and England. His foreign policy was marked by deep opposition to Napoleon. In 1813-14 he was at the headquarters of the allied forces, and he was a member of the Vienna Congress (1814-15). In Germany his programme was progressive, but anti-Prussian; the constitution of the Kingdom of Hanover and its formation in the midst of Prussia may be considered typical of his policy. In 1831 Münster retired from office. Consult Hormayr, *E. F. H. Graf Münster* (Jena, 1875).

MÜNSTER-LEDENBURG, GEORG HERBERT, Graf zu, Freiherr von Grotthaus (1820-1902). A German diplomat, son of the foregoing, born in London, England. He was educated at Bonn, Heidelberg, and Göttingen, served for a time in the first chamber of the Hanoverian Parliament, and from 1856 to 1864 was envoy extraordinary of the Government of Hanover at the Court of St. Petersburg. After the annexation of Hanover to Prussia in 1866 he declared himself pro-Prussian, and from 1867 was a member of the Upper House. He represented Goslar in the Diet of the North German Confederation from 1867 to 1870, and in the German Reichstag from 1871 to 1873. He became Ambassador at London in 1873, at Paris in 1885, and in 1900 retired from the diplomatic service. He wrote several works on contemporary German and Continental public affairs, including *Politische Skizzen über die Lage Europas vom Wiener Kongress bis zur Gegenwart* (1867), and *Der norddeutsche Bund und dessen Uebergang zu einem deutschen Reiche* (2d ed. 1868).

MUNTANER, möön'tä-när', EN RAMÓN (1265-1336). A Spanish chronicler, born at Perallada, in Catalonia. On the burning of his native town by the French he became a wandering soldier and minstrel, and for thirty years led an adventurous life. Having returned to Catalonia, he began in 1325 to write in Catalan the history of the princes of Aragon from the time of James the Conqueror to the coronation of Alfonso IV. This chronicle of great events, of which he was an eye-witness, is valuable for the history of

his time, and is remarkable for its accuracy, homeliness, epic beauty, and grace. It remained in manuscript until the middle of the sixteenth century. The most ancient editions of the original are those of Valencia (1558) and Barcelona (1562). The former is entitled *Chronica o descriptio dels fets e hazanayes del inclyt Rey Don Jaumes Primer . . . e de molts de sos descendents*, etc. It has been translated into German, Italian, and French. Lanz published an edition of the original at Stuttgart in 1844. Consult also the edition by A. de Bofarull (Barcelona, 1860).

MUNTJE, mün'te, LUDVIG (1841-96). A Norwegian landscape painter, born at Aaröen, near Bergen. He was first instructed by Schiertz, a German painter and architect at Bergen, and then became a pupil of Flamm at Düsseldorf, which he subsequently selected for his permanent residence. A thoroughly realistic treatment characterizes his paintings, of which autumn and winter scenes in stormy or gloomy weather, forest and coast views form the prevailing subjects, and which may be judged by such specimens as a "Pine Forest in Winter" (1870), Hamburg Gallery; "Wood Interior in Winter, with Stags" (1878), National Gallery, Christiania, which was awarded the gold medal in Paris; "Birch Wood in Autumn" (1886), and "Autumn in Holland" (1895), both in National Gallery, Berlin.

MUNTJAC (Javanese name). Any of a genus (*Cervulus*) of small Oriental deer which dwell solitarily in the jungle, and whose young are spotted. The species best known is that of

THE INDIAN MUNTJAC.

India, called 'barking deer' by Anglo-Indian sportsmen, or 'kakar' (*Cervulus muntjac*) by the Hindustani. It is a little larger than a roebuck. Its lyrate antlers are peculiar in that they rise from pedicels about five inches high, or as long as the antler itself, and have only one short basal spur. The female has no antlers; nor has she the great exposed upper canine tusks, which, like those of the musk, are the effective weapons of the bucks in their fights. Allied species, some with smaller horns, are found in China and the Malayan islands, and an interesting fossil genus (*Amphitragulus*), inhabiting Tertiary Europe, was totally hornless in both sexes. See Plate of FALLOW DEER, MUSK, ETC.

MÜNTZ, munts, CHARLES ACHILLE (1846—). A French agricultural chemist, brother of the art critic Eugène Müntz. He was born at Suls,

Alsace, studied under Boussingault in Paris, and, after acting as his assistant for ten years, succeeded him as director of the chemical laboratories in the Institut National Agronomique. Müntz made special research on the feeding of cattle and horses, and, following Boussingault's method, tested his theories by practice on great herds, on Parisian cab horses, and, in the case of his contributions to viniculture, in various vineyards. He founded a Bibliothèque de l'Enseignement Agricole, published the results of his experiments in the *Annales* of the Agricultural Institute, and other chemical and agricultural journals, and wrote: *Recherches sur l'alimentation des chevaux*, with Girard (1884); *Les engrais*, with the same (1888-91); and *Les vignes* (1895).

MÜNTZ, EUGÈNE (1845-1902). A French art critic, born at Sulz, Alsace. He took Taine's place as professor of the history of art at the Ecole Nationale des Beaux-Arts, where he lectured from 1885 to 1893. He made a specialty of Italian art, and the following works are of unique value: *Notes sur les mosaïques de l'Italie* (1874-92); *Les arts à la cour des papes pendant le XV^{ème} et le XVI^{ème} siècle* (1878-98); *Les précurseurs de la Renaissance* (1881); *Histoire de la tapisserie* (1882); *Etudes sur l'histoire de la peinture et de l'iconographie chrétiennes* (1882); and *Histoire de l'art pendant la Renaissance*, vol. i., *Italie: les primitifs* (1888); vol. ii., *Italie: l'âge d'or* (1892); vol. iii., *Italie: la fin de la Renaissance* (1895); *Léonard de Vinci, l'artiste, le penseur, le savant* (1899).

MÜNZER, mun'tsēr, THOMAS (c.1489-1525). A religious enthusiast of the German Reformation, born at Stolberg, in the Harz Mountains. He acquired a good knowledge of theology, taught at Aschersleben and Halle, became in 1519 chaplain of a nunnery at Beutwitz, and in the following year received a call as preacher to Zwickau. There he gained great popularity by his attacks on the monastic and mendicant Orders. In 1521 he was compelled to leave the town, and went to Bohemia, where his preaching, however, met with little sympathy. In 1523 he became pastor at Allstedt, in Thuringia, married a nun who had abjured her vows, and carried on his pastoral work in full sympathy with the advanced representatives of the Reformation. He was an ardent champion of German nationality, and was the first to substitute German for Latin in the liturgy. He stood in close touch with Carlstadt and shared the latter's iconoclastic ideas. In time he developed a fanatic mysticism whose chief tenet was the validity of inner revelation, and he attacked as 'new papists' those reformers who set up the Gospel above personal justification. His ideas partook also of a political and social nature; he preached the speedy coming of God's kingdom on earth, and sought to organize the peasants and the artisans of the towns into secret associations looking, it is asserted, to the destruction of all authority and the establishment of communal property. In August, 1524, he was expelled from Allstedt and betook himself to Mühlhausen, where he joined forces with Heinrich Pfeifer, a renegade monk, who had succeeded in gaining great influence over the lower classes. Together they were driven from the city in September, and Münzer wandered through Southern Germany and

Switzerland, forming close relations with the Anabaptist leaders and hastening in no small degree the peasant uprising in those regions. He returned to Mühlhausen in December, and with Pfeifer, who had likewise reentered the city, assumed leadership of the discontented masses. The old council was overthrown, and a new council was installed under the control of Münzer. Mühlhausen speedily became the centre of a violent agitation. The opposition of the nobles was ineffectual; but at Frankenhäusen, on May 15, 1525, Münzer's peasant mob was almost annihilated by the force of Philip of Hesse, the Elector of Saxony, and the Duke of Brunswick. (See PEASANT WAR.) Münzer escaped from the battlefield, but was captured at Frankenhäusen and taken to the Castle of Heldrungen, where he was put to the torture. On May 25th he was decapitated at Mühlhausen, together with Pfeifer and twenty-four other leaders of the peasants. Fanatic though he undoubtedly was, there is nothing to disprove Münzer's warm love for the common people, whose cause he upheld against Luther, accusing the latter of fawning on the German princes while seeking to appease the peasants with empty words about the responsibility of rulers to God. Consult: Strobel, *Leben, Schriften und Lehren Thomas Münzers* (Nuremberg and Altdorf, 1795); Seidemann, *Thomas Münzer* (Dresden and Leipzig, 1842).

MUNZINGER, mun'tsing-ēr, WERNER (1832-75). A Swiss traveler and linguist. He was born at Olten, was educated at Bern, Munich, and Paris, and in 1853 joined a mercantile establishment at Alexandria, Egypt. He was attached to the expedition of Von Heuglin in 1861, but quitted it when it reached North Abyssinia, and in company with Kinzelbach explored an unknown territory. In 1862 he was placed at the head of the German exploring expedition, succeeding Heuglin, but was unable to penetrate farther than Kordofan. In 1864 he was appointed British consul at Massowah and in the Anglo-Abyssinian War acted as a guide to the English forces, after whose withdrawal he remained at Massowah as consul in the French service. In 1870 he made a journey to Southeast Arabia, and was appointed by the Khedive Governor of Massowah. In 1872 he was made Pasha and Governor-General of the Eastern Sudan, and in 1875 was mortally wounded while leading an expedition against Abyssinia. He published: *Sitten und Recht der Bogos* (1859); *Ostafrikanische Studien* (1864); *Vocabulaire de la langue Tigré* (1865).

MUONGS, mōō'ngz. A people who, together with the Thos, also dwelling in Northeastern Tongking and Annam and the adjoining parts of China, constitute, in the opinion of some leading anthropologists, one of the four chief groups of the Thai stock, of which the Siamese are the best-known members. The Farther Indian Muongs inhabit the basin of the Black River, and the Thos that of the Claire, while the great mass of the primitive population of the Chinese provinces of Kwang-si, Southern Kwei-chow, Northwestern Kwang-tung, Eastern Yun-nan, and perhaps also the Le of the island of Hainan, belong in this group of primitive Thai peoples. The Pueun and Pu-thai of Annamese Laos closely resemble in physical characteristics and language the Muongs of Tongking. A number of the Thos-Muongs tribes have methods of writing of their own resembling those of the Laotians, and

apparently not derived from Chinese, even in the case of the tribes of this group resident in China. Like some others of the primitive population of this part of the world, they impress one as being rather non-Mongolian in physical characters. Consult: Colquhoun, *Across Chryse* (London, 1883); Baber, *Travels in Inland and Western China* (ib., 1882-86); Bourne, *Journey in South-western China* (ib., 1888); Henry, *Ling-Nam* (ib., 1886); Hosie, *Three Years in Western China* (ib., 1890); Garcin, *Un an chez les Muongs au Tonkin* (Paris, 1891).

MURA, mōō'rá. A populous but inferior tribe of Tupian stock (q.v.), residing along the Amazon River, Brazil, from the confluence of the Madeira as far as the Purús. They were formerly very formidable and hostile to the Portuguese, but were completely crushed by the Mundurucú (q.v.) in 1788. Since that time some of them have come into the Portuguese settlements for protection and have acquired a rudimentary civilization; but those of the interior and upon the Purús are still in their original savage condition. Their houses, grouped in small villages, are mere roofs supported upon poles, without walls. They do not cultivate the ground, but live upon fish, game, and wild fruits, using bows six feet long, spears, and well-made canoes. They are much addicted to a sort of narcotic snuff prepared from the seeds of a species of mimosa. They were formerly naked, but those near the settlements now wear clothing. They carry on a trade with the Brazilians in sarsaparilla, turtle oil, and Brazil nuts, in exchange for cotton cloth, knives, spear and arrow heads. They are described as lazy, drunken, dishonest, and quarrelsome, and are among the lowest of all the Amazonian tribes.

MURAD, mōō'rād. The name of five Turkish sultans. See AMURATH.

MURADABAD, mōō'rūd-ā-bād', or **MORADABAD**. The capital of a district of the United Provinces, British India, on an elevation on the right bank of the Ramganga, and on the Oudh-Rohilkand Railway, 50 miles northwest of Bareilly (Map: India, C 3). It has two mosques, dating respectively from 1628 and 1636, an American Methodist mission church, built in 1874, and the Anglican Church of Saint Paul. The cantonment and civil administrative offices are on the northwest. Muradabad is noted for its engraved metal ware, and has cotton factories and several printing establishments. There is an extensive trade in the agricultural and other products of the district. The town is administered by a municipal council of twenty-three members, eighteen of whom are elected. Muradabad was founded by Rustam Khan in 1625. The ruins of his fort, with brick walls from four to six feet in thickness, overlook the river. Population, in 1891, 72,921; in 1901, 75,128.

MURÆNA, mû-rē'ná. A fish. See MORAY.

MURAL CIRCLE. An astronomical instrument formerly used for measuring the declinations of stars. The principle of its construction was somewhat similar to that now used for the meridian circle, by which it has been replaced. See MERIDIAN CIRCLE.

MURAL CROWN. In heraldry, a crown in the form of the top of a circular tower, masoned and embattled.

MURAL DECORATION (from Lat. *muralis*, relating to a wall, from *murus*, OLat. *mærus*, wall). Art applied to the adornment of wall surfaces. Wall painting in fresco, in oils, in encaustic; figured sculpture in low relief, colored or plain, in stone, marble, terra-cotta, or stucco; mosaic compositions, marble incrustations, and sectile work, and wainscoting in carved and paneled woodwork, are the principal modes used for the purpose. The term is commonly made to include also, by extension, the decorative treatment of vaults and ceilings, as well as walls. For details, consult the special articles, such as **Fresco**, **MOSAIC**, **BYZANTINE ART**, and others of this kind.

EGYPT. In ancient Egypt flat undecorated walls were avoided; the internal surfaces of the temples and the external surfaces of pylons and walls were converted into large grouped pictures, deeply incised, and with flat tints, graded according to the light, being delicate in the well-illuminated parts, heavier in the darker apartments. See **EGYPTIAN ART**.

ASIA. Babylonia and Assyria had greater variety of method. The walls were often divided horizontally into zones—a lower dado of sculpture, an upper one of painting. The sculpture was either of fine stone partly colored (not entirely, as in Egypt), or of glazed tiles in relief, strongly colored. Though the tones were still flat, more relief was given than in Egypt by the accentuation of outlines and details by heavy dark lines. Gold and other metals and rich hangings increased the strength of the color scheme. The exterior walls were often faced with flat glazed tiles in massed colors, with the same result. See **BABYLONIAN ART** and **ASSYRIAN ART**.

GREECE. The pre-Hellenic Greeks seem to have used gypsum and plaster reliefs and wall paintings in similar fashion to the Assyrians, and the Greeks of the historic period at first show signs of Oriental influence in the violent colors applied to gable, frieze, and metope sculptures, without the Oriental appreciation of color harmony. The polychromy of Greek architecture and sculpture gradually, however, gave way to the use of plain sculpture and to a reliance on the play of light and shade by means of projecting moldings and members in place of pure surface decoration. Simplicity of method, reticence of style, plasticity of composition, and delicacy of coloring were their characteristics. Color was subordinated to form, and the decorated surfaces were broken up usually into small units. The predominance of external over internal effects helped to minimize the importance of Greek mural decoration.

ROME. The Romans returned, with different methods and a different style, to the Oriental and Egyptian idea of colored instead of plastic mural adornment, which received great importance from their development of vast interiors. They adopted three principal media, with increasing heaviness as the Empire advanced—wall painting in fresco, mosaic painting, and marble incrustations. The molding of decorations in low relief in the stucco covering of walls and ceilings may be considered chiefly as an adjunct to the painted decoration. The most characteristic of these three treatments was the use of rich Oriental and African marbles. The interior walls of temples, Imperial thermæ and palaces, basilicas, and other buildings were covered to a

considerable height in this way, while private houses were generally confined to fresco work. (See Plate of Pompeian Mural Decoration, under DECORATIVE ART.) Mural decoration on stucco was often microscopic in scale, small compartments, and small scenes being juxtaposed without much central interest, and by attempts at perspective effects and different planes the effort was made to counteract the confining effect of the walls of a room; to substitute pictures one could look into for flat decorated surfaces. See ROMAN ART.

EARLY CHRISTIAN. In early Christian and Byzantine mural decoration one school adopted as its main medium the new method of mosaic wall pictures (see MOSAIC), which gave a richer mural color scheme than had ever been known in any style. Casting aside the Roman picturesqueness, this school returned to the Oriental flat effects; but with the addition of glowing gold grounds and the depth given by the colored glass cubes an entire wall often became a single picture instead of an agglomeration of units. The advantage of Byzantine decoration was that the eye was received by and sank into its rich mosaic surfaces instead of being thrown back by shallow fresco coloring. The other school preferred plain or frescoed surfaces; this treatment was common in most of Syria, Asia Minor, North Africa, and Europe. Mural decoration in these regions for long after the decline of Rome was practically extinct where Byzantine influence did not exist. Even in Byzantine art fresco painting tended in many places to displace mosaic. See CHRISTIAN ART; BYZANTINE ART.

MOHAMMEDAN. The earliest special development of mediæval decoration was in the Mohammedan world, and it was one of great interest. It used color very generously, but also sculpture in low relief; its effects were mainly those of tapestry and other stuffs, even when design was in the form of colorless carvings on the outside surface of a dome. Geometric patterns were most prominent; floral forms, and very rarely human figures, characterize Persian art. Glazed tiles were specialties in Persia, geometric mosaics in Egypt, colored stuccoes in Spain. There was but little composition, grouping, or subdivision; the main plan was to cover the surfaces completely with more or less uniformity. There were practically no plain surfaces and no heavy projections. Such necessary projections as pendentives were broken up into minute stalactites. The effects were rich and restful, often even hypnotic. The Oriental races always retained the faculty of harmonious coloring, and used it to the full in mural decoration. Though related to the Byzantine type, this style was far more intricate and less well composed. See MOHAMMEDAN ART.

MEDIÆVAL. The mediæval decorative mural work in Europe did not begin to take shape until the close of the eleventh century; its usual media were extremely simple, merely fresco painting and sculpture in stone. The multiplicity of styles makes any unity of characterization such as was possible in other previous styles, quite impossible. In some parts of Europe there was practically no attempt at mural decoration till the Gothic period, as in parts of Germany and England. In Central and Southern France the entire exterior façades were often compositions in sculpture; in Tuscany and Northern Italy effects of color on the exterior were given by the use of

marbles, terra-cotta, and brickwork in patterns or courses. In certain regions, such as Sicily, Rome, and Venice, the Byzantine and Oriental rich color scheme, especially in the form of mosaic work, prevailed. (See ROMANESQUE ART.) When, however, European art became thoroughly nationalized and indigenous in the Gothic period, Italy took a decided lead in the development of painted mural decoration in fresco which superseded all other methods. The reason for this was that the more logical Gothic art of the North, under French leadership, practically suppressed wall surfaces, and consequently mural decoration, in favor of detached ornamentation in stone, stained glass, and the like, due to the framework system of Gothic architecture. Italy, almost alone, did not abolish wall surfaces; consequently her painters, like Cimabue and Giotto and their contemporaries and successors, could develop the primitive fresco-work of the Romanesque type into a really artistic scheme of mural decoration such as we see at Assisi, Florence, and Siena. Grand figured compositions, harmoniously grouped, were the characteristic of this Italian school. Rich borders sometimes followed, sometimes contrasted with the architectural lines. Above all the coloring was light and clear and the effects flat and symbolic, the figures being rather like silhouettes on a flat ground. (See GOTHIC ART.) Sometimes there were also grand exterior effects both of color and form, as at Orvieto.

RENAISSANCE. The Renaissance saw Italy still easily leading in mural decoration from Masaccio to Raphael; the media were even simpler than before, for mosaics were entirely discarded and effects of sculpture and architectural memberment less frequent. The climax in the Sistine Chapel and Raphael's Stanze was reached by a perfectly consistent series of steps, some advantageous, such as the abandonment of the heavy architectural frameworks of the Giottesque period for simpler borders; some were disadvantageous, such as the attempts to do away with flat effects by the introduction of perspective and a variety of planes in both environment and figures. The juggling with perspective and anatomical difficulties indulged in during the fifteenth century by Paolo Uccello, Melozzo, and Mantegna led, in later days, to the extravagances of Correggio, Paolo Veronese, and Tiepolo. It became the main object of painters of the sixteenth century to change the subdivisions of flat mural decoration into a series of realistic framed vistas, and this mistaken realism was emphasized by the use of oil instead of fresco colors, giving effects of atmospheric perspective besides the previously acquired linear perspective. See RENAISSANCE ART.

MODERN. During the first half of the nineteenth century mural decoration declined to very low estate. In France, however, the influence of the national school of fine arts and the Government patronage of the arts preserved it from extinction, and the domination of classicism and tradition began toward 1840 to yield to a new and fresher spirit, exemplified in the works of Hippolyte Flandrin. The decorative sense is more highly developed in France than elsewhere, and there has risen in France a remarkable school of mural painting, whose influence has been felt throughout the modern world. Modern French decorative painting rejects the

flatness and conventional composition of the Italian fourteenth-century artists, inclining rather to the pictorial realism of the developed Renaissance schools; but it recognizes the difference between an easel picture applied to a wall or ceiling, and a decorative painting composed specially for an architectural setting. Paul Baudry (Grand Opera) and the late Puvis de Chavannes (Panthéon) are the most noted exponents of this school; but J. P. Laurens, O. Merson, Galland, and others stand high in this art; and all French public buildings are rich in the works of such men.

While Germany did much early in the century to study and revive mural painting, classical tradition tended to stifle originality, and no really great masters of the art have appeared. Cornelius (1783-1867) and Kaulbach (1805-74) made efforts to revive monumental mural painting, especially at Munich and Berlin, but their works lack the real decorative spirit. In England there is almost nothing to show in the way of mural painting, the preference there being usually for decoration by architectonic means and conventional ornament. In Spain the eccentric but powerful genius of Goya (1746-1828) asserted itself in the first third of the last century in ceiling paintings of great merit in Madrid, but he had no successors, and Spain and Italy are equally in arrears in this branch of art. Until lately the same was true of the United States, but recent progress in American art has in nothing been more noteworthy than in the rapid advance of skill in mural painting. This has been stimulated by the influence of the Chicago Columbian Exhibition and others. Many great public buildings recently erected have been adorned with mural paintings by first-rate artists (e.g. Boston Public Library, Congressional Library of Washington, Appellate Court and Mendelssohn Concert Hall at New York, etc.); and American artists, though generally trained in France, have shown independence and originality. Among the leaders in this revival may be named W. M. Hunt, Maynard, Kenyon Cox, Blashfield, Blum, Abbey, and Sargent.

Modern mural decoration has generally abandoned fresco painting in favor of oil painting on canvas, attached to the wall with white lead. Fresco, tempera, encaustic, and water-glass painting are rarely attempted. Other forms of decoration have been revived and are largely used, wainscoting, marble incrustation, mosaic, and inlay and stucco relief, and wall-hangings in paper, tapestry, stamped leather, and other materials, besides other more purely architectonic methods of adornment, being widely used and with conspicuous success.

BIBLIOGRAPHY. No special works have been written upon the general subject, except practical manuals for the use of painters, such as Thomas, *Mural Decorations* (London, 1869); Crowninshield, *Mural Painting* (Boston, 1887). Consult also the bibliographies of **MOSAIC** and the other articles referred to.

MURANO, mŭr-ă'nô. A town in the Province of Venice, Italy, on an island, one and a half miles north of Venice. It has the Cathedral of San Donato, completed in the tenth century, the Basilica of San Pietro Martire, and a museum with exhibits of glass products. The town has been, since the thirteenth century, the

seat of the Venetian glass industry. Population (commune), in 1881, 3629; in 1901, 5150.

MURAT, mŭ'ră', JOACHIM (1767-1815). A celebrated French cavalry leader, King of Naples from 1808 to 1815. He was born March 25, 1767, being the son of a well-to-do innkeeper at La-Bastide-Fortunière, near Cahors, in France. He was intended for the priesthood and commenced the study of theology and canon law at Toulouse, but soon enlisted in a cavalry regiment. Being dismissed for insubordination after two years of service, he returned to his home, and later proceeded to Paris, where he obtained admission into the constitutional guard of Louis XVI. through the good offices of a friendly Deputy, M. Cavignac. On the outbreak of the Revolution he was made a sub-lieutenant in a cavalry regiment, and a little later aide-de-camp to General Hué. His gallantry and his extreme Republicanism soon won him the rank of colonel. He attached himself closely to Bonaparte in 1795-96, and later served under him in Italy and in Egypt, signalizing himself in many battles. He finally rose to be general of division (1799), and having returned with Bonaparte from Egypt to France, he rendered most important assistance on the 18th of Brumaire, by dispersing the Council of Five Hundred at Saint Cloud. Bonaparte now intrusted him with the command of the Consular Guard, and gave him his youngest sister, Caroline, in marriage (January 20, 1800). The same year Murat commanded the cavalry at Marengo, and expelled the Neapolitans from the Papal States. In 1803 he was a member of the *Corps Législatif*, and in 1804 Governor of Paris. On the establishment of the Empire he was loaded with honors, being made a marshal of the Empire (1804), and a prince and Grand Admiral (1805). He continued to command the cavalry in the armies led by the Emperor, contributed to the triumph of the French at Austerlitz, and to other victories. In 1806 the newly erected Grand Duchy of Berg (q.v.) was bestowed upon him. After the battle of Jena, in 1806, he led in the pursuit of the Prussians, and in 1807 he participated in the battles of Eylau and Friedland. In 1808 Napoleon placed him in command of the army in Spain, where in May he suppressed the insurrection in Madrid. Joseph Bonaparte having exchanged the throne of Naples for that of Spain, Murat was made his successor, and on August 1, 1808, was proclaimed King of Naples under the title of Joachim I. Napoleon. He immediately took possession of the Kingdom of Naples, but the Bourbons, through the support of Great Britain, retained Sicily. Murat instituted a number of wise and beneficent reforms, but had to endure the yoke of Napoleon, who left him little but the outward show of royalty. In the Russian campaign of 1812 he commanded the cavalry, but after sharing in the disaster which befell the French army returned to Naples anxious and discontented. He joined the French army again in 1813, and distinguished himself at Dresden, but after the battle of Leipzig withdrew to his own dominions and concluded a treaty with Great Britain and Austria in January, 1814, by which he was guaranteed the possession of his throne on condition of joining the coalition against Napoleon and contributing 30,000 troops to the allied armies. After a pretense of attacking Eugène Beauharnais in Italy, Murat

withdrew to Naples and entered into private communications with Napoleon at Elba. On the Emperor's return to France, Murat placed himself at the head of an army of 40,000 men and commenced a war against Austria. He was defeated by the Austrians at Tolentino, May 2d-3d. Naples was evacuated May 19th, and Murat fled to the island of Ischia, and finally found his way to France, while his wife and children took refuge with the British fleet. Napoleon declined to treat with his brother-in-law on any terms and forbade his presence in Paris. Murat then found a refuge near London, and after Waterloo he fled to Corsica. Declining Metternich's offer of an asylum in Austria, he proceeded in a foolhardy manner with a few followers to the coast of Naples and proclaimed himself King and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the Castle of Pizzo, October 13, 1815.

Consult: Helfert, *Joachim Murat, seine letzten Kämpfe und sein Ende* (Vienna, 1878); Gallois, *Histoire de Joachim Murat* (Paris, 1838); Guardione, *Gioachimo Murat in Italia* (Palermo, 1899). See NAPOLEON I.

MURAT, NAPOLÉON ACHILLE (1801-47). Eldest son of Joachim Murat, King of Naples. He was born in Paris, and for a time bore the title of the Prince Royal of the Two Sicilies; but after the overthrow of his father, in 1815, he sought refuge with his mother in Lower Austria, where he received an excellent education. In 1821 he emigrated to the United States, and after a tour of the country settled near Tallahassee, Fla., where he bought a large estate and built an elegant mansion. When Lafayette revisited the United States in 1825, Murat traveled much with him, and was by him introduced to a grandniece of Washington, Miss Catharina Dudley, whom he married in 1826. Murat declined numerous offers of a political career, and devoted himself to farming, literary pursuits, and philanthropic undertakings. His literary works include: *Lettres d'un citoyen des Etats-Unis à un de ses amis d'Europe* (1830); *Esquisse morale et politique des Etats-Unis* (1832); *Exposition des principes du gouvernement républicain tel qu'il a été perfectionné en Amérique* (1833). These works attracted great attention in Europe. Consult MacConnell, "The Prince and Princess Achille Murat in Florida," in the *Century Magazine* (1893).

MURAT, NAPOLÉON LUCIEN CHARLES (1803-78). The second son of Joachim Murat, King of Naples. He was born in Milan, and after the overthrow of his father in 1815 lived for several years with his mother in Lower Austria. He went to Boston in 1825, and soon after his arrival in the United States he joined his uncle Joseph, who was then living in Philadelphia under the title of the Count of Surveilliers. In 1827 he married Miss Frazer, an heiress, of Bordentown, N. J. His wife later established there a fashionable school for young women. Unlike his brother, Napoléon Achille, he did not give up the idea of recovering his father's throne, and in 1839 and 1844 made trips to France with that purpose in view, but was permitted to remain in France only a short time. After the February Revolution of 1848 he returned to France and was elected a Deputy to the Constituent Assembly. He

was Minister Plenipotentiary to Turin in 1849-50. After the coup d'état of December 2, 1851, he received a seat in the Senate, and was recognized by Napoleon III. as a prince of the Imperial family, which brought to him an annual pension of 150,000 francs and secured the payment of two millions of debts. In 1861 he advanced claims to the throne of Naples, but his pretensions were officially disavowed by the French Government and came to naught.

MURATORI, mō'rā-tō'rē, LODOVICO ANTONIO (1672-1750). A celebrated Italian antiquary and historian. He was born at Vignola, near Modena, October 21, 1672. He studied theology and history in the University of Modena, and early attracted the attention and won the friendship of Father Bacchini, the librarian at the ducal palace, who fostered in him a taste for historical and antiquarian research. In 1688 Muratori took minor orders, and in 1694 obtained the degree of doctor in canon and civil law. The same year he was appointed to the staff of the Ambrosian Library at Milan. While there he published his two collections of previously unedited Greek and Latin fragments entitled *Anecdota Græca* and *Anecdota Latina*. In 1700 he returned to Modena at the invitation of the Duke, in order to become keeper of the ducal archives and librarian of the Este Library, Father Bacchini having resigned this last post. For fifty years Muratori toiled unceasingly, collecting and editing mediæval chronicles and Italian historical records. His enemies, chiefly the Jesuits, accused him of publishing and teaching heretical doctrines; but, appealing to Pope Benedict XIV., the learned antiquary and historian received full protection against such attacks. He was one of the foremost scholars of his day and had a European reputation. He died on January 23, 1750. His works fill forty-six folio volumes, the most important ones being as follows: *Rerum Italicarum Scriptores* (25 vols., 1723-51), the standard collection of documents relating to Italian history; *Antiquitates Italicæ Mediævæ* (6 vols., 1738-42); *Annali d'Italia* (12 vols., 1744-49); and *Antichità estensi* (2 vols., 1717-40). Consult the biography by his nephew, G. F. Muratori, *Vita del celebre Lodovico Antonio Muratori* (Venice, 1756); Troya, *Studi intorno agli annali d'Italia del Muratori* (Naples, 1877; new ed. 1901 et seq.).

MURATORIAN FRAGMENT, or CANON OF MURATORI. A fragment of a treatise upon the Bible canon commenting upon the several books and so giving a very important list of the books accepted as canonical at the time of its composition, which probably was the latter half of the second century. In the list are the Gospel of Luke, which it calls the third (the fragment begins at this point, so doubtless Matthew and Mark had been mentioned in the part now lost); John, Acts, the Epistles of Paul to the Corinthians, Ephesians, Philippians, Colossians, Galatians, Thessalonians, Romans, Philemon, Titus, and Timothy; Revelation of John; Jude; two Epistles of John; Wisdom of Solomon; and, as doubtful, the Revelation of Peter, but omits the Epistles of James and of Peter and the Epistle to the Hebrews. The fragment was discovered in the Ambrosian library at Milan (1740) by Lodovico Antonio Muratori (q.v.), from whom

it receives its name. It is translated in the *Ante-Nicene Fathers*, vol. v.

MURAVIEFF, мур'а-вьѣф'. An ancient and distinguished Russian family, originally of Moscow, which in 1488 was presented by Czar Ivan Vasilievitch I. with large estates in the Province of Novgorod. The best known members of the family are: MIKHAIL NIKITITCH (1757-1807). Catharine II. made him the tutor of her grandchildren, Alexander and Konstantin, for whom he composed works in prose and poetry, which are still classics in Russian literature. He also occupied various important administrative posts. His works were published in three volumes (Moscow, 1810).—NIKOLAI NIKOLAEVITCH (1768-1840). He studied at Strassburg, and thereafter served for some time in the army and navy. In 1797 he founded a private institution for officers of the general staff. During the war of 1812-14 against Napoleon he served as colonel. His school became a State institution in 1816, and he continued to superintend it until 1823, after which he devoted himself to agriculture.—ALEXANDER NIKOLAEVITCH (1792-1864). He was the eldest son of the preceding, and was prominent in the Decembrist uprising, which broke out in 1825 at the accession of Nicholas I. In consideration of his father's services his life was spared and he was exiled to Siberia. Later he was permitted to return, and during the Crimean War he entered the army and became a major-general.—NIKOLAI NIKOLAEVITCH (c.1794-1866). The brother of the preceding. He entered the army in 1810 and took part in the campaigns of 1812-14 against the French. After the end of the war he remained in the army, and traveled extensively in Asia. He served during the Persian War and was made a major-general. In 1830 the Polish Rebellion broke out, and Muravieff was called in to aid in suppressing the revolt. In 1832 he was sent to Egypt to treat with Mehemet Ali for the conclusion of peace with Turkey. He then took charge of the Russian forces dispatched to the Bosphorus to aid the Sultan against Mehemet Ali. In 1838 he fell into disgrace and retired from the army, remaining inactive until 1848. During the Crimean War he rendered valuable service to Russia in the Caucasus. The capture of Kars, in November, 1855, earned for Muravieff the title of prince and other great honors.—MIKHAIL NIKOLAEVITCH (c.1796-1866). A brother of the preceding. He entered the army and participated in the campaigns against France of 1812-13. He occupied many important administrative positions, and opposed vehemently the emancipation of the serfs. During the Polish Rebellion of 1863 he was sent to Vilna, and acted with such relentless rigor that in a few months the entire insurrection was suppressed. His acts of cruelty made his name infamous throughout Europe.—MIKHAIL NIKOLAEVITCH, Count (1845-1900). A grandson of the preceding. He was born April 19, 1845, studied in Heidelberg, and in 1864 entered the service of the Ministry of Foreign Affairs. He was attached to various Russian embassies in Europe, and on the death of Prince Lobanoff in 1897 he became Minister of Foreign Affairs. He advanced Russian interests in the Far East and put forth the Czar's note for the Hague Peace Conference in 1898. He died June 21, 1900.

About 1730 a member of the Muravieff family married a daughter of Apostol, the Ataman of the Cossacks, whose name was added to his own.

Of this branch of the family the best known is SERGEI MURAVIEFF-APOSTOL (1796-1826). He participated in the Decembrist uprising of 1825; proclaimed Grand Duke Konstantin as Emperor, and seized the town of Vasilkov. Troops were sent against him and he was captured, taken to Saint Petersburg, and hanged July 25, 1826.

NIKOLAI NIKOLAEVITCH, Count (c.1809-81), belonged to another branch of this family. He entered the army while young, and served in the Caucasus, where he attained the rank of major-general. In 1848 he was appointed Governor-General of Eastern Siberia, and gained for Russia the entire territory of the Amur, and concluded the Treaty of Aigun, May 28, 1858, by which this country was definitely ceded by China. His services were rewarded by the title of Count, and he received the name Amurski. In the summer of 1859 he went with twelve ships to Yedo, and concluded a favorable treaty with Japan. He resigned his Governorship in 1861, and was made a member of the Imperial Council.

MURCHISON, mŭr'ch-i-son, CHARLES (1830-79). A Scotch physician, born in the island of Jamaica. He was educated at the universities of Aberdeen, Edinburgh, Dublin, and Paris. In 1853 he entered the East India Company's military service, but soon after reaching India was appointed professor of chemistry at the Calcutta Medical College. In 1855 he published two valuable papers on *The Climate and Diseases of Burma*. The same year he returned to Europe, and settled in London, where he was connected with a number of the leading hospitals. He published the important *Treatise on the Continued Fevers of Great Britain* (1862).

MURCHISON, Sir RODERICK IMPEY (1792-1871). A British geologist, born in Tarradale, Ross. After studying at the military college of Marlow, he entered the army and served as an officer in the Peninsular War under Wellington. Through the advice of Sir Humphry Davy he was induced to take up the study of science, and in 1825 became a fellow of the Geological Society of London, before which he read a paper entitled "Geological Sketch of the Northwestern Extremity of Sussex and the Adjoining Parts of Hants and Surrey." Returning from a geological tour through France, which he made in the company of Sir Charles Lyell, he undertook a systematic exploration and study of the lower fossiliferous strata of England and Wales. This work engaged his attention for many years and resulted in a reclassification of the Paleozoic rocks, with the introduction of a new system to which, in 1835, he gave the name Silurian. He was soon after employed by Emperor Nicholas in a geological survey of Russia, being associated with De Verneuil and Keyserling; during the years 1840-44 he explored a large part of Southern Russia and introduced a second new system—the Permian—into the geological time scale. From his knowledge of the geological structure of the Ural Mountains and the Australian systems, he was led to believe that gold occurred in the latter, and as early as 1844 predicted its discovery. Murchison was elected president of the British Association for the Advancement of Science in 1846, president of the Royal Geographical Society in 1844, 1845, and 1857, and in 1855, upon the death of Sir H. T. De la Beche,

became director of the British Geological Survey. He was knighted in 1846, made Knight Commander of the Bath in 1853, and a baronet in 1863. From the Emperor of Russia he received the grand cross of Saint Anna and that of Saint Stanislas. The greater portion of his contributions to science were published in the society journals. Among his principal works are: *Geology of Cheltenham* (1834); *The Silurian System* (1839); *On the Geological Structure of the Northern and Central Regions of Russia in Europe* (1841); and *Geology of Russia in Europe and the Ural Mountains* (1845). Consult Geikie, *Life of Sir Roderick I. Murchison* (London, 1875).

MURCHISONIA (Neo-Lat., named in honor of Sir R. I. Murchison). An extinct gastropod of the family Pleurotomariidae, found in rocks of Ordovician to Triassic age, and especially common in the Devonian and Carboniferous formations. The shell has a more or less pointed spire consisting of numerous coils or whorls. The aperture has in its outer lip a slit like that of Pleurotomaria, and a corresponding slit-band that forms a more or less pronounced ridge on the outside of the whorls all the way from the aperture to the apex of the shell. The earlier species as a rule have smooth surfaced shells; the later species are more frequently ornamented by nodes and transverse ridges. A subgenus, *Hormotoma*, with rounded whorls, is represented by *Murchisonia gracilis*, a very common species in the Trenton limestone of the United States and Canada. *Loxoplocus*, another very peculiar genus, with the coils of the spire unrolled and somewhat carinate in section, lived in the cavities of the corals that made up the Guelph beds of Canada and western New York. See PLEUROTOMARIA.

MURCIA, *mūr'thā*. A former division and an old Moorish kingdom of Spain, situated in the southeastern part of the country, and bounded on the north by New Castile, on the east by the former Kingdom of Valencia, on the south by the Mediterranean Sea, and on the west by the former kingdoms of Granada and Jaén and by New Castile (Map: Spain, E 4). The division comprised the modern Province of Murcia, the greater part of Albacete, and small portions of Jaén and Alicante, with a total area of about 10,000 square miles.

The surface of Murcia partakes of the general character of the whole peninsula—the interior plateau, the rapid and mountainous slope toward the sea, and the low coastal region. The last is a sandy semi-arid belt from 10 to 20 miles wide, and broken by several coast lagoons, of which the Mar Menor is the largest. The mountainous belt occupies the greater part of the division, and consists of an irregular system of ranges whose nucleus and highest point is the Sierra de Espuña, with an altitude of 5193 feet. North of the mountains the interior plateau forms a part of La Mancha (q.v.), a deforested and almost arid plain. The principal water system is the Segura River with its tributaries, which are used only for irrigation, and are subject to great variations in volume, being at some seasons almost dry, and at other times subject to disastrous inundations. The climate is subtropical near the coast and temperate on the slopes and plateaus. The winters are mild, the sky nearly always clear, and the climate is pleasant and healthful; but the rainfall is insuff-

VOL. XIV.—13.

ficient for the needs of agriculture. The whole region has been almost entirely deforested, and agriculture can be carried on only in the valleys by means of irrigation. Many of the valleys, however, are well cultivated, especially the Huerta or 'Garden' of Murcia, which is one of the most beautiful places in Spain. The chief agricultural products are wheat, barley, and flax. Oranges, lemons, olives, grapes, and hemp are grown in the south. Mining is an important industry, producing iron, lead, zinc, copper, and sulphur. The production of zinc has increased fourfold within the last ten years, being 46,000 tons in 1900. The output of iron has decreased from 430,000 tons in 1890 to 370,000 tons in 1900. Other industries are silk manufactures and the plaiting of articles of esparto grass. The population in 1887 was 708,828, and in 1900, 815,864. The chief city is Murcia (q.v.).

Murcia was the centre of the Carthaginian colonies in Spain. It was conquered by the Saracens early in the eighth century and by them called Todmir. It formed a province of the Caliphate of Cordova, after whose dissolution, in the early part of the eleventh century, it became an independent Moorish kingdom. About the middle of the thirteenth century it was conquered by Castile.

MURCIA. The capital of the Province of Murcia, in Southeastern Spain. It lies on both banks of the Segura River, in the beautiful valley known as the Huerta or 'Garden' of Murcia (Map: Spain, E 4). This valley rivals in the luxuriance of its vegetation the famous Vega of Granada. It was carefully irrigated by the Moors, and is covered with vineyards and groves of mulberry, olive, and fig trees. The city itself has narrow streets, but a clean and generally neat appearance. Several promenades and pleasure grounds have been laid out along the embankments of the river, and the Paseo de Florida-blanca is a wide avenue with fine rows of plane trees. Though the city still retains some of its old Moorish atmosphere, it has preserved but few objects of interest. The only building which attracts considerable notice is the cathedral, a Gothic-Romanesque structure begun in the fourteenth century. Its façade in the baroque style dates from the eighteenth century, and its tower, the most interesting feature, was begun in 1522 and completed in 1766. Other prominent buildings are the imposing bishop's palace, the city hall, with a monumental façade, the Colegio de San Fulgencio, two theatres, a bull ring, and the large and well-built silk factories. There are a provincial museum, two normal schools, and a secondary school. The industries are largely derived from the surrounding huerta, the chief being the silk industry, which, with grain and fruit, furnishes the principal articles of trade. There are also manufactures of woollen goods, gunpowder, soap, leather, hats, and musical instruments. The population in 1887 was 98,538, and in 1900, 111,693.

MURDER (AS. *mōrþor*, *mōrþur*, from *mōrþ*, OHG. *mord*, Ger. *Mord*, death; connected with Welsh *marw*, Lith. *smertis*, Lat. *mors*, death, Gk. *spōrōs*, *brotos*, mortal, Skt. *mar*, to die). The unlawful killing of a human being with malice aforethought. The term appears to have been limited in early English law to a homicide committed in secret, or accompanied by concealment

of the body. During the Norman period, this *morth* (or secret) slaying of Saxon times became the *murdrum*—the homicide of the very worst kind, and was distinguished by Glanville from a mere *homicidium*, or open killing. For a considerable time, *murdrum* signified the fine imposed by the Crown on any hundred in which a man was slain, as well as the killing itself. This fine—originally 46 marks, of which 40 went to the King and 6 to the kinsfolk of the deceased—could be avoided by the production of the slayer, or by proof that the slain man was an Englishman and not of Franco-Norman race. Furnishing such proof was known as Englishry. From the time that Englishry was abolished in 1348, murder bears the single meaning of unlawful homicide of the worst species, which subjects the slayer to capital punishment.

The next step in the history of murder as a term of English law, according to the best authorities, "consists in the adoption of the expression 'malice aforethought,' as the characteristic specific distinction of murder as distinguished from other kinds of homicide." This came about from the forms of the special findings of the jury in prosecutions for homicide. In order to entitle the slayer to a pardon under the Statute of Gloucester (6 Ed. I., c. 9, A.D. 1278), it was necessary for the jury to find that he acted "in self-defense and not by felony or of malice aforethought." During the next two centuries and a half, the modern distinction between willful murder and manslaughter (q.v.) was developed, as appears by a statute of 1531 (23 H. VIII., c. 1, § 3), which takes away the benefit of clergy (q.v.) in cases of "willful murder of malice prepense." The first element in the crime is unlawfulness, as distinguished from the killing which is justifiable or excusable homicide. (See HOMICIDE and JUSTIFIABLE HOMICIDE.) Not only must the killing be unlawful, but the person killed must be a "reasonable creature in being." Accordingly, the killing of an unborn child is not murder at common law, but is abortion (q.v.).

The other essential element in murder is the malice aforethought with which the killing is done. This requires, first of all, sanity and discretion on the part of the slayer. An idiot, a lunatic (q.v.), or an infant (q.v.) below the age of discretion cannot commit murder. While malice aforethought is essential to the crime of murder, the law does not require the lapse of any prescribed time between the formation of the intention to kill and the killing. It is sufficient that the murderous intention precedes and accompanies the act of homicide. If the will accompanies the act a moment antecedent to the act itself which causes death, this makes the offense murder as certainly as if a day intervened between the willing and the doing. The malice in case of murder must be actual, or, as it is sometimes said, express, in contradistinction to implied malice. This does not mean, however, that the slayer must actually have intended to kill his victim, nor that he bore toward him a settled and malignant ill-will. Hence if one shoots at A, and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. In short, the idea

of malice aforethought is not spite or malevolence to the deceased in particular, but evil design in general; not premeditated personal hatred or revenge toward the person killed, so much as a deliberately unlawful purpose which, if persevered in, must produce mischief. At the common law the procuring of a person to commit suicide (q.v.) is murder if the suicide is accomplished. So it is said in the books that if two persons agree to commit suicide, and attempt to carry their design into execution, but only one dies, the survivor is guilty of murder if he were present at the commission of the suicide; otherwise he is an accessory before the fact.

The common law knew nothing of degrees of murder. If the homicide was committed unlawfully and with malice aforethought, the slayer was a murderer, and, upon conviction, liable to capital punishment. This penalty has been thought too severe for some kinds of murder, and a number of our States have divided the offense into two degrees, continuing capital punishment for the first degree, and punishing the second degree with imprisonment. While these statutes differ in detail, they agree in limiting the definition of murder in the first degree to those cases where the killing was done in a willful, deliberate, premeditated, or particularly cruel manner, or while engaged in the commission of some heinous felony, such as arson, and in some States rape and burglary. Consult: Bishop, *New Criminal Law* (Chicago, 1892); Stephen, *History of the Criminal Law of England* (London, 1883); Wharton, *Criminal Law* (Philadelphia, 1896); Clark and Marshall, *Law of Crimes* (Saint Paul, 1900); and authorities referred to under CRIMINAL LAW.

MURDERS IN THE RUE MORGUE, THE. A tale by Edgar A. Poe, which appeared in *Graham's Magazine* in 1841, and became a model for later detective stories. The story opens with newspaper accounts of a horrible murder in Paris of an old lady and her daughter. The writer and a friend visit the house, and the friend ascertains from the appearance of the room that the murderer was an orang-outang escaped from its keeper.

MURDOCK, JAMES EDWARD (1811-93). An American actor, born in Philadelphia. His first appearance on the stage was in his native city in 1829. In 1833 he acted with Fanny Kemble during her tour in America, and in 1856 played with some success at the Haymarket Theatre in London. During the Civil War in America he devoted himself to caring for sick and wounded soldiers, and gave popular readings for the benefit of the United States Sanitary Commission. Subsequently he was professor of elocution in the Cincinnati College of Music. Joseph Jefferson characterizes his acting as "not only extremely versatile, but entirely original." His greatest successes were in comedy and lighter tragedy. With William Russell he published *Orthophony, or Culture of the Voice* (1845); and *The Stage* (1880).

MURDOCK, JAMES (1776-1856). An American scholar, born in Westbrook, Conn., and educated at Yale, class of 1797. He taught school in New Haven and at Oneida Academy, now Hamilton College, studied for the ministry, was licensed in 1801, preached for thirteen years in the Congregational Church of Princeton, Mass.,

and was professor of ancient languages in the University of Vermont from 1815 until 1819, when he went to Andover Theological Seminary. There he taught sacred rhetoric and Church history until 1829, and then he removed to New Haven, where he devoted his last years to private study. He wrote versions of Munscher's *Elements of Dogmatic History* (1830), of Mosheim's *Institutes of Ecclesiastical History* (1832), and of Mosheim's *Affairs of the Christians Before the Time of Constantine the Great* (1852), a *Literal Translation of the Whole New Testament from the Ancient Syriac Version* (1851), and *Sketches of Modern Philosophy* (1842).

MURDOCK, WILLIAM (1754-1839). An English engineer, who was the first to employ coal gas as an illuminant. He was born at Bellow Mill, in Ayrshire. In 1784 he had begun to experiment on a high pressure locomotive. From these unsuccessful attempts, about 1792 he turned his attention to lighting by coal gas. (See GAS, ILLUMINATING.) The actual perfection of the invention was probably two or three years afterwards, and in 1802 gas was used in the illumination of Soho, after the news of the Peace of Amiens. Murdock made several improvements on Watt's steam-engine and invented an independent or 'ball-crank' engine and various apparatus by which compressed air might be used.

MURE, Sir WILLIAM (1594-1657). A Scottish poet, born probably in Ayrshire, where the Rowallan estate, which he inherited, was situated. In 1643 he was a member of Parliament in Edinburgh, and he was wounded the next year at Marston Moor. His principal effort is his clever but somewhat heavy *True Crucifixæ for True Catholics*, which appeared in 1629. His other writings are a poetical translation (1628) of *Heccatombe Christiana*, a Latin poem by Boyd of Trochrig, many miscellaneous poems, and a paraphrase of the Psalms (1630).

MURE, mŭr, WILLIAM (1799-1860). An English classical scholar, born at Caldwell, Ayrshire, Scotland. After studying at Westminster School and at Edinburgh, he spent several years at the University of Bonn. His chief work, *A Critical History of the Language and Literature of Ancient Greece* (5 vols., 1850-57), was left unfinished, but the several portions of it on the epic and lyric poets and the historians may be regarded as separate works. His attempt in the first two volumes to prove the essential unity of the *Iliad* and *Odyssey*, and the identity of their authorship, won him a wide reputation among European scholars. In addition to numerous contributions to the *Edinburgh Review*, his publications include: *Brief Remarks on the Chronology of the Egyptian Dynasties* (1829); *A Dissertation on the Calendar and Zodiac of Ancient Egypt* (1832); and his *Journal of a Tour in Greece and the Ionian Islands* (1842). He sat in Parliament for Renfrewshire in 1846-55, and was lord rector of the University of Glasgow in 1847-48.

MURET, mŭ'râ', or MURETUS, MARC ANTOINE (1526-85). A French humanist. He was born at Muret, became a proficient scholar in Greek and Latin, and when but eighteen lectured in the College of Auch. At the invitation of Cardinal Ippolito d'Este, he took up his residence in Rome, where he won fame by his lectures. He took orders in 1576 and in 1584 re-

tired from his professoriate. He wrote *Orationes* and *Epistolæ*, and his *Variorum Lectionum Libri XIX* is still valuable. His reputation rests chiefly, however, upon the classic Latinity of his style. The best edition of his collected works is that of Frotcher and Koch (Leipzig, 1834-41).

MUREX (Lat., purple-fish). A genus of tropical shells, large, heavy, and variously armed with stout spines, processes, or knobs. These are to protect and strengthen the shells, for the animals live on exposed coasts. One species (*Murex pomum*) is found along the American coast from Cape Hatteras to Texas. It is from two to three inches in length, but not so conspicuously spiny as some more tropical forms. Allied to Murex is the oyster-drill (*Urosalpinx cinerea*), which bores into oyster shells by means of its lingual ribbon. (See DRILL.) *Murex fortispina* of New Caledonia is furnished with a powerful tooth at the lower part of its outer lip. Its favorite food is *Arca pilosa*, a species of bivalve allied to the 'Noah's ark' (see ARK SHELL), which lives half buried in coral refuse. Many of the tropical species are gayly colored, and some yield, when the animal is crushed, a rich violet-purple liquid which will act as a permanent stain, and which furnished to the ancients their 'royal-purple' dyes. Other shells yield this or a similar color. See PURPLE-SHELL; also Colored Plate of GASTROPODS.

MUREXID (from Lat. *murex*, purple-fish), PURPURATE OF AMMONIA, or ROMAN PURPLE, $C_8H_8N_2O_6 \cdot NH_3 + H_2O$. A beautiful coloring matter similar to the Tyrian purple of the ancients, which was made from a species of Murex—hence its name. Murexid may be prepared from uric acid, and as this exists in abundance in guano, that material has been found one of the best sources from which to obtain it. One process used to produce murexid is to dissolve uric acid in dilute nitric acid, and after evaporating for some time at a temperature a little short of boiling, while still hot, to add a slight excess of ammonia. Two compounds are formed by this process, alloxan and alloxantin, and their reaction on each other results in the formation of the beautiful minute green metallic-lusted crystals of murexid, which, in combination with some of the compounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexid was becoming extensive until the discovery of the aniline colors, the greater brilliancy of which has checked its employment. The acid combined in murexid, viz. purpuric acid, $C_8H_8N_2O_6H$, is not known in the free state. Its ammonium salt, murexid, was first obtained in 1839 by Liebig and Wöhler. See URIC ACID.

MURFREE, mŭr'frē, MARY NOAILLES (1850—). An American authoress, born in Murfreesboro, Tennessee, best known by the pseudonym of Charles Egbert Craddock. Unable because of lameness to enjoy the usual play of young people, she devoted herself, almost from childhood, to reading and the study of the native types of the Tennessee mountains, where she passed her summers. Her novels began to appear in 1884. The chief titles are: *In the Tennessee Mountains* (1884); *The Prophet of the Great Smoky Mountains* (1885); *In the Stranger People's Country* (1891); *The Phantoms of the Foot-Bridge* (1895); *The Mystery of White-Face*

Mountain, and Other Stories (1895); *The Young Mountaineers* (1887); *The Bushchackers, and Other Stories* (1899); *A Spectre of Power* (1903).

MURFREESBORO. A city and the county-seat of Rutherford County, Tenn., 32 miles south-east of Nashville; on the Nashville, Chattanooga and Saint Louis Railroad (Map: Tennessee, E 5). It is the seat of Soule Female College (Methodist Episcopal, South), opened in 1852, and of the Mooney School, established in 1901. The city is the centre of an agricultural region largely interested in cotton and fruit growing, and has manufactures of flour, lumber, cedar ware, leather, carriages, cotton gins, machine shop products, etc. Near the city is the Stone River battlefield (see **STONE RIVER, BATTLE OF**), the site of a national cemetery with 6150 graves, 2333 of unknown dead. Murfreesboro was first settled in 1811, and was incorporated in 1817. From 1819 to 1825 it was the State capital. Population, in 1890, 3739; in 1900, 3999.

MURFREESBORO, BATTLE OF. See **STONE RIVER, BATTLE OF**.

MURGER, mur'zhá', HENRI (1822-61). A French novelist and poet, born in Paris, March 24, 1822, who made attractive to his readers the irresponsible life of artists and students in Paris. Among his works are: *Scènes de la vie de Bohème* (1848); *Scènes de la vie de jeunesse* (1851); *Les buveurs d'eau* (1854); *Madame Olympe* (1859); other prose tales; and the poems *Les nuits d'hiver* (1861). To Murger, if to any one writer, literature perhaps owes the word 'Bohemia,' signifying not a geographical spot, but a moral condition. Murger left some classic tales and songs of dissolute thriftlessness and literary impecuniosity that have deluded a generation into looking back with dreamy regret on the sordid follies of their student days. The first Romantic generation, that of Gautier, had real enthusiasm, the ardor and fervor of renaissance, for which Murger's whimsical hysteria of merriment and his vicious sentimentality are but a poor substitute. Murger was trained for the law, became for a time secretary of Count Leo Tolstoy, but like that earlier Bohemian, Villon, he chose dissipation rather than decency. He died in a charity hospital in Paris, January 28, 1861. A monument was recently erected to his memory, not without protest. Several of Murger's songs are translated by Andrew Lang in *Ballads and Lyrics of Old France* (London, 1872). 'Estimates' of Murger by fellow-Bohemians may be found in *Les nuits d'hiver* (Paris, 1862).

MURGHAB, mūr-gāb'. A river of Central Asia, rising in the Paropamisus Mountains, on the northern boundary of Afghanistan (Map: Afghanistan, J 3). It flows northwest into Russian Turkestan, irrigates the Merv Oasis, and after a course of 366 miles is lost in the sands and marshes of the desert about 150 miles below Merv.

MURIATIC ACID. See **HYDROCHLORIC ACID**.

MURIDÆ (Neo-Lat. nom. pl., from Lat. *mus*, Gk. *mūs*, *mūs*, mouse). The family of rats and mice, typified by the house-mouse (*Mus musculus*). It embraces in its seventy-six genera (Thomas) more than a third of all the rodents, is world-wide in its distribution, and includes many species of great importance to man, as pests or

otherwise. The family has been most fully monographed by O. Thomas in the *Proceedings of the Zoölogical Society of London* (1881), p. 528. Consult also authorities cited under **RODENTIA**; and see **MOUSE**, **RAT**, **GERBIL**, **HAMSTER**, **WATER-RAT**, **VOLE**, **MUSKRAT**, and similar titles.*

MURILLO, mūr-rē'yó, BARTOLOMÉ ESTEBAN (1617-82). A Spanish religious and genre painter of the school of Seville. He was, after Velazquez, the greatest figure in Spanish art, and unquestionably the most important religious painter of Spain. He was born in Seville, probably December 31, 1617. Very little is known of his early life. When quite young he was apprenticed to his uncle, Juan del Castillo, from whom he learned the rudiments of painting; but upon the departure of the latter to Cadiz in 1640, Murillo was left without means, and for the succeeding two years he supported himself by painting rough, brilliantly colored pictures for the *Feria*, a weekly market. His close contact with the beggars and print-sellers gave him unusual opportunity for studying their characteristics, and his reproductions of them upon canvas exhibit a sympathy and realism alike notable. These earlier works may be cited as representing the artist's first period, during which he attained results intensely individualized and at the same time expressive of the type.

The example of Moya, a fellow pupil in the studio of Castillo, made Murillo discontented with his position at Seville, and he resolved to visit Rome, but, not having the means for the longer journey, set out on foot for Madrid. Velazquez gave him shelter in his own house and access to the royal galleries, where, with untiring zeal, he copied Ribera, Titian, Rubens, Van Dyck, Velazquez, and other masters. This course of practice, extending from 1642 to 1645, gave him a much freer style and greater control of color—the chief characteristics of his second period. This era, generally known as his 'warm [calido] style,' was characterized by the execution of works exhibiting especially a masterly control of color contrasts. The series of pictures upon which the painter was employed from 1645 to 1648 for the small Franciscan convent near Casa del Ayuntamiento typify the early works of this second period, and through their success he received many commissions.

In 1648 Murillo married a wealthy and noble wife, and his house became the resort for the distinguished people of Seville. In 1650, upon the death of Pacheco, he became the acknowledged head of the Seville school and the president of the academy founded in 1660. During these years he was continually improving in style, becoming more idealistic in conception and individual in technique. The result of this transitional epoch was the third period or last phase, known as *el vaporoso*, from a certain vaporous or misty effect produced. A favorite subject of this era was the "Immaculate Conception," which he painted no fewer than twenty times, the most famous example being in the Louvre, Paris. It was taken from Spain by Marshal Soult, and bought by the French Government at the Soult sale, in 1852, for 586,000 francs.

Murillo is very popular with the general public, but less so with the artists, who, while acknowledging his facility and charm, find his work lacking in technique, force, and originality. His work is highly subjective; so much so that

MURILLO

"THE IMMACULATE CONCEPTION," FROM THE PAINTING IN THE LOUVRE, PARIS

the attention of the beholder is attracted to the personality and technique of the artist rather than to the subject represented. Murillo's chief importance consists in the wonderful manner in which he employed the medium of Spanish realistic forms to express ideal religious conceptions.

Much of the work of the artist was taken from Spain during the Peninsular campaign, a fact that accounts for the number of fine examples to be found in the galleries of Europe; the various collections of London possess 105 of his paintings, and those of Paris 21. Among his principal works were eight large pictures painted for the Hospital of Saint George (1661-74), of which three—viz. "Moses Striking the Rock," the "Miracle of the Loaves and Fishes," and "San Juan de Dios Attending the Sick"—remain in their original places.

The Cathedral of Seville is rich in his works, among which are: "Saints Leander and Isidore;" the "Vision of Saint Anthony" (1656); and "La Purissima" (1668). In the museum are seventeen of the twenty-six pictures painted for the Capuchin monastery at Seville, among which are four "Immaculate Conceptions." In the Prado Museum (Madrid) are the beautiful "Children of the Shell" (the infants Jesus and John), the "Adoration of the Shepherds," the "Education of the Virgin," and "Saint Elizabeth of Hungary Healing a Leper." Other famous works are: "The Birth of Mary" (1655) and "The Holy Family, with Saint Elizabeth" (1670), in the Louvre; "The Vision of Saint Anthony," in the Berlin Museum. The best examples of Murillo's Madonnas are in the galleries of Dresden, Madrid, Seville, Florence (Pitti Palace), and Rome (Corsini Palace). Of his admirable series of genre subjects representing children in the action of eating, throwing dice, and selling fruit and flowers, the best-known examples are in the national collections of Munich, Paris (Louvre), London, and Saint Petersburg. Murillo's last work was the altarpiece of Saint Catharine, painted at Cadiz for the Church of the Capuchins. The picture was never completed, owing to a fall, which compelled his return to Seville, where he died shortly afterwards, April 3, 1682. He was buried, by his own request, in the Cathedral of Seville, before Pedro de Campagna's picture of the "Deposition from the Cross." Consult the biographies of Murillo by Tubino (Seville, 1864); Stromer (Berlin, 1879); Lücke, in Dohme, *Kunst und Künstler*, vol. iii. (Leipzig, 1880); Minor, in "Great Artists Series" (London, 1882); Alfonso (Barcelona, 1886); Justi (Leipzig, 1892); Knackfuss (Bielefeld, 1896). See, also, Curtius, *Velasquez and Murillo* (London, 1883); Lefort, *Murillo et ses élèves* (Paris, 1892); Stirling-Maxwell, *Annals of the Artists of Spain* (London, 1848).

MURISON, ALEXANDER FALCONER (1847—). An English jurist and historian, born in Aberdeenshire and educated at the University of Aberdeen. In 1883 he was appointed professor of Roman law, and in 1901 of jurisprudence in University College, London. He was editor of *The Educational Times* (1902), and wrote: *The External History of Roman Law* (1885), and, in the "Famous Scots Series," *Sir William Wallace* (1898) and *King Robert the Bruce* (1899).

MURMELIUS, JOHANNES (c.1480-1517). A Dutch humanist, born in Roermond, Gelder-

land, and educated at Deventer, at Cologne, and at Münster. In the last city he taught for some time, and then at Deventer and Alkmaar. One of the foremost humanists of the day, he introduced the study of Greek almost single-handed, and published many excellent school books. His *Scoparius in Barbarici Propugnatores et Osoros Humanitatis* (1514) and his defense of Reuchlin are important documents. Consult the biography by Reichling (Freiburg, 1880) and the selections from his poems, edited by Reichling (ib., 1881).

MURNER, myr'nēr, THOMAS (1475-1537). A German priest, famous mostly for attacking Luther and the Reformation. Murner taught and preached in Freiburg, Paris, Cracow, and Strassburg. After voyages to Italy and England he settled in Strassburg, whence in 1525 he was frightened away by the Reformation. Murner was highly enough prized for his religious poems to be made laureate by Maximilian I. in 1505. In 1506 he took his doctorate in theology; in 1513 he became guardian of the Franciscan cloister at Strassburg. In 1519 he became a doctor of jurisprudence at Basel. After a stormy life Murner died at his birthplace, Oberenheim, near Strassburg, in 1537. In his *Gäuchmatt* and his *Narrenbeschwörung*, Murner shows some realistic humor. He translated the *Æneid* in 1515; whether he wrote the High German version of the *Eulenspiegel*, a kind of chap-book, originally in Low German, is not known. His selected works were published in Kürschner's *Deutsche National-litteratur* (Stuttgart, 1890 et seq.). Consult: Kawerau, *Murner und die Kirche des Mittelalters* (Halle, 1890); *Murner und die deutsche Reformation* (Halle, 1891).

MUROM, mō'rōm. One of the oldest towns of Russia, situated in the Government of Vladimir, on the left bank of the Oka, 84 miles southeast of Vladimir (Map: Russia, F 3). It has an old cathedral, a gymnasium, two monasteries, and a convent. The town is noted for the vegetables raised in the vicinity. It manufactures tallow and soap, and has trade in grain. Murom is believed to have existed before the time of Ruric, and had rulers of its own, who were subjugated by the princes of Moscow at the end of the fourteenth century. Population, in 1897, 12,589.

MURPHEY, ARCHIBALD DE BOW (1777-1832). An American jurist, born in Caswell County, N. C. He was educated at the University of North Carolina. He served as a tutor and then as professor of ancient languages until 1802, when he was admitted to the bar. From 1812 to 1818 he was a member of the State Senate. While in this body he was a member of the committee appointed in 1816 to consider the establishment of a system of public schools, and at the session of 1817 submitted an elaborate plan which, while not adopted, formed the groundwork for the later attempts. In 1818 he was elected judge of the Superior Courts and was designated to sit on the Supreme bench during three terms in 1819-20. He was interested in internal improvements, and persuaded the State to attempt an elaborate system of canals and harbor improvements. In 1822 he secured a share of the Tennessee land warrants for the University of North Carolina, and thus saved that institution from ruin.

MURPHY, ARTHUR (1727-1805). A British actor and playwright, born at Clomquin, Roscommon, Ireland, December 27, 1727. Having studied at the English college at Saint Omer in France (1738-47), he became a clerk to a merchant in Cork (1747-49), and worked in a London banking house (1749-51). Turning to literature, he started the *Gray's Inn Journal* (1752-54) in imitation of Addison's *Spectator*. In 1754 he appeared at Covent Garden as Othello. In this and other parts he was moderately successful. Beginning with *The Apprentice* (1756), he wrote many farces and clever satires, mostly adapted from the French, and tried his hand at several tragedies. Among his many miscellaneous works are an edition of Fielding with a memoir (1762), an essay on Dr. Johnson (1792), a translation of Tacitus (1793), and a *Life of Garrick* (1801). He died June 18, 1805, at Knightsbridge. His plays and early essays were collected (8 vols., London, 1786), and his life was written by J. Foot (ib., 1811).

MURPHY, FRANCIS (1836—). An American temperance evangelist, born in Wexford, Ireland. He served in the Federal army during the Civil War. Beginning in 1870 at Portland, Me., he started temperance reform clubs throughout that State, and was their first president. His headquarters were in Pittsburg, Pa., and after his first addresses there in 1876, 45,000 people signed the pledge, a number that was soon increased to 10,000,000, as a result of his ministrations in different parts of the United States. He labored also in England, and he acted as chaplain in the Spanish-American War.

MURPHY, HENRY CRUSE (1810-82). An American politician and historian, born in Brooklyn, N. Y. He graduated at Columbia College in 1830, studied law, and was admitted to the bar in Brooklyn, where he became city attorney and, in 1842, Mayor. The next year he became a member of Congress. At the expiration of his term he was elected a delegate to the New York State Constitutional Convention of 1846. In 1847 he was again sent to Congress, and in 1852 was a prominent candidate for the Democratic nomination for President. In 1857 President Buchanan appointed him Minister to Holland, where he remained until 1861. He was for a time an editor of the *Brooklyn Eagle*, but he is perhaps best known for his researches in the early colonial history of New York, which led to the discovery and publication of many interesting and important documents. Probably the most valuable of these is De Vries's *Voyages from Holland to America, 1632 to 1644* (1853), which he translated from the Dutch. During his residence at The Hague as American Minister he printed for private distribution two monographs, *Henry Hudson in Holland: Origin and Objects of the Voyage Which Led to the Discovery of the Hudson River* (1859); and *Jacob Steendam, Noch Vasater. A Memoir of the First Poet in New Netherland, with His Poems, Descriptive of the Colony* (1861). The latter of these was reprinted in his *Anthology of New Netherland; or, Translations from the Early Dutch Poets of New York, with Memoirs of Their Lives*, issued by the Bradford Club in 1875.

MURPHY, JAMES GRACEY (1808—). An Irish Presbyterian clergyman, born at Ballytikilikan, County Down. He graduated at Trin-

ity College, Dublin, in 1833, was appointed minister at Ballyshannon in 1836, became classical headmaster at the Royal Belfast Academical Institution in 1841, and professor of Hebrew at the Presbyterian College of Belfast in 1841. He published a number of volumes, among them a *Latin Grammar* (1847); a *Hebrew Grammar* (1857); *The Human Mind* (1873); and commentaries on (1864) Genesis, (1866) Exodus, (1872) Leviticus, (1875) the Psalms, and (1882) Revelation.

MURPHY, JOHN FRANCIS (1853—). An American landscape painter. He was born in Oswego, N. Y., studied art by himself, and first exhibited in 1876 at the National Academy, of which he was elected an associate and later an Academician. Murphy worked both in oils and water colors. Among his paintings are: "Sultry Season" (1884); "The Yellow Leaf" (1885); and "Sundown" (1886). His work is exceptional for the beauty of its coloring.

MURPHYSBORO. A city and the county-seat of Jackson County, Ill., 86 miles southeast of Saint Louis, Mo.; on the Big Muddy River and on the Illinois Central, the Mobile and Ohio, and the Saint Louis Valley railroads (Map: Illinois, C 6). It is the centre of a farming district that has considerable mineral wealth, particularly deposits of coal, and carries on a trade of some importance. There are manufactures of flour, lumber, beer, foundry and machine-shop products, brick, etc. Population, in 1890, 3880; in 1900, 6463.

MURRAIN, mŭr'rin (OF. *morine*, from Lat. *mori*, Skt. *mar*, to die). A general term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as foot-and-mouth disease. 'Bloody murrain' is sometimes used referring to anthrax, and 'dry murrain' is similarly applied to Texas fever.

MURRAY, ALEXANDER (1755-1821). An American naval officer, born at Chestertown, Md. At the outbreak of the Revolution he received a commission in the navy, but while waiting for a ship served, during 1776-77, as lieutenant and captain in the First Maryland Regiment, and participated in the operations around New York. In the latter part of 1777 he commanded the *Revenge* with letters of marque to prey on British commerce. He was captured, but after exchange served on board the *Trumbull*, and was again captured. When exchanged again he commanded a privateer and afterwards served on the *Alliance*. When the navy was reorganized in 1798 he was one of the first six captains appointed, and commanded the *Montezuma* during the troubles with France. He was transferred to the *Constellation* and saw some service in the Mediterranean during the war with Tripoli.

MURRAY, ALEXANDER (1775-1813). A linguist, son of a shepherd, born at Dunkitterick, Kirkcudbrightshire, October 22, 1775. Murray taught himself French, Latin, Greek, and Hebrew; made his way through Edinburgh University, became parish minister of Urr in his native shire (1808), and professor of Oriental languages in Edinburgh University (1812). He died April 15, 1813. Murray edited in a thorough manner Bruce's *Travels* (1805; new ed. 1813); wrote for his students *Outlines of Ori-*

tal Philology (1812); and contributed to the *Edinburgh Review*. After his death appeared his chief work, *History of the European Languages*, with a memoir and the fragment of an autobiography (2 vols., Edinburgh, 1823).

MURRAY, ALEXANDER STUART (1841-1904). A distinguished English archaeologist, born near Arbroath. He was educated at the University of Edinburgh and in Berlin. In 1867 he was appointed assistant in the department of Greek and Roman antiquities of the British Museum, and in 1886 keeper of the same. He published a *History of Greek Sculpture* (London, 1890); *Handbook of Greek Archaeology* (London, 1892); *Designs from Greek Vases* (London, 1894); *Terra-Cotta Sarcophagi* (London, 1898); and edited many official publications of the British Museum.

MURRAY, DAVID (1830-1905). An American educator. He was born at Bovina, Delaware County, N. Y., where his parents had immigrated from Scotland in 1816. He graduated from Union College in 1852. The following year he became assistant in the Albany Academy, and in 1857 was advanced to the principalship. In 1863 he accepted the chair of mathematics and physics in Rutgers College. Having assisted the Japanese Embassy in 1872 in their labor of investigating the educational systems of this and other countries and preparing statistics thereon, he was invited by Japan to assume the supervision of its educational affairs. He removed to that country and was occupied for six years in these duties. At the time of his return to America in 1879 he was decorated by the Emperor with the Order of the Rising Sun. In 1880 he became secretary of the Regents of the University of the State of New York, and held this post nine years. He published several addresses, and is the author of *Manual of Land Surveying* (1872); an introductory chapter to *Outlines of the History of Japanese Education* (1876); *The Story of Japan* (1894); *History of Education in New Jersey* (1899).

MURRAY, DAVID CHRISTIE (1847—). An English novelist, born at West Bromwich, in Staffordshire, April 13, 1847. He was educated at a private school. He began his career as a reporter on the *Birmingham Morning News*, and in 1873 went to London, where he joined the staffs of the *Daily News* and the *World*. In 1879 he published in *Chambers's Journal* his first long novel, *A Life of Atonement*. Other books are: *Joseph's Coat* (1881); *Val-Strange* (1882); *Time's Revenge* (1893); *In Direst Peril* (1894); *A Rogue's Conscience* (1896); *Tales in Prose and Verse* (1898); *A Race for Millions* (1898); many other novels; and the interesting essay, *My Contemporaries in Fiction* (1897).

MURRAY, Lord GEORGE (c.1700-60). A Scottish Jacobite general, son of the first Duke of Athol. His father was loyal to the House of Hanover, but Lord George followed his elder brother, the Marquis of Tullibardine, into the Jacobite uprising of 1715, commanded a battalion at Sheriffmuir, and made his escape to France the following year. He was living in Scotland at the time of the rebellion of 1745, and was the most capable of Prince Charles's generals. To Lord George Murray's personal bravery, sound judgment, and skill in handling undis-

ciplined troops must be attributed the chief credit for the Jacobite victories at Prestonpans and Falkirk, as well as for the Highlanders' safe retreat from England after the raid to Derby. Murray escaped to the Continent when the cause was lost and died in Holland.

MURRAY, GEORGE HENRY (1861—). A Canadian statesman of Scottish parentage, born at Grand Narrows, Nova Scotia. He began his education in his native place, finished it at Boston University, was called to the bar in 1883 and practiced his profession at North Sydney, N. S. He was elected to the local House in 1889, and after being a member of the Nova Scotia Cabinet (1891) he became Premier and Secretary for his native province (1896). In 1897 he was sent to the Dominion Parliament as Liberal member for Victoria County.

MURRAY, GRENVILLE (1824-81). An English journalist, the illegitimate son of Richard Grenville, second Duke of Buckingham. After studying at Magdalen College, Oxford, and at the Inner Temple, he entered the diplomatic service, and held various posts at Vienna, Hanover, Constantinople, and Odessa. Returning to England in 1868, he founded *The Queen's Messenger* (1869), the first of the English satirical society papers. Driven from England, he settled in Paris, where he figured as the Comte de Rethel d'Aragon, borrowing the title of his Spanish wife. He was one of the pioneers in the gossip and scandal of modern journalism. Among his separate publications are: *The Roving Englishman* (1854); *Round About France* (1878); and *Side Lights on English Society* (1881), containing a mock dedication to the Queen.

MURRAY, HUGH (1779-1846). A Scottish geographer, born at North Berwick. After 1816, when he became a fellow of the Royal Society of Edinburgh, he applied himself to the study of geography. He was chiefly noted for his share in the *Encyclopædia of Geography* (1834). He also compiled historical or geographical works upon *The Southern Seas* (1826); *Polar Seas* (1830); *Africa* (1830); *British India* (1832); *China* (1836); *British America* (1839); and *The United States* (1844).

MURRAY, JAMES (c.1725-94). A Scotch soldier, and the first British Governor of Canada. He was the fifth son of Alexander, fourth Lord Elibank, and entered the army about 1740. In 1757 he was sent with his regiment to America, where he commanded a brigade in the siege of Louisburg in 1758, and led the left wing of Wolfe's army in the battle on the Heights of Abraham, September 13, 1759. The next year he successfully defended Quebec against an attack by a superior French force under De Lévis, and later in the same year assisted General Amherst in reducing Montreal. He was appointed Governor of Quebec in October, 1760, and of all Canada in 1763, and continued in that position until 1766. He became Governor of Minorca in 1774, was besieged in Fort Saint Philip in 1781 by the French and Spanish under the Duc de Crillon, and after a desperate defense was forced in 1782 to capitulate. Upon his return to England he was tried by a court-martial, but was acquitted. He became a full general in 1783, and died near Battle, in Sussex. For an account of his career in America, consult Parkman's *Montcalm and Wolfe* (Boston, 1884; new ed. 1898).

MURRAY, JAMES AUGUSTUS HENRY (1837—). A distinguished English lexicographer, born at Denholm, Roxburghshire, Scotland, in 1837. After his elementary studies at home and in Edinburgh, he continued his work at London University. Having taught at Hawick, he became master of Mill Hill School, near London, a position which he retained for fifteen years (1870-85). Already distinguished as a scholar, he had been twice elected president of the Philological Society (1878-80, 1882-84). For that society he assumed, in 1879, the editorship of the *New English Dictionary on Historical Principles*, the most exhaustive work in lexicography ever attempted in any language. In 1885 Dr. Murray moved from Mill Hill to Oxford, where his Scriptorium is a notable feature of the city. Before beginning this work, he had published many valuable monographs, and edited for the Early English Text Society the *Minor Poems of Sir David Lyndesay* (1871); the *Complaynt of Scotland* (1874); and the *Romance and Prophecies of Thomas Erceldoune* (1875). In 1884 he received a civil list pension of £270. He has also been honored by degrees from English, Scotch, and German universities. A full account of the beginning of the dictionary and of its making is to be found in Dr. Murray's address to the Philological Society (1879). See **DICTIONARY**.

MURRAY, or MORAY, JAMES STUART, Earl of (1531?-1570). A Scotch statesman. He was the natural son of James V., of Scotland, and half-brother of Mary, Queen of Scots. Destined for an ecclesiastical life, he was educated from 1541 to 1544 at Saint Andrews, and early received ecclesiastical benefices. He accompanied his sister Mary to France in 1548, returning the following year to gain as a youth military experience and renown by driving a strong party of English from the coast with great loss. It is probable that he began to sympathize with Protestants as early as 1552, and it is certain that he was an attendant on Knox's lectures in 1555, and joined with others in urging his return from Geneva the following year. From 1556 on he was the consistent leader of the Scotch reformers, and after 1558 till his death he was the most powerful single factor in Scotch politics. He was present at Mary's marriage to the Dauphin of France, afterwards Francis II., and was sent to France in 1561 to invite the widowed Mary, after the death of the Queen Regent, to return to Scotland as its Queen. For a few years Lord James Stuart, as Mary's chief minister and adviser, seemed to subordinate his own ambition to the good of Scotland, the preservation of his religion, the future union of England and Scotland, and the success of his sister's reign. In 1562 Mary created him Earl of Mar, and shortly after Earl of Murray. When it became evident that she would not be acknowledged by Elizabeth as her successor, Mary turned to a Catholic alliance, which forced Murray to break with his sister, and a series of intrigues and counter-intrigues began. At first, inclined to favor the marriage of Mary with Darnley, he soon saw that it meant Catholic supremacy, hence he opposed it finally by an appeal to arms, but was defeated and forced to take refuge in England (1565). In 1566, after intriguing with Bothwell, professing at the same time friendship for Darnley, and being

cognizant, at least, of the plan to murder Rizzio, Murray returned to Edinburgh to regain his power. For the moment outwardly reconciled to his sister, he went to France, but returned shortly at the request of the lords, who had taken arms, to become Regent of the Kingdom. After Mary's escape from prison, he defeated her forces at Langside, near Glasgow, 1568, and on her flight to England he became one of the commissioners sent to that country to conduct the negotiations against her. Later, however, he urged Elizabeth to permit Mary to return to Scotland, but was assassinated in 1570 by Hamilton of Bothwellhaugh, before his plans had matured. He was a cold, ambitious man, endowed with great abilities, personally moral, but in politics without scruples. Consult authorities cited under **MARY STUART**.

MURRAY, JOHN (1741-1815). The founder of the Universalist body in America. He was born at Alton, England, December 10, 1741. At the age of eleven his parents removed to Cork, Ireland. He became a Methodist under the preaching of Wesley and Whitefield. Having read a book by James Rely, a Universalist, he was led to adopt his views, and for this was excommunicated at Whitefield's Tabernacle, London. Persecution for opinion, pecuniary embarrassment, and grief for the loss of his wife, caused him to seek retirement in America. He preached his first sermon in America September 30, 1770, in a small church, in an obscure place in New Jersey, called 'Good Luck.' Believing fully in the doctrine of universal salvation, he gave himself to earnest labor, first in New Jersey and New York, afterwards in Newport, Providence, Boston, Portsmouth, Norwich, and other places in New England. In 1774 he fixed his residence in Gloucester, Mass., where he was represented as a Papist, and a secret emissary of Lord North in the interest of the English Ministry. He was abused, and by a vote ordered to leave the town, but the interference of powerful friends saved him, and he was allowed to remain. In 1775 he was appointed chaplain of a Rhode Island brigade encamped near Boston. Ill health compelled him to leave the army, and he returned to Gloucester, where he was settled over a society of Universalists. He was instrumental in the organization of a convention of his sect, which met at Oxford, Mass., September, 1785, and took the name of Independent Christian Universalists. In 1793 he was installed pastor of a society of Universalists in Boston, where he remained till his death, September 3, 1815. He published *Letters, and Sketches of Sermons*, 3 vols., and an autobiography (1813), continued by his wife (9th ed. by Demorest, 1870).

MURRAY, originally MACMURRAY, JOHN (1745-93). The first of four great English publishers, John MacMurray, of the stock of the Murrays of Athol, was born in Edinburgh. Having served as lieutenant of marine (1762-68), he retired on half pay and began to publish and sell books in London. John MacMurray purchased the bookselling business of Paul Sandby, opposite Saint Dunstan's Church, London, and, dropping the Scottish prefix, became a bookseller and purchaser at '32 Fleet Street.' He brought out the *English Review*, and published the first two volumes of the elder Disraeli's *Curiosities of Literature*, etc. He died November 16, 1793,

and was succeeded in due time by his son JOHN (1778-1843). One of the earliest hits of John the second was Mrs. Rundall's *Domestic Cookery* (1808), which had been through sixty-five editions by 1841. With the coöperation of Scott, Canning, and others, he founded the *Quarterly Review*, a Tory organ, in opposition to the *Whig Edinburgh Review*, then at the height of its influence. The first number was published February 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought Murray into communication not only with the chief writers, but also with the conservative statesmen of the time. A still more fortunate acquaintance was that with Lord Byron, whose *Childe Harold* (first two cantos) was published by Murray in 1812. Murray now removed from Fleet Street to Albemarle Street, where the business is still carried on. Almost all the literary magnates of the day were four o'clock visitors in Albemarle Street. Murray paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were princely. The second John Murray died in 1843, and was succeeded by his son, JOHN MURRAY the third, who was born in 1808. He was educated first at the Charter House, and afterwards at Edinburgh University. Many great works in history, biography, travel, art, and science were issued by the third Murray. Among his successes were Livingstone's *Travels and Last Journals*; Smiles's *Life of George Stephenson*; and Darwin's *Origin of Species by Natural Selection*. At his death (April 2, 1892) he was succeeded by his son, the fourth John Murray (born in 1851). Consult Smiles, *A Publisher and His Friends* (London, 1891).

MURRAY, Sir JOHN (1841—). An English naturalist and oceanographer. He was born at Coburg, Ontario, studied at Victoria College there and at the University of Edinburgh, and devoted himself to natural science. In 1868 he went through the Arctic regions on a whaler studying fauna and flora; from 1872 to 1876 was a naturalist of the *Challenger* expedition; and after six years' service as assistant became editor of the scientific reports of the *Challenger* voyage. He contributed to the *Narrative of the Cruise of H.M.S. Challenger* (1882-85) and wrote the *Challenger Report on Deep-Sea Deposits*, with Renard (1890). Murray was knighted in 1898.

MURRAY, JOHN CLARK (1836—). A writer on philosophy and ethics, born at Paisley, Scotland, March 19, 1836. He studied at Glasgow, Edinburgh, Göttingen, and Heidelberg. In 1862 he became professor of mental and moral philosophy in Queen's University, Kingston, Canada, and in 1872 he was called to a similar chair in McGill University, Montreal. He is author of *An Outline of Sir William Hamilton's Philosophy* (1870); the *Ballads and Songs of Scotland* (1874); *Memoir of David Murray* (1891); *Handbook of Psychology* (1885); *Solomon Maimon, an Autobiography*, translated from the German (1888); and an *Introduction to Ethics* (1891).

MURRAY, LINDLEY (1745-1826). An English grammarian, born at Swatara, Lancaster County, Pa., April 22, 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting-house, from which he escaped to a school in New Jersey. He afterwards studied

law and had a good practice in New York. During the Revolutionary War he engaged in trade with such success as to accumulate a handsome fortune. His health failing, he went to England and purchased an estate at Holdgate, near York, where he devoted himself to literary pursuits and botany. His garden rivaled the Royal Gardens at Kew. In 1787 he published his *Power of Religion on the Mind*, which passed through twenty editions. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises*, the *Key*, the *English Reader*, *Introduction and Sequel*, and a *Spelling Book*, which went through some fifty editions. Murray died February 16, 1826. Consult the *Memoir of Murray*, containing an autobiography by Frank (York, 1826), and *Life* by Egle (New York, 1885).

MURRAY, or MORAY, Sir ROBERT (?-1673). A Scotch statesman. He was educated at Saint Andrews University, entered the French army, and, through the influence of Richelieu, rose to the rank of colonel. He was chosen secret envoy to negotiate a treaty between Scotland and France, and while at Newcastle in December, 1646, formed a plan for the escape of Charles I., which came to nothing through the King's irresolution. In 1651 he was appointed justice-clerk, and soon afterwards was made a Privy Councillor and a Lord of the Session, but never took his seat upon the bench. After the Restoration as Lord of Exchequer and Deputy Secretary he was one of the triumvirate, the other two members of which were Lauderdale and the King, that ruled Scotland from 1663 till 1670. He was one of the founders of the Royal Society, the oldest scientific society in Great Britain. As a chemist and musician he had considerable reputation in his time.

MURRAY, WILLIAM, first Earl of Mansfield. An English jurist. See MANSFIELD, WILLIAM MURRAY, FIRST EARL OF.

MURRAY, WILLIAM HENRY HARRISON (1840-1904). An American clergyman, lecturer, and man of business. He was born at Guilford, Conn., and was graduated from Yale College in 1862. From 1868 to 1872 he was pastor of the Park Street Church, Boston, and during his incumbency he gave several series of popular sermons, or Sunday evening lectures, before large audiences in Music Hall, and later published these discourses in two volumes, *Music Hall Sermons* (1870-73). He subsequently withdrew from the ministry, and later followed a varied career in business, lecturing, and writing. In addition to several volumes of sermons and tales, he wrote *Adventures in the Wilderness, or Camp Life in the Adirondack Mountains* (1868); *The Perfect Horse* (1873); *Adirondack Tales* (1877); and other stories.

MURRAY, WILLIAM VANS (1762-1803). An American diplomat, born in Cambridge, Somerset County, Md. He received a classical academic education in America, and in 1783 went to London, where he studied law for two years in the Inner Temple. Returning to Maryland in 1785, he was admitted to the bar, and began the practice of his profession, in which he soon attained prominence. From 1791 to 1797 he was a Federalist member of Congress. In 1797 he was appointed by President Washington United States Minister to the Netherlands, and in 1799, with

Oliver Ellsworth and William R. Davie, was sent to Paris to negotiate a treaty which should adjust the difficulties that had brought France and the United States to the verge of war. The successful negotiation of the convention signed at Paris, September 30, 1800, was said to be largely the work of Murray. He was the author of a valuable brief treatise on *The Constitution and Laws of the United States*.

MURRAY BAY, or **MALBAIE**. A summer resort of Charlevoix County, Quebec, Canada, on the left bank of the Saint Lawrence River, 90 miles east of Quebec, with which it has steamboat communication (Map: Quebec, F 3). Picturesquely situated on the Murray estuary which forms the bay, it is the principal watering place on the north shore of the Saint Lawrence, and is much frequented for its romantic scenery, invigorating air, bracing though cold bathing, its boating, and fishing. The town, of which lumber mills constitute the chief industry, is at the mouth of the Murray River, the dependent summer colonies being at Pointe à Pic (population, in 1901, 537) and Cap à l'Aigle, the extremities of the bay, three miles distant. It was one of the stations for United States prisoners of war in 1776. Population, in 1901, 826.

MURRAY RIVER. The principal river of Australia, draining, together with the Darling, practically the whole southeastern quarter of the continent. It rises in the Australian Alps near the eastern boundary of Victoria, and flows for two-thirds of its course northwestward, forming the boundary between Victoria and New South Wales (Map: Australia, G 5). After entering South Australia, it makes an abrupt turn to the south, and enters the Indian Ocean through Encounter Bay, 40 miles southeast of Adelaide. Its length is about 1500 miles. For the first 60 miles of its course it passes between precipitous rocky cliffs, in one place, known as the Murray Gates, reaching an enormous height, while some of the highest peaks of the continent are close to either shore. After passing through the Gates the hills become gradually lower, and finally the river enters the immense Australian Plains. Here the Murray is sluggish, with numerous windings, and flanked by lagoons. It receives here scarcely any tributaries except a few very large ones coming from the mountains. Among these are the Murrumbidgee (q.v.), which is longer than the main stream from the point of confluence, and the Darling (q.v.), whose length exceeds that of the entire main stream. During the dry season the river shrinks even in its lower course to a width of less than 300 feet, but in winter its volume increases enormously, and great inundations occur. In the wet season it is navigable for small steamers for the greater part of its course as far as Albury, but its mouth, owing to sand bars, is inaccessible for large vessels. There are a number of ports on its shores, whose total shipping probably amounts to more than one and a half million tons annually.

MURRAYSHIRE. A maritime county of Scotland. See **ELGINSHIRE**.

MURRE (also *marre*, of uncertain etymology). Any of several species of guillemot (q.v.).

MURRELET, mŭr'let (diminutive of murre). Any of several small murre-like birds confined to the North Pacific Ocean. The black-throated

murrelet (*Synthliboramphus antiquus*) is a handsome black and white bird, about ten inches long. It breeds from Sitka northward, and is found as far south as Oregon in winter. A Japanese murrelet is closely allied to it. The remaining four species represent another genus (*Brachyramphus*) chiefly distinguished by a more slender and less compressed bill. Two of the species are Arctic forms, one coming south to southern California in winter, while the other two occur in southern and Lower California.

MURRELL, WILLIAM (1853—). An English physician. He was educated at University College, London, where he was scholar and demonstrator (1875-78). Having received the title of *lauréat* from the French Medical Academy in 1881, he served as medical examiner at Edinburgh (1882-87), and in the Royal College of Physicians in London (1886-90), and became physician and lecturer at Westminster Hospital. He wrote: *Angina Pectoris* (1880); *medal from the French Academy*; *Bronchitis* (1890); *Materia Medica* (1900); and *Forensic Medicine and Toxicology* (1902).

MURRUMBIDGEE, mŭr'rŭm-bij'é. A river of New South Wales, the second largest tributary of the Murray. It rises on the northeast slope of the Australian Alps, in the southeastern corner of the State, within 40 miles of the Pacific coast (Map: Australia, H 5). It flows first northward through a hilly country, then westward through the great plains till it enters the Murray 90 miles, in a straight line, southeast of the mouth of the Darling. Its length is 1350 miles, but, though it is longer than the Murray from the point of confluence, it is not of great commercial importance, owing to its shallowness. During the wet season it is navigable 500 miles for light-draught steamers. Its principal affluent is the Lachlan (q.v.).

MURSA. The Roman name for Eszék (q.v.).

MURSHIDABAD, mŭr'shē-dā-bād'. The capital of a district of Bengal, British India, on the left bank of the Bhagirathi, a branch of the Ganges, 115 miles north of Calcutta (Map: India, E 4). Azimganj, on the opposite side of the river, with ferry communication, is usually reckoned part of Murshidabad. The town covers a great area, several miles in length and breadth. The buildings are for the most part of mud, but there are several brick structures—mosques and tombs—along the river bank; and centrally situated is the Nizamat Kila or Nawab's palace, a building of great beauty, completed in 1840. The town is on the most frequented water route from Calcutta to the United Provinces. Its trade was formerly of great importance. Its banking connections are still considerable, Jain merchants here being among the wealthiest in India. The rearing of silkworms and the weaving of silk are the chief of many industries, which include ivory carving, the manufacture of gold and silver lace, of hookah pipes, musical instruments, etc. Murshidabad was the last Mohammedan capital of Bengal, and after the British annexation remained the capital until 1790, when the administrative seat was settled at Calcutta. Population, in 1891, of Murshidabad and Azimganj, 35,756; in 1901, of Murshidabad 15,168, of Azimganj 13,383, total 28,551.

MURU'MURU PALM. See **ASTROCARYUM**.

MURVIEDRO, mōr-vyā'drō. A small town of Spain, in the Province of Valencia, occupying the site of the ancient Saguntum (q.v.) (Map: Spain, E 3). Population, in 1900, 6784.

MURZUK, mōr-zōōk' or **MOURZOUK**. The capital of Fezzan (q.v.), North Africa, situated in an unhealthy region in latitude 25° 50' N., and longitude 14° 10' E. (Map: Africa, F 2). It is surrounded by a wall and has an extensive palace. The inhabitants manufacture leather and textiles. The population is estimated at 6500.

MUSACEÆ, mō-zā'sē-ē (Neo-Lat. nom. pl., from *Musa*, from Ar. *mauz*, banana-tree), THE BANANA FAMILY. A natural order of generally stemless monocotyledonous plants, which resemble trees in appearance, and sometimes rival palms in stateliness. The long sheathing bases of the leaf-stalks combine to form a false stem. From the midrib to the margin of the leaf blade are many fine parallel veins. Hence the wind tears the tissue between them and makes the leaves very ragged. The flowers are borne on spadices in cymes or racemes often with bright colored bracts which are protected by spathes. The fruit is either fleshy or a three-valved capsule. The species (about 60) are widely distributed in warm climates, and are of great value, the fruit of some, particularly of the genus *Musa*, being much used for food, the fibres of the leaves of others for cordage and for textile purposes. A very interesting species is the traveler's tree (q.v.) of Madagascar. The principal genera are *Musa*, *Strelitzia*, *Ravenala*, and *Heliconia*. The species of the first three are found almost wholly in the Old World, those of the last named in the New. See **PLANTAIN**; **BANANA**; **HEMP**, **MANILA**.

MUSÆUS (Lat., from Gk. *Mousaios*, *Mousaios*). A legendary Greek poet, and personification of the powers of the Muses. His parents were said to be Eumolpus or Antiphemus and Selene, and in story he was closely connected with Orpheus, of whom he is variously called teacher, son, and pupil. He is especially associated with the Eleusinian mysteries, which he was said to have founded, and many poems apparently connected with this worship, or oracular, were attributed to him. He had no existence outside of legend. A later Musæus, who probably flourished about the end of the sixth century of the Christian Era, was the author of a very pleasing amatory poem, in Greek, entitled *Hero and Leander*, discovered in the thirteenth century, of which the first edition was published by Aldus Manutius about 1494; critical edition by Dilthey (Bonn, 1874). See **HERO**.

MUSA IBN NOSEYR, mō'sā lb'n nō-sīr' (c.660-713). An Arab governor of Northern Africa, who gave permission to Tarik (q.v.) in 711 to make an expedition into Spain, which led to the Moorish conquest of the Peninsula. Musa, jealous of the success of his subordinate, crossed himself in 712 with an army of eighteen or twenty thousand men. He made conquest after conquest, but was checked in 713 by an order of the Caliph to repair at once to Damascus. He left immediately, his son Abdul Aziz taking command. When Musa arrived at Damascus he was deprived of his command, disgraced, and killed, while his son met his death in his palace at Seville, at the hands of a messenger from Da-

mascus. Consult Burke, *History of Spain*, vol. i. (London, 1895).

MUSÄUS, mū-zä'us, JOHANN KARL AUGUST (1735-87). A German writer, best known for his *Volksmärchen der Deutschen* (1782-86), a collection of tales blending genial humor, quaint fancy, and common sense. Musäus was born in Jena, March 29, 1735. He studied theology, became in 1763 tutor of pages at the Court of Weimar, and in 1770 professor at the Weimar Gymnasium. His literary career began (1760) with a successful parody of Richardson's *Grandison*. Then, after eighteen years' silence, he satirized Lavater's whimsical theories in *Physiognomische Reisen*. His sprightly and genial *Freund Heins Erscheinungen in Holbeins Manier* (1785) are interesting because they show the rising influence of Wieland. He died at Weimar, October 28, 1787, before completing *Straussfedern*, a series of tales. In 1788 appeared the clever skits *Moralische Kinderklapper*. Other posthumous writings were gathered in 1791 with a notice of Musäus by his pupil and relative, Aug. von Kotzebue (Leipzig, 1791). There is a *Life* by Müller (Jena, 1867).

MUSCÆ VOLITANTES, müs'sē vōl't-tān'tēz (Lat., flying flies). The term applied to floating grayish spots before the eyes. Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibres, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibres are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines. The doublings and crossings of the loops or knots in the twisted fibres appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision these objects are usually unobserved, though some persons can easily see them, especially when looking at a bright surface. They are caused by shadows cast upon the retina by cells which occur normally in the vitreous humor. They occur most often with errors of refraction and disturbances of digestion. They are of no importance whatever. After a sudden movement of the eyes they appear to settle downward. Fixed black spots, not moving at all while the eyes are motionless, are suggestive of actual disease and demand an ophthalmoscopic examination.

MUSCARDINE (Fr. *muscardine*, *muscadin*, It. *moscardino*, *moscadino*, musk lozenge, from *moscato*, ML. *muscatum*, musk, from Lat. *muscus*, musk), or **SILKWORM ROT** (*Botrytis bassiana*). A serious fungous disease of silkworms. It consists of erect branching threads, with clusters of spores at the ends of short lateral branches. The spores germinate on healthy silkworms, especially those in the last stage before spinning their cocoons. They germinate also on the caterpillars of other lepidopterous insects, and on the common house-fly. Diseased worms die suddenly, become discolored, and are soon hard and dry. Within twenty-four to thirty-six hours their bodies may be covered with a whitish powder, the spores of the fungus. For the prevention of this disease absolute cleanliness in the breeding house is necessary; rooms should be cleansed and fumi-

gated after an outbreak to prevent infection of the new brood.

MUSCAT, müs-kät'. An old name for the Arabian State of Oman (q.v.).

MUSCAT, MUSKAT, or MASKAT, müs-kät'. The capital of Oman, in Southeastern Arabia, situated on the Gulf of Oman (Map: Turkey in Asia (Arabia), T 11). It is fortified and has a good harbor, which makes it one of the most important commercial centres in Arabia, and the port for almost all the trade of Oman, amounting to over \$5,000,000 annually. Though situated amid beautiful surroundings, it is poorly built and unclean, and its climate is very hot and unhealthful. The population is estimated at 40,000. Muscat is the seat of a British Resident and has been declared to be under British influence. In the sixteenth century Muscat was captured by the Portuguese, but was restored to the ruler of Oman in the seventeenth century.

MUS'CATEL (also *muscadet*, OF. *muscadet*, *muscadet*, Fr. *muscadet*, from ML. *muscatellum*, muscatel wine, diminutive of *muscatum*, musky odor, from Lat. *muscus*, musk). The name given to many kinds of sweet and strong French and Italian wines, whether white or red. Among the finest are the white Rivesalt and red Bagnol wines from Roussillon, the Lunel from the Pyrenees, and the Lacrymæ Christi and Carigliano of Naples. See WINE.

MUSCATINE, müs'ká-tên'. A city and the county-seat of Muscatine County, Iowa, 210 miles west of Chicago; on the Mississippi River, and on the Chicago, Rock Island and Pacific, the Burlington, Cedar Rapids and Northern, and the Iowa Central railroads (Map: Iowa, F 3). It is built on high bluffs at a bend of the river; and among noteworthy features are the Musser Library (public), a soldiers' monument, and a high bridge across the river. The city carries on considerable trade in lumber and agricultural produce, being known especially for the water-melons grown on Muscatine Island, just below the city. It is an important industrial centre, its establishments including flour and oatmeal mills, pickle works, foundries and machine shops, rolling mills, sheet iron, boiler, and engine works, manufactories of various lumber products, lead works, potteries, button factories, box and packing case factories, brick and tile works, carriage and wagon shops, etc. Settled in 1833, Muscatine was incorporated first in 1839. The government, under a charter of 1851, subsequently amended by State special charter laws, is vested in a mayor, elected every two years, and a unicameral council, which controls important powers of confirmation and election in administrative offices. The police judge, treasurer, wharf master, assessor, and school board are chosen by popular vote. The city owns and operates the water-works. Population, in 1890, 11,454; in 1900, 14,073.

MUSCHELKALK, mush'el-kalk (Ger. shell-lime). The middle member of the Triassic or New Red Sandstone period in Continental Europe. In Germany the formation consists chiefly of limestones, which abound in the remains of mollusca; hence the name muschelkalk. The beds are of much economic importance, containing salt, marl, and gypsum.

MUSCI, müs'si (Lat., mosses). The technical name of the group of plants known as mosses, one of the two subdivisions of bryophytes, the other being the Hepaticæ (liverworts). Mosses are adapted to all conditions, from submerged to very dry, and are most abundantly displayed in temperate and Arctic regions. They have great power of vegetative multiplication, new leafy shoots putting out from old ones, thus forming thick carpets and cushions. Bog mosses often completely fill up bogs or small ponds and lakes with a dense growth which dies below and continues to grow above. These quaking bogs or 'mosses' furnish very treacherous footing. In their depths the dead moss plants become slowly modified into peat.

FIG. 1. The so-called flower of a moss in longitudinal section, showing antheridia (a), archegonia (b), and paraphyses (p). Outside all are longitudinal sections of leaves.

There are two great groups of mosses, the Sphagnum forms (peat or bog mosses) and Bryum forms (true mosses). The life history

FIG. 2. 1, gametophyte, showing original spore (y), protonema (p), buds (b) which develop the leafy branches (s). 2, a young sporophyte (c) emerging from the leafy plant (s).

of a true moss shows a distinct alternation of generations (q.v.). When a spore germinates, there is first developed a small, green, thready

body (protonema), upon which appear buds that give rise to the ordinary leafy moss plant. Upon this leafy plant the sex organs (antheridia and archegonia) are borne (Fig. 1), and hence it is the sexual phase (gametophyte) in the alternating generations. The sex organs produce a fertilized egg, which upon germination does not reproduce a leafy moss plant, but a structure of totally different character, namely a stalked spore-case (sporogonium), full of asexual spores, commonly called the moss 'fruit.' Since this sporogonium has no sex organs, it is the sexless phase (sporophyte) in the alternation. When these spores germinate they produce leafy moss plants (gametophytes) again, and so alternation continues. (See Fig. 2.) The spore-case (capsule) of an ordinary moss, generally pendent from a slender stalk (seta), is a very complicated structure. It is usually somewhat urn-shaped, with a little conical or flattish lid (operculum), which is thrown off when the spores are to be discharged. Often

quite common in the Tertiary rocks and especially so in the amber.

MUSCIDÆ (Neo-Lat. nom. pl., from Lat. *musca*, fly). A family of dipterous insects comprising the typical or true flies. The bristle of the antennæ is feathery and the abdomen is smooth except for a certain number of bristles near the tip. The larvæ as a rule feed upon decaying animal or vegetable matter, more abundantly upon the former. The group comprises many species, and includes some of the most common and abundant forms, such as the house-fly, the horn-fly, and the stable-fly (qq.v.).

MUSCLE AND MUSCULAR TISSUE. While contractility is a property of all active, living protoplasm, it is in muscular tissue that this property reaches its highest development, the ability to contract along certain definite lines being the peculiar function of this tissue. Muscle

FIG. 3. 1, the young sporophyte (e) rupturing the bladder-like archegonium and carrying up the upper portion (c) as a hood (calyptra). 2, mature sporophyte (sporogonium), showing foot (f), seta (y), capsule (e), and operculum (o). Both diagrammatic.

also the mouth of the urn is guarded by beautiful hair-like or tooth-like structures which converge toward the centre, and are collectively known as the peristome (around the mouth). Through the centre of the capsule there runs an axis of sterile tissue, called the columella; while capping the top of the capsule like a loose hood is the calyptra, which is the dead and ruptured female sex organ (archegonium) that has been carried up by the elongating sporogonium (Fig. 3). See BRYOPHYTES.

FOSSIL MOSSES. The earliest fossil mosses, Muscites, allied to the modern genus *Polytrichum*, are found in the Carboniferous rocks of Commeny, France. Throughout the Mesozoic formations fossil mosses are rare, though their existence during the Liassic is inferred from the presence in rocks of that age of a beetle of the genus *Birrhus*, which at the present time is known to live in mosses only. Fossil mosses are

A. BICEPS MUSCLE.

tissue occurs in three different forms: (1) *Striated Voluntary Muscle*. This form of muscle is found in all those muscles which are under the control of the will, in fact all those which in the common use of the term are called 'muscles,'

INVOLUNTARY MUSCLE IN LONGITUDINAL SECTION.

such, e.g. as the biceps, triceps, etc. (2) *Non-striated Involuntary Muscle*. This form of muscle occurs in the muscles which are not under the control of the will, those which carry on the automatic functions of life, such as the muscles of the intestine, which control its peristaltic action, or the muscles of the arteries and veins, which govern their contractility. (3) *Striated Involuntary Muscle or Cardiac Muscle*. This is a peculiar form of muscular tissue found only in the heart. It appears to occupy a sort of intermediate position between the other two forms.

INVOLUNTARY MUSCLE IN TRANSVERSE SECTION. A.r.t., areolar tissue.

(1) *Non-striated Involuntary Muscle*. This form of muscular tissue, while not occurring in any such large masses as does the voluntary muscle, has an extremely wide distribution. It forms the muscularis mucosæ and muscular coats of the gastro-intestinal canal, the muscular walls

of the arteries and veins, of the trachea and bronchi, of the larger ducts of glands, and occurs in the urinary tract, and in the male and female generative organs, etc. It consists of long, slender, spindle-shaped cells from .075 to .230 milli-

VOLUNTARY MUSCLE.

Smooth muscle fibres from the small intestine of a frog.

meter in length and from .004 to .010 millimeter broad. Its substance shows fine longitudinal markings. A delicate sheath or cell wall has been described and within this is the semi-fluid granular protoplasm of the cell body. In the

centre of the latter lies a long rod-shaped nucleus toward each end of which a few fine granules are found. These cells are arranged in bundles, the individual cells being held together by a cement substance, the bundles being surrounded by more or less connective tissue. Blood-vessels ramify in this connective tissue where they break

VOLUNTARY MUSCLE.

nuc., nuclei; t.m.s., termination of muscular substance.

up into capillaries which form a network among the muscle cells. Nerves, mainly of the sympathetic system, pass to the individual muscle cells.

(2) *Striated Voluntary Muscle.* This form of muscular tissue constitutes the ordinary voluntary

muscles of the skeletal system, and occurs in the pharynx, larynx, diaphragm, generative organs, etc. It is composed of long cylindrical fibres, each one of which represents a highly specialized development of a single cell. The muscle fibre consists of the muscle substance proper, the muscle nuclei, and an external sheath or sarcolemma. The muscle substance of a fibre shows a longitudinal striation which indicates its division into ultimate fibrillæ, while transversely it consists of alternate light and dark bands or disks. The light disk is crossed by a delicate dark line, the line or membrane of Krause. A light line across the dark disk (Hensen's line) has also been described, but is probably an artefact.

VOLUNTARY MUSCLE IN TRANSVERSE SECTION.

m.f., muscle fibres; end., endomysium; per., perimysium.

The minute bit of muscular tissue separated off by Krause's line at either end and by the dividing line between the fibrillæ on each side is known as the 'sarcoelement of Bowman,' while the appearance presented by the cross-cut ends of the fibrillæ composing a single fibre is called 'Cohnheim's field.' Each fibre is inclosed

in a transparent, very delicate, but tough and elastic sheath, which cannot always be readily seen, but often shows distinctly, stretching between the separated fragments of a fibre which has been broken within it, its toughness and elasticity allowing it to resist a force sufficient to rupture its more brittle contents. This sheath is known as the sarcolemma or myolemma, the former term being derived from the Greek words *sarx*

(flesh) and *lemma* (skin or husk), the latter from the Greek words *mus* (muscle) and *lemma*. Just beneath the sarcolemma, in the muscle protoplasm, lie the muscle nuclei. They are oval or spindle in shape, their long axes corresponding to those of the fibre. The individual muscle fibres are held together by a delicate connective tissue called the endomysium. The muscle fibres are bound together into bundles or fascicles by a coarser connective tissue, the perimysium, while the entire muscle is surrounded by a connective tissue sheath, the epimysium. In short muscles single fibres may extend the entire length of the muscle. In longer muscles the single fibres do not extend the entire length of the muscle, averaging 25 to 50 millimeters in length. Very long fibres, 100 to 120 millimeters long, are sometimes found. The fibres taper somewhat at their ends and terminate, if in the middle of the muscle, by a blending of the sarcolemma with the endomysium of the neighboring fibres; if in tendon, periosteum, or perichondrium, by union of the sarcolemma with the connective tissue. Striated muscle is extremely vascular. The larger vessels run in the perimysium, where they branch, and these smaller branches give off capillaries which form a rectangular meshed network among the individual fibres. The larger nerve trunks run in the perimysium, where they subdivide and send branches to the muscle fibres. Here they terminate in special 'end plates.' See NERVOUS SYSTEM.

INJECTED VOLUNTARY MUSCLE.

SECTION OF CARDIAC OR HEART MUSCLE (striated involuntary muscle).

m.c., muscle columns; l.d.z., zone of less differentiated sarcoplasm; nuc., nucleus.

(3) *Cardiac or Heart Muscle (Striated Involuntary Muscle).* This is a type of muscular

tissue peculiar to the heart. It resembles the smooth involuntary muscle in being composed of nucleated cells. These cells are, however, much larger and broader than the smooth muscle cells,

HEART MUSCLE.

are more or less rectangular in shape, and send off lateral branches which join similar branches of neighboring cells, with which they are connected by cement substance. The cell protoplasm shows both longitudinal and transverse striations, but much less marked than in striated voluntary muscle. A cross-section of a cell gives somewhat the appearance of Cohnheim's field, but the fibrillæ show a more or less radial arrangement about the circumference. The nucleus is round or slightly oval in shape and is situated near the centre of the cell.

DEVELOPMENT. Muscle is developed from the mesoderm or middle layer of the embryo. Smooth muscle cells are produced by a differentiation of mesodermal cells. Voluntary striated muscle is developed by a still further specialization of these mesodermal cells, the cell nuclei proliferating and longitudinal and transverse striations appearing in the protoplasm. In this way the cells become gradually transformed into the fibres of voluntary muscle. Heart muscle has the same derivation, and represents an intermediate stage of development between the more primitive smooth muscle cells and the more highly specialized striated muscle fibres.

MUSCLE-READING. The intuition of a person's thought by physical contact. Every complete mental process tends to 'issue' or 'express itself' in movement; the psychophysical organism is essentially a motor organism. In many cases these expressive or concomitant movements are involuntary, and unknown to their performer. It is often possible, by close attention to them, to get an inkling of the object or direction of the agent's thought. Some persons, indeed, have a peculiar aptitude for this 'muscle-reading,' or (as it has been wrongly termed) 'mind-reading,' so that they are able, by taking into account all the objective indications presented by the agent, to reproduce in somewhat surprising detail the course of his thought.

Muscle-reading was much in vogue a few years since as a drawing-room game. On the stage, it is customary for the 'mind-reader' to lay the hand of the subject upon his forehead, or to take the subject's hand in his own. By minute observation of the subject's involuntary movements, of his tremor or flush of excitement, etc., it is possible for the reader to guess, in many instances, the number of a watch, the place and character of a hidden object, etc.; the subject being completely unaware that he is giving any suggestion, and the suggestions themselves being unnoticeable to the audience. With the most successful mind-readers the process of observation has become habitual and therefore partly unconscious, so that they are unable to explain their *modus operandi*, even if they desire to do so. Their extreme fatigue, at the conclusion of a performance, indicates, however, that their attention has been under great strain.

This appreciation of unconscious movements and of vasomotor changes in the subject is suffi-

cient to explain all the feats of mind-reading that are on record, surprising as some of these may appear. Consult: Jastrow, *Fact and Fable in Psychology* (New York, 1900); Preyer, *Die Erklärung des Gedankenlesens* (1886); and *Nineteenth Century*, xx. 867; *Forum*, xi. 192; *Popular Science Monthly*, x. 459, xxi. 634.

MUSCLE SENSE. A term used, in a wider signification, to mean "the sum total of the sensations which inform us of the condition of our motor organs" (Henri). This usage has its root in the theory that our chief reliance, in perceptions of the movements of our limbs, is upon the sensations set up in the voluntary muscles. Goldscheider has, however, conclusively proved that the perception of movement is mediated, not by sense-organs in the muscles, but by the sensory nerve-endings of the joints (articular sensations). Moreover, the definition proposed by Henri must include (or must tacitly ignore) visual sensations; for we undoubtedly derive a good part of our knowledge of movement by seeing our limbs move. There seems, then, to be no justification for retaining the term 'muscle sense' in the meaning indicated. If we wish to group together the sensations concerned in movement, to emphasize their functional conjunction, we may take Bastian's word 'kinæsthetic' sensations. The kinæsthetic 'group of senses furnishes us with data for the perception of the positions and motions of our members and of the body as a whole, and plays a leading part in the perception of space. It includes some senses whose existence or efficiency is disputed (innervation sense and muscle sense), and others whose independence has only of late been generally recognized (joint sense and tendon sense). All are closely united with one another and with pressure and contact, and some are hardly ever dissociated except by disease" (Sanford).

The specific sensation of the voluntary muscle, 'muscular sensation' in the narrower sense, although it is of little functional import (except, perhaps, as the chief sense-basis of the feeling of muscular fatigue), is easily isolated by laboratory procedure. If the position of the arm be kept constant, so that there is no change of articular sensation, the cutaneous sensations ruled out by etherization, and an induction current passed through the body of a muscle, we get a dull, diffuse, vague sensation, which is localized in the substance of the arm. With high degrees of muscular contraction, the sensation takes on a dragging or grinding character, and presently verges on pain (q.v.). It is unquestionably a specific sense-quality, best described as a dull, dead pressure, and most nearly akin to (though by no means identical with) the pressure sensations obtained by lightly pressing a blunt object upon the cutaneous surface. When once known to introspection, it can be reproduced by mechanical stimulation (heavy pressure) as well as by electric current.

There is also a special tendinous sensation, mediated by the tendons which attach the voluntary muscles to the bones. This is the sensation of strain, which appears, e.g., when the arm is bent for a considerable time, when the fist is clenched, etc. It is radically different from the dead pressure of the muscle, and is a sharp pressure (seemingly independent of the dead pressure) that comes

from the articular surfaces. It plays a large part in the perceptions of weight, resistance, etc., enters into the fatigue-complex of exhausting bodily exercise, and occurs in muscular cramp. Its variations do not necessarily run parallel to the variations of the muscular sensation, for very different degrees of muscular contraction are, obviously, compatible with one and the same amount of pull upon the tendons. (Paris, 1899); Titchener, *Experimental Psychology*, vol. i. (New York, 1901).

MUSCOGEE, müs-kō'jé. A town of the Creek Nation, Indian Territory, 154 miles north by east of Fort Worth, Tex., on the Missouri, Kansas and Texas Railroad (Map: Indian Territory, H 3). It is the seat of the Henry Kendall College (Presbyterian), opened in 1894, and is the headquarters of the United States agent for the Indians. The town is the commercial centre for extensive agricultural and stock-raising districts. Population, in 1900, 4254.

MUSCOVITE. A mineral aluminum-potassium silicate that crystallizes in the monoclinic system, and is the most common member of the mica group. Its usual color ranges from gray to brown, but it also occurs in different shades of green, violet, yellow, and sometimes rose-red. It has a vitreous lustre that is more or less pearly or silky, and its specific gravity is from 2.76 to 3. Muscovite is one of the essential constituents of granite, gneiss, mica-schist, and certain other rocks. It is widely distributed in nature, occurring most abundantly in Tyrol, Styria, on the Saint Gotthard, and elsewhere in Switzerland, as well as at Paris, Me., Grafton, N. H., Chesterfield, Mass., and numerous localities of North Carolina, in the United States. The fact that it has a cleavage parallel to the base, and is easily separated, forming thin elastic plates which are transparent to translucent, led to its use as the material for window-panes in Russia, whence its name of *Muscovy glass*, and to its extensive and similar use in stoves under the name of 'isinglass.' It is also employed commercially in wall paper, as a filler, in electrical machines as an insulator, and to a certain extent as a paint. See MICA.

MUSCOVY. A name formerly applied to Russia, whose capital down to the beginning of the eighteenth century was Moscow. The word is still used in ornate style.

MUSCOVY DUCK (corrupted from *musk-duck*). A large South American duck (*Cairina moschata*) in which the male is much larger than the female, and has fleshy wattles on the forehead and lores, and a crest of long feathers. This duck has long been domesticated in Brazil and in Europe, where it is especially in favor in Germany. In this country they are less esteemed, because of their quarrelsome nature and ability to harm one another or their companions in the poultry yard. Two varieties are recognized, 'colored' and 'white,' which are thus described in Howard's *Farmers' Bulletin*, No. 64, of the United States Department of Agriculture (Washington, 1897): The head of the colored muscovy is glossy black and white; the bill is dark-horn in color; eyes, brown; the back in

color of plumage is lustrous blue black, which is sometimes broken with white; the color of the breast and body is the same as that of the back. The wing coverts are rich, lustrous green black, and the tail feathers may be either black or white, the latter being preferred. The thighs, like the tail feathers, may be either black or white, white being preferred; the shanks, toes, and webs vary in color from yellow to dark lead or black. The white muscovy in color of plumage is pure white throughout; feathers of any other color will disqualify the bird for show purposes. The eyes in the white variety are of a leaden-blue or gray color, while those of the colored are brown. The shanks, toes, and webs are of a pale-orange or yellow color. The standard weight of the adult drake is ten pounds; adult duck, eight pounds. The flesh is good and loses in cooking the musky odor of the living bird.

MUSCULAR FORCE, ORIGIN OF. This subject has occupied the attention of physiologists for many years, and numerous theories have been offered to explain the phenomena of muscular energy. The older observers, represented by Liebig, held that nitrogenous food went to build up and maintain muscular tissue and that energy was evolved in the splitting up (or oxidation) of this class of food, the waste being represented in the excreted urea. The non-nitrogenous foods (carbohydrates or starches, and fats), on the other hand, were supposed to be entirely devoted to the production of heat. Muscular work should therefore cause a distinct increase in the elimination of urea. But this theory is invalidated by the fact that the excretion of urea does not keep pace with the production of energy. Later observers have taken the opposite view, that force is generated by the oxidation of non-nitrogenous substances, and that the nitrogen constituents of muscle are rather to be looked upon as forming a part of the machine in which the former substances are burned than as constituting the fuel themselves.

It has been suggested by Herman that muscular activity depends upon the splitting up and subsequent re-formation of a complex nitrogenous body which he calls *inogen*. From the decomposition of this body there result carbon dioxide, sarcosolactic acid, and a gelatino-albuminous body. Of these the carbon dioxide is carried away by the blood, and the acid and the albuminous substance, at least in part, go to rebuild the *inogen*. The other materials of which the *inogen* is formed are supplied by the blood. Of these materials oxygen and some carbohydrate substance form a part. The decomposition takes place both in resting and active muscle, but is much greater in the latter. This theory explains certain known facts of muscular metabolism; first, that muscle absorbs oxygen and gives off carbon dioxide during both rest and activity, and that increased exchange of these gases takes place during the latter condition; that this process is attended by the production of heat; and that muscle during rest produces nitrogenous crystallizable substances such as kreatin from the metabolism going on constantly during life.

For a full discussion of this subject, see Foster, *Textbook of Physiology* (New York, 1900), and Kirke, *Handbook of Physiology* (Philadelphia, 1902). See also article PHYSIOLOGY.

MUSCULAR SYSTEM, EVOLUTION OF. The muscular system comprises those tissues or masses of tissue which have the property of contractility and whose function it is to accomplish the movements of the parts or of the whole of the animal body. Contractility is one of the properties of simple protoplasm. Thus, the amoeba progresses by the extension of some portion and the contraction of other parts of its body. The cortical layer of *Paramecium* is a specially contractile region in the protoplasm. In the *Stentor* and the stalk of *Vorticella* there are protoplasmic differentiations that resemble muscle fibres.

Many of the outer-lying ectoderm cells of *Hydra* show considerable differentiation; they are conical in shape with the broad surface outward. On this external surface a thin, cuticle-like layer has been demonstrated. Internally the cell ends in a contractile basal portion or process which lies parallel to the long axis of the body of the hydra and between the ectoderm and entoderm. The whole of these cells are contractile, but the long processes are specially so. These processes were formerly known as 'neuro-muscular,' but with the discovery of special nerve cells, the muscular function alone must be conceded to them. Like the muscle cells of vertebrates they contract when properly stimulated. Here then are ectodermic muscle cells, the entire protoplasm of which, like that of the amoeba, is irritable and contractile, but with a portion of the cell more clearly set apart to perform the contractile function than in any protozoan. In the jelly-fishes, such as *Aurelia*, a muscle cell is likewise composed of two parts: a contractile portion (which shows cross striations), and, attached to the striated portion, a protoplasmic, non-differentiated, non-contractile portion which may bear cilia on its external surface. This muscle-bearing epithelium is arranged in a bundle or ring around the edge of the sub-umbrella. It is the contraction of this muscular zone that propels the jellyfish through the water. In the tentacles and about the lips unstriated muscle-fibres occur. The contraction and extension of the body of the sea-anemone, as well as of its gullet and mesenteries, and its ability to move slowly from the point of attachment, are accomplished by means of a well-developed muscular system. This consists of bands of longitudinal muscle fibres which run on the mesenteries from the base to the disk; of parietal muscles which pass obliquely across the lower and outer angle of the mesentery; and of a thin sheet of transverse muscles. The contraction of the longitudinal muscles draws the animal toward the base, and that of the transverse muscles causes the contracted animal to extend again. A band of circular muscles at the junction of column and disk causes the disk and contracted tentacles to be inclosed within the body of the anemone. In addition to the bands of muscles, scattered fibres occur both in the body wall and in the gullet, which consist partly of spindle-shaped, nucleated fibres, and partly of such striated muscle processes as occur in *Hydra*. The latter are mostly found in the transverse muscles of the body and the tentacles, and are of entodermal origin, as also are the muscle bands of the mesenteries. Other longitudinal muscles are of ectodermic origin. Some of the muscles, however, sink so far down into the middle layer or mesoglea as to seem to belong to it alone. This is significant because all the

musculature of animals above the coelenterates lies between the ectoderm and entoderm.

The musculature of flatworms falls under two groups: (1) the dermal musculature, and (2) the dorso-ventral musculature. The dermal musculature lies either under the basal membrane of the epidermis or under the cuticle. It is composed of distinct layers. In each layer all the fibres run in one and the same direction. There are longitudinal muscles, transverse and diagonal muscles. The musculature is stronger on the ventral creeping surface. In cestodes the diagonal layer is replaced by a second circular layer. The dorso-ventral musculature runs from the dorsal to the ventral surface, and is much displaced at sexual maturity by the male and female germ-glands. Below the cuticular layer of roundworms there is a well-developed muscular layer in the form of a tube, and composed of outer circular fibres and inner longitudinal ones. This muscular tube effects the writhings and undulations of the body. As in the coelenterates, the muscle element is composed of a single cell, made up of a protoplasmic (often glandular) portion and a fibrillar part. The fibrillæ rarely show any evidence of cross striation, the lateral lines are free from muscle fibres, and the longitudinal sheet is thus broken up into bands.

The muscular system of mollusks is also well developed. The muscle fibres, both of bivalves and gastropods, are all of the unstriated sort, because of the slow movements of the animals. These fibres occur usually in distinct bands or sheets, and frequently are combined for greater power to form very large muscles, such as the two abductors of *Anodonta*, which close the shell. Other important muscles are those of the foot, including two protractors and one retractor; and in the snail those that work the radula of the mouth, the retractors of the horns and penis, and those that pull the head into the shell. The muscles are fastened to the shell, upon which they make certain distinct markings at the points of attachment, called 'scars.'

The musculature of segmented worms, like that of the roundworms, is composed of a dermo-musculature tube which is composed of an outer circular and an inner longitudinal layer of fibres. The fibres are in the form of bands. The pharynx, mouth, gut, parapodia, and septæ have special muscle fibres. In leeches, in addition to the circular and longitudinal bands of muscle fibres, there are bands reaching diagonally from the dorsal to the ventral surface of the body.

Among arthropods the musculature of the Crustacea is well developed and very complex, but there is little evidence remaining of the dermo-muscular tube of worms. It is assumed that the dorsal and ventral pair of longitudinal muscles correspond to the four similarly situated bands of muscle in the Polychæta. Perhaps traces of the circular musculature of annelids are found in the muscles that are attached to the basal parts of the appendages on the one hand, and to the integument of the body on the other. Certainly the firmer exoskeleton makes greater localization of the musculature possible. In the limb-bearing portion of the abdomen and the thorax there are paired dorsal and ventral muscle bands. In the limbless part of the abdomen there is a thick layer or tube of longitudinal muscle fibres, interrupted at each septum by the connective tissue that separates the myomeres. Thus the muscle

itself is separated into myomeres. The abdomen is bent upward, downward, or sidewise by the contraction of the muscle fibres in the corresponding portion of the body. The appendages are moved by muscles that pass out into them from the trunk. The muscles are either attached to the cuticular outer covering or to inward projecting parts of it, and often terminate in sinewy pieces that are white and are composed of bundles of cross-striated fibres—the kind of fibre that characterizes all rapidly moving muscle. In *Peripatus*, however, the muscles are unstripped, save those which work the jaws. In insects, the thorax and metathorax, as in the case of the grasshopper, are crowded with leg and wing muscles. In the cockroach, where the wings are little used, the wing muscles are poorly developed.

The musculature of *Amphioxus*, like that of the abdomen of Crustacea, is divided into metameres. Of these muscular segments or myomeres there are about sixty, V-shaped on surface view, with the apex of the V extending forward. The myomeres are composed of striated muscle fibres which extend longitudinally and are attached to the septæ immediately in front and behind them. The myomeres of the two sides alternate. The musculature of the dorsal wall is the thicker.

In cyclostomes, as well as in *Amphioxus*, the muscles of any myomere are attached to the anterior and posterior myocomata of that segment. In selachians a significant change has occurred—the first step toward the complicated conditions of higher vertebrates. Certain of the ventral lateral muscles on either side of the median line become differentiated from the others, in that their fibres move out from the general level in correspondence with their greater functional activity. Thus while the dorsal trunk muscles retain their primitive character, the ventral muscles have become separated into two masses: a pair of strong mid-ventral ones which are known together as the rectus abdominis, and the remaining muscular mass. We next find that in this latter mass the direction of the muscle fibres, which in *Amphioxus* and cyclostomes is horizontal, has become in selachians oblique; so that, from the mid-ventral line, they pass dorso-posteriorly. The remaining less differentiated portion of the ventral musculature is known as obliquus abdominis, or oblique abdominal muscle. Two kinds of changes have now occurred in the vertebrate musculature: (1) There is the functional differentiation of parts of muscles by which they become cut off from the remainder, and (2) changes in the direction of muscle fibres by which originally axial muscles have become oblique. In the lowest vertebrates the anterior and posterior ends of muscles are attached to the adjacent myocomata. With the development of ribs from the fibrous tissue of the myocomata, muscular attachment has, in part, fallen upon them. The derma, indeed, is differentiated from the same tissue as the myocomata; hence it is not surprising that, in the migrations on the ends of muscles to adapt themselves to the new conditions, we find that some muscles are attached to the derma. Finally, some muscles, whose ends come thus to lie outside of the myomeres, may extend alongside of several somites without signs of metamerism. Thus, by these simple modifications, we gain the complex musculature of the higher vertebrates, where there are trunk muscles of different sizes and lengths, often without

metamerism and attached to bony parts such as ribs, or to the skin. In *Amphioxus* the myomeres are arranged with reference to the sagittal plane from which they extend obliquely outward and backward. In cyclostomes the obliquity is so great that the myomeres overlap each other like the shingles on a roof, so that a cross-section of the body may cut three or four myocomata on each side. In many fishes the free edge of the myocomata, as it appears at the surface, is not merely bowed, but is zigzag.

The most typical condition of the amphibian musculature is shown in Urodela. The dorsal lateral muscles retain most nearly the fish-like condition and lie in metameres. When the ribs and transverse processes of the vertebrae become developed some of the muscles gain attachment to them, and thus give rise to the intercostal and intertransversal muscles. The ventral lateral muscles of fishes are disposed in two regions. In Amphibia they comprise four regions, derived from a migration and splitting of the two lateral muscles of fishes. In addition, lying under the internal oblique, there is a muscle that probably has no representative in fishes. It is unsegmented and lies deeper than the skeleton and immediately within the peritoneal lining of the body cavity. The Anura differ from the Urodela chiefly in the absence of the transversal abdominis, and in the diminution or disappearance of myocomata in the adult.

In reptiles, as in Amphibia, the dorsal musculature retains more nearly the primitive condition. With the ossification of the skeletogenous tissue and the consequent attachment of the muscles to the bone, has come about the differentiation of the so-called interspinales, semispinales, intertransversals, longissimus dorsi, and others. The last-named muscle is to be regarded as a part of the dorsal musculature that has lost its metamerism, and now passes from the pelvic girdle to several of the spines of the thoracic vertebrae. The ventral musculature has become still more complicated, due, according to Wiedersheim, to the changed rhythmic method of respiration, controlled through the more and more greatly developed lungs. To meet the needs of respiration the ribs must be moved. The muscles which perform this function have become more powerful in that the ribs have become buried in them. The musculature of successive myomeres, which projects outside or inside the ribs, becomes united into a single sheet. With the disappearance of the ribs in the lumbar region of reptiles a modification of the intercostals must take place. A continuous muscle is developed between the last rib and the pelvis.

The phylogeny of many of the muscles of mammals is not known. The more important muscles resemble those of reptiles.

Two kinds of muscular fibres are found in the vertebrate body. All the quickly moving voluntary muscles are composed of striated fibres. The involuntary muscles are unstriated. The muscle fibre of vertebrate muscle, like that of invertebrates, is formed by the differentiation of a muscle cell. Only in the muscle cell of the lower invertebrates a much smaller portion of the cell is transformed into fibre structure than is the case in vertebrate muscle fibre. The differentiated portion of vertebrate muscle fibre is composed of fibrillæ and forms the main bulk of the cell. The fibrillæ are imbedded in the undiffer-

entiated part, which also surrounds them in the form of a sheath and contains the nuclei.

(ib., 1895-1902).

MUSCULUS, WOLFGANG (properly MÜSLIN) (1497-1563). A German reformer and theologian, born at Dieuze in Lorraine. At fifteen he entered a Benedictine cloister at Lixheim, but left it fifteen years afterwards, having been turned to Protestantism by Luther's writings. In 1531 he became pastor at Augsburg, and for seventeen years was prominent in that city. Musculus was long an eager partisan of union between the Lutheran and Reformed churches and took part in the Wittenberg Agreement (1536), and in the colloquies of Worms and Ratisbon (1540-41). At the time of the Augsburg Interim (1548) he went to Switzerland, and in 1549 became professor of theology at Bern. His views were more strongly Calvinistic in his later years, and with Calvin and Vermigli he may be reckoned as a leader of the sixteenth-century Reformation. Consult Grote, *W. Musculus* (Hamburg, 1855).

MUSÉE SOCIAL, mu'zá' só'syál' (Fr., Social Museum), THE. An organization whose object is to furnish the public with information regarding movements having for their aim the improvement of the moral and material situation of the laboring classes. It resulted from the interest in the social science exhibition at the Paris Exposition of 1889, but was not formally inaugurated until March 25, 1895. The Comte de Chambrun has given the institution an endowment of over 2,000,000 francs. Special collections of all matters pertaining to labor, trades unions, old-age pensions, housing reform, etc., are made and indexed for ready reference. Studies of labor conditions in various countries have been undertaken, and the results published in monographs. Although young, the Musée has proved of great usefulness. It was very active in preparing the excellent exhibit of social economy in the Exposition of 1900. The more important publications of the Musée are contained in the *Bibliothèque du Musée Social*. It issues a small monthly 'circular' containing general matter pertaining to labor.

MUSES (Lat. *Musa*, Gk. *Μοῦσα*, *Mousa*; connected with *μᾶλα*, *mania*, madness). In Greek mythology, the inspirers of song and music. In the Homeric epic their personality and number are vague, the poet now invoking but one Muse, now a number; only in a very late passage in the *Odyssey* are nine mentioned. In the *Theogony* of Hesiod the canonical number, nine, and names appear. Originally probably nymphs of fountains on Mount Olympus, they seem to have been worshiped first in Pieria, whence the cult spread southward and established itself on Mount Helicon at Ascra, and in Thespie. We also hear of shrines at Delphi and at Athens, both on the Ilissus and on the Museum Hill, which thus obtained its name. There are grounds for believing that, like the Charites and Horæ, the Muses were originally three, but nine was their number on Helicon, and this became universally

accepted, as well as the tradition that they were the daughters of Zeus and Mnemosyne (Memory). In art the Muses are frequently represented. On the François vase, an Attic work of the early sixth century B.C., they appear at the marriage of Peleus and Thetis, with Calliope playing on a Pan's pipe at the head. Later artists used them freely, especially in connection with Apollo, or the mythical poets Orpheus and Thamyris. On the basis by Praxiteles at Mantinea they are represented as present at the contest between Apollo and Marsyas. It is to be noted, however, that while there is a tendency to develop definite artistic types for some of the figures, the division of the several branches of poetic art among the Muses and the adoption of fixed attributes to distinguish them is a product of a comparatively late period in the Roman Empire. Even the Hesiodic names did not designate the functions of the Muses, and in the popular usage seem to have been but little employed. The functions of the Hesiodic Muses were thus assigned in the later writers: Clio, history; Calliope, epic poetry; Polyhymnia, the pantomime; Euterpe, music of the flute; Terpsichore, melic poetry and the dance; Erato, the choral lyric; Melpomene, tragedy; Thalia, comedy; Urania, astronomy. Some variations in this classification are found. Consult: Deiters, *Ueber die Verehrung der Musen bei den Griechen* (Bonn, 1868); Bie, *Die Musen in der antiken Kunst* (Berlin, 1887). See also the articles on the individual Muses.

MUSES' LOOKING-GLASS, THE. A play by Thomas Randolph published in *Poems with Muses' Looking-Glass and Amyntas*, 1638. It was performed some time earlier at Cambridge, and is mentioned by Sir Aston Cokain as the "Entertainment." It consists of witty dialogues between personifications of the vices and virtues in the presence of two Puritans, and shows the influence of Ben Jonson on the author. An altered version, entitled the *Mirroure*, appeared in 1758.

MUSEUM (Lat. *museum*, from Gk. *μουσῖον*, *moussion*, temple of the Muses, place for study, museum, from *Μοῦσα*, *Mousa*, Muse). An institution for the preservation, study, and exhibition of objects of art or those of natural origin. The term was originally applied to a place or temple sacred to the Muses, but a little later was bestowed on institutions for the pursuit of the higher branches of learning, such as art and philosophy, the first recorded use of the word for this purpose being the famous *Museum* of Ptolemy Soter at Alexandria. The application of the word to institutions for the preservation and exhibition of works of art or specimens of natural history is comparatively recent, as are the institutions themselves, and seems to have come into vogue with the systematic gathering of objects for public exhibition. Such collections were originally known as cabinets; and while the term was to some extent restricted to small private collections, it was also given to many of very considerable size, such as the State Cabinet of Natural History at Albany, N. Y.

The germ of the modern museum has been thought by some to lie in votive offerings placed in pagan temples or deposited in churches, and in objects of sacred or historical interest preserved in churches and monasteries. And it may be said that one of the earliest references to the preservation of specimens of natural history is

the account of the skins of what are now supposed to have been gorillas brought home by Hanno and presented by him to the Temple of Astarte in Carthage. Museums of art and of natural history had their origin in collections made by the rich and powerful without at first a more definite purpose than to gratify their own pleasure or curiosity. Somewhat later men of science gathered material to further their own special lines of research, and many of these private collections eventually developed into public museums. Thus some of the national museums of Europe had their beginnings in collections made by former sovereigns, while the British Museum grew out of the cabinet and library of Sir Hans Sloane. The Ashmolean Museum, at Oxford, England, was the result of the labors of Elias Ashmole, who began collecting in 1667, while the Museum of the Royal College of Surgeons, London, is based on the anatomical material gathered by the famous surgeon John Hunter, and the Hunterian Museum of the University of Glasgow was founded by his brother, William Hunter. It may be of interest to note that the exploration of America did much to promote the growth of museums and that the cabinets of Sloane and Ashmole, particularly the latter, comprised many specimens from the New World. Incidentally, too, public houses may be credited with some slight share in the development of museums; for, in England at least, they formed small collections of curiosities to attract visitors, and Ardedi, in his work on fishes, mentions three taverns where he had seen specimens of American fishes. Directly related to these, and representing another stage in the development of museums, was the establishment of miscellaneous collections, more or less scientific in their nature, to which visitors were admitted upon the payment of a fee. President Adams mentions a collection of this sort in Norwalk, Conn., formed by a Mr. Arnold prior to the Revolution, but the best of the type in this country were those of the Peales in Philadelphia and Baltimore. Two noteworthy foreign collections were those formed by Sir Ashton Lever, at Manchester, in 1775, and by William Bullock somewhat later at Liverpool. These were eventually taken to London, where they flourished at different periods, and their importance may be inferred from the fact that when these collections were sold various foreign museums sent representatives to attend the sale. Such large private establishments were the immediate precursors of our present State or governmental institutions. These represent the general acknowledgment of the value of museums, and are held to mark a stage in the progress of civilization beyond that of the art gallery or library, since the development of science is far later than that of art or literature.

Great public museums are of comparatively recent date, for while Bacon in his *New Atlantis* outlines such an institution, the establishment of the British Museum in 1753 was the first realization of this idea. In 1789 France transformed a royal into a national collection by opening the Louvre to the public, but the United States did not formally establish a national museum until 1876, although it practically came into existence in 1846, when the Smithsonian Institution was made the custodian of the national collections. The influence of the many expositions held dur-

ing the latter half of the nineteenth century on museums has been very great; the construction of a building for the United States National Museum was a direct result of the Centennial Exposition of 1876, and the Field Columbian Museum, Chicago, owes its origin to the exhibition of 1893. The South Kensington Museum in London, the Ethnological Museum of the Trocadero in Paris, and the Glasgow Art Gallery and Museum are largely due to similar causes.

The development of museums has not merely been in their size and number, but in their scope and functions as well. Originally the specimens exhibited, especially in museums of natural history, comprised the greater or more important portion of the collections, and were mainly for the benefit of men of science. The modern plan is to restrict the number of pieces on exhibition and to select for this purpose those of the greatest educational value; the bulk of material is placed in the reserve series, and is kept thus not merely for study, but for its better preservation, since light is one of the greatest enemies of museum specimens. The constantly increasing size of collections has had something to do in shaping this policy, but it is largely the result of a recognition of the fact that, so far as the general public was concerned, the educational influence of museums depended more on the quality of the things exhibited than on quantity. This has led to careful study of the best methods of arranging and labeling objects on exhibition and so displaying them that they may attract and interest even the casual visitor. No man probably had more to do with bringing about this state of affairs than the late Sir William Flower, Director of the Museum of the Royal College of Surgeons, and subsequently of the British Museum, while in the United States Dr. G. Brown Goode (q.v.) stands preëminent among those who have been most instrumental in making museums instructive to the public. There has been a corresponding evolution in the publications issued by museums, in making them of interest to the general public and not restricting them to papers of a technical nature. We have seen that private collections were formed not only for the preservation of material, but for its study, and this led to the publication of information thus acquired. The germ of museum publications, however, is to be found in the illustrated descriptive catalogue of small private 'cabinets.' The oldest of these works is that issued by Gesner in 1565, describing one of the first systematic collections, that of Johann Kentmann of Dresden. Public museums have followed the same path as private collectors; and while, like individuals, their publication was at first through the medium of scientific societies, the tendency is for museums to become their own publishers. As the transfer of great collections from private to public ownership made them accessible to a greater number of students than before, this in turn has led to the issuing of memoirs by other than regular members of their staff. Many museums also issue guide-books, hand-books, or articles of a somewhat popular nature relating to their collections, and in line with this are courses of lectures on topics illustrated in the various departments of the institution. The steady trend of museum development has been in the line of extending their educational influence and making them of value to the many

instead of to a favored few. Dr. Goode summed up the objects of museums as record, research, and publication; the preservation of material, its study, and the publication of information in the shape of books, and the spread of knowledge by the display of specimens. In a broad way museums may be divided into museums of natural history and museums of anthropology, the former including all natural objects, the latter man and his works. Following Dr. Goode, they may be classified under the following heads: museums of art, natural history, history, anthropology, technology, and commerce. Or, following the same authority, museums may be classed according to their purposes as national, local, provincial, or city; college, or school; professional, or class museums, and museums of special research.

The collection of art museums in modern times began in Italy, where in the fourteenth century the rulers and the nobility began to make collections of coins and gems. Busts and statues were added later, and it was not until the seventeenth century that pictures and drawings were also introduced. The oldest important collections on record are those brought together by Cosmo de' Medici (1389-1464), which form the basis of the present Florentine collections, of which the most important are the Uffizi and Pitti galleries, and the Museo Nazionale. The Vatican (q.v.) collections trace their origin to Pope Julius II. (1503-13); besides these the principal museums of Rome are the Museo Nazionale and the Museum of the Lateran. Probably the equal of these in the wealth and diversity of its collection is the Louvre (q.v.), the National Museum of France, situated in Paris, which also contains the Musée de Cluny, and the Luxembourg (q.v.). The most important provincial cities of France also have museums, devoted chiefly to painting. In Germany the chief collections are the Royal Museums of Berlin, Dresden, and Munich, and the Germanic Museum at Nuremberg. In England the British Museum (q.v.) is by far of the greatest importance. Austria has the Imperial museums of Vienna. The cities of Italy, notably Venice, Milan, and Naples, have national or municipal museums of importance. The Prado Museum in Madrid is the most important in Spain, which has some provincial museums, notably at Seville. The chief museum in Russia is the Hermitage at Saint Petersburg. In the United States the Metropolitan Museum of Art, New York; the Boston Museum of Fine Arts; and the Corcoran Gallery, Washington, are among the more noteworthy. The United States is perhaps the only great nation without a national gallery.

The museum of natural history covers a wide field and includes many branches, any one of which is capable of separate treatment. Thus there are museums of zoölogy, botany, geology, paleontology and mineralogy, or paleontology may be included as a part of a zoölogical, geological, or anatomical museum. The natural history collections of the British Museum constitute the largest and most celebrated museum of natural history in the world, while other famous collections are those of the Jardin des Plantes, Paris, and those of Vienna, Leyden, and Berlin. The most important museums of natural history in the United States, all of which have been extended beyond the province indicated by the

name, are the collections of the Smithsonian Institution at Washington, the American Museum of Natural History in New York, and the Museum of Comparative Zoölogy at Cambridge, Mass.

Historical museums are for the preservation of objects illustrating the history of any country, place, or period, or the development of some special subject, and here it may trespass on the province of the museum of art or of technology. Historical collections form a branch of the United States National Museum, but there are many local collections. The National Museum, Munich, is an example of a general historical museum; the Cluny Museum, Paris, is devoted to a single period; the Naples Museum tells the story of Pompeii; while the Guimet Museum, Paris, illustrates the history of religious ceremonial, and the Museum of Artillery, Paris, traces the development of weapons from the rude axe of the Stone Age to the modern rapid-fire gun. Anthropological museums, in the widest sense, treat of the history of man and his relations to the universe about him. This calls for illustrations of his various activities, so that an anthropological museum may comprise art and historical collections, although these are usually treated separately. The physical characteristics of man, his clothing, weapons, ceremonial objects, household furniture, methods of transportation and of shelter are the subjects most commonly illustrated. Ethnology is that branch of anthropology which deals with the characteristics, occupations, arts, and industries of the races of men as distinguished from one another. Archæology treats of the history of ancient man, and sections of a large museum or an entire museum may be devoted to the illustration of either of these subjects. The Department of Anthropology of the United States National Museum is very extensive, and so is that of the American Museum of Natural History, New York. The Peabody Museum of Archæology and Ethnology, Cambridge, Mass., is particularly rich in American antiquities, and so is the Archæological Museum of the University of Pennsylvania. Abroad there are important anthropological museums in Berlin, Dresden, and Munich; the Trocadero, Paris; and the Pitt Rivers collection at Oxford, the latter being specially arranged to illustrate the development of the arts.

Technological museums deal with various phases of the industrial arts. They display specimens of the raw materials that enter into the composition of a given product, trace the various processes to which these are subjected, show the tools or machinery by which they are manipulated, and finally the finished object or substance. The subjects for technological museums are almost endless; ship-building, spinning and weaving, dyestuffs, drugs, foods, and electric apparatus naturally suggest themselves. The South Kensington Museum (now the Victoria and Albert), London, contains the largest technological collections of any institution. This is now under the charge of the National Board of Education, and its influence is not confined to London, for a part of its work consists in lending carefully selected collections to local museums and technical schools in other portions of Great Britain. In America, the United States National Museum and the Field Columbian Museum, Chicago, have important technological sections, the former having much material illustrating the

development of electrical apparatus, while the latter is rich in objects showing the growth of methods of transportation by rail. The Army Medical Museum, Washington, while devoted to the subject of the structure of man, the effects of injuries and diseases, and their treatment, is a technological museum in so far as it traces the development of surgical appliances. Commercial museums are devoted to advancing the interests of trade. They exhibit raw materials and finished products, illustrations of methods of packing and modes of distribution, and gather and furnish information as to prices and character of goods needed in and furnished by different countries. Laboratories for the analysis of various substances and the testing of materials form part of the equipment of such an institution. The Musée de Mille, Ghent, is one of the oldest European commercial museums. The Commercial Museum, Philadelphia, is the sole institution of its kind in the United States.

MUSEUM PEST. Any one of several species of insects which feed upon the prepared and mounted skins of birds, mammals, reptiles, and upon dried collections of insects and other animals preserved in museums. Perhaps the most abundant and injurious of the museum pests are the beetles of the family Dermestidæ. (See **DERMESTID BEETLES**; see also **BACON BEETLE** and

CARPET BEETLE.) Others of these insects are the larvæ of small moths of the tineine series. Some of the common clothes moths (q.v.) are museum pests which, possibly originally feeding upon skins, have come to feed upon fabrics made from animal substances, such as wool or hair. One of the most injurious of this group is *Tinea pellionella*, which is one of the case-making clothes moths. Other substances stored or displayed in museums are attacked by other insects: the larva of a little geometrid moth, known as *Carphocera ptelearia*, feeds on dried plants stored in herbaria; and the allied *Acidalia herbariata*, as its name indicates, has long been known to injure herbarium specimens in Europe, but is on the whole more injurious in herbalists' shops than in museums. Some of the dermestid beetles will even injure the horns of large mammals, and the bones as well, provided they are not thoroughly poisoned. A museum room once thoroughly infested with these creatures can be most readily freed from them by fumigation with bisulphide of carbon or hydrocyanic acid gas.

MUSH, mōsh. The capital of a Sanjak in the Vilayet of Bitlis, Asiatic Turkey, on the eastern branch of the Euphrates, 80 miles south of Erzerum (Map: Turkey in Asia, J 3). It occupies an elevation at the entrance to a mountain ravine on the south side of a fertile wheat, vine, and tobacco growing plain. The town is noted for its uncleanness and has few good houses. It is the see of Roman Catholic and Gregorian bishops, and has an American mission with Protestant schools. There is an active trade in the agricultural products of the district, and embroidered caps are manufactured. It has historical reminiscences of Xenophon and of Moses of Khorene, the historian. In the vicinity at Sasun occurred a terrible massacre of Armenians by the Turks in 1894. Population, about 27,000, one-half being Armenian Christians.

MUSHROOM (OF. *mouscheron*, *mousseron*, from OF. Fr. *mousse*, moss, connected with AS. *mēos*, OHG. *mios*, *mos*, Ger. *Mies*, *Moos*, OChurch Slav. *mūchū*, Lat. *muscus*, moss). The popular name of edible fungi of the order Hymenomycetaceæ, especially species of *Agaricus* and *Morchella*. The name toadstool is generally applied to species which have an umbrella-shaped cap. The common idea that all such are poisonous is erroneous, because some of the most highly prized species have this habit of growth, and perhaps most of the others are not injurious. The mushroom as it is generally seen is only the fruiting body of the fungus, which arises from a more or less matted mycelium, or 'spawn.' The mycelium or vegetative part consists of numerous slender white threads running in every direction through the soil. Upon these threads small knots develop, increase in size, and finally appear as the ball-like or button-like young mushrooms, which consist of a stalk, terminated by a cap or pileus, bearing upon its under side numerous thin spore-bearing plates or gills radiating from the centre or attachment of the stalk. Near the top of the stalk is a more or less perfect ring (annulus), the remnant of the delicate veil (indusium) that covered the gills during the button stage, but ruptured as the mushroom grew.

The common mushroom (*Agaricus campestris*), one of more than 1000 species of the genus *Agaricus*, is common in fields and pastures,

seldom in woodlands unless open and grassy, growing throughout the summer, but most abundant in the early autumn. It is the most commonly cultivated species, is extensively grown for market, especially near large cities, and is about the only species imported and offered for sale in American markets. This species never attains a very large size; when young the stalk and fleshy cap are white, changing to light brown when older. The stalk is solid and tapers slightly toward the base. The ring is usually conspicuous, the gills pink when young, changing to brownish purple in older specimens. Mushrooms are usually gathered for market when in the ball or button stage before the veil has been broken. They have a pleasant taste and smell, and when the flesh is bruised, turn a reddish brown. The horse mushroom (*Agaricus arvensis*), a close relative, looks very much like the common mushroom, but is much larger and the top of the cap is more shining white. The stalk becomes a little hollow with age; the gills are white at first, changing to brownish purple when comparatively old.

The methods employed in cultivating the common mushroom do not offer any great difficulties. They may be grown out of doors or where the temperature is fairly constant, as in dry cellars or in caves, abandoned mines, and quarries. Beds are made containing at the bottom a deep layer of fresh stable manure, over which is a layer of well-rotted manure. In this the spawn is planted after the temperature of the bed has fallen to about 90° F. The commercial spawn comes in two forms, bricks and flakes, made of horse manure impregnated with the mycelium of the fungus. When planted, both kinds are broken up and distributed through the bed. The beds, which must be kept moist, but not wet, are then well covered with straw or mats to keep the surface moist. After a week or ten days the mulch is removed and the beds covered with good loam to a depth of two inches. They may be again covered with the mulch, which should be removed when the mushrooms, which should be gathered daily, begin to appear.

In addition to the species of *Agaricus* described above, there are a great many other edible species of mushrooms belonging to other genera. Among them are the horse-tail or maned agaric (*Coprinus comatus*), the ink caps (*Coprinus atramentarius*), and the glistening comatus (*Coprinus micaceus*). These have black spores; the cap does not expand, but remains more like a partly closed umbrella. When old, these species become very watery and dissolve, forming a black, inky fluid. For eating they should be taken only while young. The parasol fungus (*Lepiota procera*) is a white-spored edible mushroom rather abundant in grassy places. It is rather tall on a slender stem. The cap is whitish or light brown and covered with coarse scales. The ring is free and not fastened to the stalk. Another highly prized species is the chanterelle (*Cantharellus cibarius*), an egg-yellow species common in moist woods. The cap has an irregular, crumpled margin, is more or less depressed on the upper surface, and has shallow, blunt gills prolonged down the stalk. The fairy ring fungus (*Marasmius oreades*), common in lawns and meadows, is also edible. There are some species having the same habit of growing in circles, that are reputed poisonous.

The edible ones are white-spored, have hollow stalks, and are seldom more than two inches across the pale yellow or drab cap, which is often concave on top and raised in the centre. One class of gill-bearing fungi exude, when broken, a milky juice. The species of this kind belong to the genus *Lactarius*. Some have a very acrid juice, but one (*Lactarius deliciosus*) is considered very choice by mushroom lovers. It grows in damp woods in mountainous regions, but is not common in lowlands. It cannot be mistaken for any injurious species, as the milk exuded by it is always red with a tinge of orange, and slowly changes color to greenish. The fungus is a little lighter in color than the milk exuded by it.

Boletus is one of the most common genera. The species are rather difficult of identification and should not be eaten by a novice. Some of the *Gasteromycetes*, for example, the puffballs (*Lycoperdon giganteum* and *Lycoperdon cyathiforme*), are common edible species. The former attains a diameter of ten inches or more; has a smooth, white, kid-like surface when young, with a firm white or pale yellow flesh. The other is six inches in diameter, flattened and tessellated on top, and contracted at the base. In color it varies from white to brown. The puffballs should be taken while young and before the spores are developed. One species (*Scleroderma vulgare*), related to the ones just described, and suspected of being injurious, may be recognized by its tough, hard, yellowish-brown, warty exterior, and purplish-black interior mottled with white. Among the most highly prized of all the edible fungi are the morels and truffles (*Tuber melanosporum*).

Since several species of mushrooms have not yet been proved harmless and since occasional cases of poisoning are still attributed to their use as food, the following rules, formulated by Farlow, are given as guides for the inexperienced collector: "Avoid fungi when in the button or unexpanded stage; also those in which the flesh has begun to decay even if only slightly. Avoid all fungi which have stalks with a swollen base surrounded by a sac-like or scaly envelope, especially if the gills are white. Avoid fungi having a milky juice, unless the milk is reddish." These rules are not absolute, because there are exceptions to them, but are safe for the novice to follow. See FUNGI, EDIBLE AND POISONOUS.

MUSHROOMS AS FOOD. Since mushrooms and other edible fungi are often said to be nutritious food, to contain large quantities of protein, and to rank close to meat as sources of nitrogenous material, extravagant statements have been made concerning them. When fresh, mushrooms have the following percentage composition: Water, 88.1; protein, 3.5; fat, 0.4; nitrogen-free extract, 6.0; crude fibre, 0.8; and ash, 1.2. Other edible fungi closely resemble them so far as analyses have been reported. Like all green vegetables, mushrooms have a high water content in proportion to their bulk, and as regards protein content, they rank about the same as potatoes, to which they are decidedly inferior in food value, since they contain much less carbohydrates, and the nitrogen present is largely in the form of non-albuminoids, which are thought to have little food value. The numerous studies which have been made show that mushrooms are not thor-

oughly digested. Recent experiments show that 25 to 59 per cent. is indigestible. See Plates of EDIBLE AND POISONOUS FUNGI.

Y., 1900); Badman, *Treatise on the Esculent Funguses of England* (London, 1863); Cooke, *Edible and Poisonous Mushrooms* (London, 1894); Dallas and Burgin, *Among the Mushrooms* (Philadelphia, 1900); Falconer, *How to Grow Mushrooms* (New York, 1892); id., *United States Department of Agriculture, Farmers' Bulletin 57* (Washington, 1897); Farlow, "Some Edible and Poisonous Fungi," *United States Department Agricultural Yearbook* (Washington, 1894); Gibson, *Our Edible Toadstools and Mushrooms* (New York, 1895); Palmer, *About Mushrooms* (Boston, 1894); Peck, *Mushrooms and Their Uses* (Cambridge, Mass., 1897); Smith, *Mushrooms and Toadstools* (London, 1879); Robinson, *On Mushroom Culture* (ib., 1870); Hussey, *Illustrations of British Mycology* (ib., 1855); Taylor, *Student's Handbook of Mushrooms of America* (Washington, 1897).

MUSHROOM GNAT. The name given by mushroom growers to any of the fungus-gnats of the family Mycetophilidæ. (See GNAT.) These are small, mosquito-like creatures with feathered antennæ, and frequent, as a rule, vegetable matter or fungi, upon which their larvæ feed. The larvæ are slender, white, wormlike creatures, with a distinct black head. The larva of one species of the genus *Sciara* is especially injurious to mushrooms, which it eats into and ruins. In mushroom cellars, fumigation with tobacco or pyrethrum will kill the flies.

MUSIC (OF., Fr. *musique*, from Lat. *musica*, from Gk. *μουσική*, *mousikê*, music, from *μουσική*, *mousikos*, relating to the Muses, from *Μοῦσα*, *Mousa*, Muse). ORIGINS. Music is a mode of motion. It is a modification by art of aerial vibrations, whose impact upon the auditory nerve makes mental varying images. Sound, the raw material from which music is fashioned, is produced by motion.

Matter is the stimulus; sensation is the result. "The kind of motion, however, that goes to produce sound is not that of matter precisely, but rather of the molecules or ultimate particles of which matter is composed. When the state of equilibrium of an elastic body is disturbed by a shock or by friction, it tends to regain its condition of equilibrium, but does so only after a greater or less number of vibrations, or oscillating movements, of the molecules of which the mass of the body is composed." Thus J. A. Zahm, a profound investigator in acoustics and a follower of the great Helmholtz, whose masterly tonal researches are set forth in his *Die Lehre von den Tonempfindungen*. The nature of sound, Lord Bacon observes, "in general hath been superficially observed. It is one of the subtlest pieces of Nature." The nineteenth century has endeavored to wipe away Bacon's reproach, for the studies and experimentings of such men as Helmholtz, Rudolf König, and others have lifted into light the darkest problems of acoustics. The latest researches teach us that sound vibrations—vibrations audible to the ear—have a rapidity which ranges from 16 to 36,500

per second. Heat vibrations begin at 134 trillions per second; light vibrations, visible to the eye, at 483 trillions. The gamut of the rainbow has its velocity measurements. Chemical vibrations, "shown only by certain reactions in prepared photographic plates," are beyond our sense perceptions. Sonorous vibrations, then, are really the slowest of all. Dr. William Ramsay asserts in his *Essay on Smell*, that the sense of smell is excited by vibrations of a lower period than light and heat. Sounds of a musical character rarely extend beyond a minimum of 16 and a maximum of 4138 vibrations, respectively the rates of vibration of the lowest tone of an organ with a pipe of thirty-two feet and the top note of a piccolo. The production of sound, its transmission, and its aural perception may all be demonstrated with a long piece of stretched string. In its position of equilibrium it represents a straight line; pluck it and its elasticity will cause it to return. This is a simple vibration. But the string also goes in the opposite direction, and this is a double vibration. Like a pendulum, the vibrations of the string are isochronous, each occupying exactly the same length of time. By shortening the string or increasing its tension we get vibrations of various velocities, and the ear perceives various pitches from 16 vibrations to the second up to 4224 vibrations. Increase the tension beyond this point, shrillness results, below 16 a dull unmusical whirring. The same results acoustically may be produced with pipes of varying lengths. The vibrations are, as in the case with strings, isochronous; they vary in rapidity according to the length of the pipe; subdivide them and harmonics are produced. Notes and vibrating segments are the crude material of music; pitch, force, or loudness, and timbre or quality of tone. All these qualities depend upon the rapidity of the vibrations. It is demonstrated: that the number of vibrations of strings is inversely proportional to their length; that the number of vibrations of strings is in inverse ratio to their diameter; that experimenting with two wires at tension, but of differing density, we get the rule that the number of vibrations of a string is inversely proportional to the square root of their density; finally, as Helmholtz shows by varying the stretching weight, that the number of vibrations of strings is directly proportional to the square root of their stretching weights. Thus the longer, thicker, heavier a string is, the slower are its vibrations; the deeper is its tone. The shorter, finer, lighter, tenser it is, the more rapid are its vibrations; the higher is its tone. Now the sound produced by a string vibrating its entire length is its fundamental or natural tone. It can produce many other sounds at the same time, subdividing them as it vibrates; there are the overtones or harmonics, partial and concomitant sounds. The series of harmonics theoretically may be divided infinitely, but for musical purposes they are numbered in accordance with the number of vibrating segments or loops. The notes exceed by one in number the loops—taking the ends of the tense string as nodes. The fundamental vibrating with one loop is the first harmonic of the tone, and the harmonics on the numerical order are constantly nearer and nearer together, the successive intervals being an octave, fifth, fourth, third, second. We are at the very beginnings of the scale. The clay is ready for the musical

sculptor. Mersenne's law is that the loudness of sound varies inversely as the square of the distance of the sonorous body from the ear. So the range of audition is over eleven octaves, but this is for an exceptional ear.

Musical sounds differ from each other in loudness, in pitch, in quality. Biot says "all sonorous bodies yield simultaneously an infinite number of sounds of gradually increasing intensity." This phenomenon is similar to that which obtains for the harmonics of strings, but the law for the series of harmonics is different for bodies of various forms. May it not be this difference which produces the particular character of sound, called timbre (*Klangfarbe*, clang-tint), which distinguishes each form of body, and causes the sound of a string and that of a vase to produce in us different sensations? May it not be owing to the diminution of the intensity in harmonics of each series that we find agreeable certain concords that would be intolerable if produced by sounds equally loud? And may not the quality of each particular substance—of wood or metal, for instance—be due to the superior intensity of one or another harmonic?

We have now some dim idea of the natural laws which give us force or loudness, pitch, and quality in music. The whole subject in all its fascinating range and variety is admirably treated in Zahm's *Sound and Music*. Therein may be learned much about the production and transmission of sound, its velocity, reflection, refraction, resonance, and interference. Of pitch it may be only said here that its standard in music is the A string of the violin, which gives the tuning note for orchestras. It corresponds to A₄ above middle C of the pianoforte. A₄ as a vibration number of 435 was chosen in 1859 as a standard pitch. This is called the French pitch and its exact vibrations are really 435.45. It is the standard pitch of our orchestras, and since 1892 for all pianofortes. (See PITCH.) All the modifications of sound made by the ingenuity of man in his inventions of string, wood, brass, pipe—as in the organ—and percussion instruments, from the drum to the piano, give us variety in tonal timbre and are based on the human voice, which with its bass, tenor, alto, and soprano served as a model for the viol family.

Helmholtz has considered the analogies of light and sound, both being modes of vibratory motion. In his psychological optics, he gives the following analogies between the notes of the piano and the colors of the spectrum:

F. End of the red
g. Red
g. Red
A. Red
A. Orange-red
B. Orange
C. Yellow
C. Green
d. Greenish blue
d. Cyanogen blue

E. Indigo blue
f. Violet
f. Violet
g. Ultra-violet
g. Ultra-violet
a. Ultra-violet
a. Ultra-violet
b. End of the solar spectrum.

Upon this laboratory experiment some imaginative theorists have endeavored to rear a system of musical aesthetics, but unsuccessfully, though we have come to speak naturally of color in music. Tone and color, while related, as are all things mundane, are far asunder in terms of art. As the receptive organ of tone and its transmitter to the brain, the ear plays as important a part as tone itself. Without it there would be no music, paradoxical as it may sound,

for it is the eye that perceives, the ear that hears, the hand that feels, which give us our picture of the world. Under this hypothesis the world then is idea, idealists and materialists meeting amicably on the little strip of territory called sensation. The complete apparatus of the ear, the wonderful 'lute of three thousand strings,' called the cortical fibres after their discoverer Corti, should be carefully investigated by the student. We may now truthfully affirm, after briefly studying the production of sound and its modifications by instruments, that music is a mode of motion.

But music as a pleasure-evoking emotion! Whence comes it, what is its psychologic basis? It is purely human, for not the most fanciful of poets or extravagant of psychologists can torture into formal beauty the songs of birds, the growling of the tempest, the sound of the sea. All these things and many more may furnish the starting point, the spring-board of the composer's imaginings, but artistic they are not. There is no real music in nature. As a play impulse, art has been considered and discussed by many modern writers. Schopenhauer, whose intuitions are often superior to other men's logic, calls art "a momentary liberation," and Herbert Spencer develops his idea, linking it with biological conditions. In his *Principles of Psychology* he says that a characteristic of nerve processes is that the superfluous integration of ganglion cells should be accompanied by an inherited readiness to discharge. Thus the 'aimless activity' we call play is the result of a force expended, a force that man as a highly developed animal has more of than is needed for the struggle of existence. In many animals he finds imitation a factor, but Karl Groos in his *Play of Man* believes in impulse and intuition—"the inherited impulse toward prescribed reactions in certain brain-tracts seems to be in itself a sufficient cause for play without the necessary accompaniment of superfluous energy." Schiller calls play a harmless expenditure of exuberant strength which is its own excuse for action. Lazarus is the exponent of the reaction theory. When we are tired of natural or physical labor we play, thus recreating ourselves. Professor Groos, however, finds in both the surplus expenditure and the recreation theories only partial statements of the truth. For him, play is the impulse toward repetition, and this is a physiological reason for playing to the exhaustion point, which we notice so often, even if we are tired at the beginning. "Let us recall first," he writes, "the tremendous significance of involuntary repetition to all animal life, for just as the simplest organisms in alternate expansion and contraction and the higher ones in heart-beats and breathing are pervaded by waves of movements, so also in the sphere of voluntary activity there is a well-nigh irresistible tendency to repetition." Play, too, furnishes distraction from quotidian cares. It is an educational factor of prime importance, elaborating immature capacities and influencing the evolution of hereditary qualities. Schiller declares that man alternates between weak and sensuous pleasures, and his dictum that man is fully human only when he plays has, as Professor Groos declares, "definite biological meaning." Conrad Lange defines art "as the capacity possessed by men of furnishing themselves and others with pleasure based on conscious self-illusion,

which by widening and deepening human perception and emotion tends to preserve and improve the race." This is but an amplification of Schiller's remark. And Art is but the play-impulse immeasurably elevated, yet at its roots possessing a sham objective character. The earliest form of musical art, the pantomimic dance, was "an expression of muscular force simulating the acts of life." It was symbolical, it expressed a feeling, a state of mind. In its genesis art was play of a semi-physiological character. Primitive dancing comprised music and poetry in solution; later on they became separate and independent arts. Rhythm, the father of organized music, played a big rôle, for rhythm is cosmic, it is manifested in the heart beat—the unit of measure for all the temporal arts—the tides and the movements of the bodies in the interstellar depths. Dancing accompanied by rudimentary songs—perhaps of only two or three tones—is the first step of the musical art. Emotions were translated in the rough, yet effectively; the pantomime of the savages is always clear, attempting as it does the expression of love, anger, terror, hatred, and happiness. How much the sexual attributes play in the beginnings of art we cannot say, but music in the light of modern researches may no longer be called the Heavenly Maid. Far from it, indeed, for as Havelock Ellis truthfully says: "In music the most indefinite and profound mysteries are revealed and placed outside us as a gracious, marvelous globe; the very secret of the soul is brought forth and set in the audible world. That is why no other art smites us with so powerfully religious an appeal as music; no other art tells us such old forgotten secrets about ourselves. It is in the mightiest of all instincts, the primitive sexual traditions of the races before man was, that music is rooted. . . . The sexual instinct is more poignant and overmastering, more ancient than any as a source of beauty. . . . Beauty is the child of love." Music is an emotion become æsthetic. Human beings, as Ribot says, began by thinking that beautiful which resembled themselves. Primitive art was addressed to the individual of our own species. As it became more disinterested, it exhibited religious qualities, and eventually was transformed into a ritual, a ceremony for the expression of awe or thankfulness to the deity. It had a specific character and one that had but remote affiliations with our modern conceptions of art. The natural extrusion of sympathy, the conquest of nature by the intellect, has given us two of the most modern arts: music and landscape painting. Neither of these had any real existence in the Old-World civilizations; indeed, a feeling for nature in poetry and painting may be said to date from yesterday. The patient flowering of savage, rhythmic cries into the score of a Beethoven symphony is only comparable—to mention purely human processes—to the evolution from a South Sea Islander's simple mud hut to the magnificent complexities of a Gothic cathedral. From the sheltering needs of the body comes the noble art of architecture; from the social needs of intercourse, self-expression, come poetry and music. Both were the irrepressible and the irresponsible exhibition of surplus energy, of the play impulse. And on this side is music purely sensuous.

Kant defines the Beautiful as that which

"through the harmony of its form with the faculty of human knowledge awakens a disinterested, universal, and necessary satisfaction." We are now another remove from the utilitarian; for in a certain sense all art is useless, inasmuch as it bestows no material benefits. Its beauty is its excuse for being, and music being the least representative of the arts, copying no material forms, is therefore easily the most ideal of all the arts and the most inutile. Apprehended in time and not in space, it addresses itself to the imagination. And here we are confronted by the *crux* of Hanslick and other æstheticians of the formal. "Definite feelings and emotions are unsusceptible of being embodied in music," he declares. Music does not express emotion, it expresses itself. It is sound-play; it consists of exquisite arabesques; it is a formal pattern of tone, and all the wonderful things attributed to it exist only in the overheated imagination of its hearers. Precisely so, and it is this almost miraculous subjectivizing process that proves the weakness of Hanslick's thesis. No other art attacks so powerfully the emotions. "Music acts like a burn, like cold, heat, or a caressing contact. Music acts on the muscular system, on the circulation, the respiration . . . and is the most dependent on physiological conditions. The primary effect is a physical one." Beauquier says: "Musical vibration is only one particular mode of perceiving the universal vibration. . . . Musical art is the art of sensibility par excellence, since it regulates the great phenomena of vibration into which all external perceptions resolve themselves, and transfers it from the region of the unconscious, in which it was hidden, to that of consciousness." Again Ribot: "While certain arts at once awaken ideas which give a determination to the feelings, music acts inversely. It creates dispositions depending on the organic state and on nervous activity, which we translate by the vague terms—joy, tenderness, serenity, tranquillity, uneasiness. On this canvas the intellect embroiders its designs at pleasure, varying according to individual peculiarities." Let us admit, then, with Hanslick and the formalists that music does not *express* emotion; yet this does not preclude the idea of an emotional content in the listener, who projects his personality into the forms. In music the forms and the subject are identical; we cannot dissociate the pattern of the love theme in *Tristan und Isolde* from its emotional effect. The sound once set in motion, we are at liberty to dream, to thrill, to weep, to sigh with all the moods superinduced by a master. And this playing upon our nerves, our imagination, is intentional. In modern times music has become an instrument of overpowering emotional significance. Eighteenth-century music with its gay scheme of decoration, its pretty recurring patterns, its play of forms, and its freedom from the overwrought, the intense, can well be utilized by Hanslick as an example of music for music's sake. It expressed little in the latter-day connotation of the word; so to modern music, especially Beethoven, we might truthfully give the title of classic, as it fulfills many of the requisites of antique art; its dignity, symmetry, grandeur, and profound emotional quality. The position of the formalist school is based on a half truth. A study of the nature of emotions would have cleared the ground long ago of incumbering verbalisms. Ribot de-

finer the technique of an emotion thus: "First an intellectual state, then organic and motor disturbances, and then the consciousness of these disturbances, which is the psychic state we call emotion." This clear definition of a very complicated process may be applied to the effects of music upon a sympathetic listener—naturally sympathy must be granted, else all music addresses itself to the deaf. A vast mirror of subjectivity, music appeals to each of us according to our temperaments. It paints upon the background of our consciousness enlarged meanings of ourselves. Composed of alternate sound and silence, it reaches our very soul with its rhythmic pulsings and sensuous qualities. It is at once the most impersonal and most personal of all the arts. It traverses the keyboard of our desires and arouses noble ambitions or sensual crises as well. It is an unmoral art; it can be impressed with equal facility in the service of church or tavern. Its very plasticity makes it an agent for evil and nevertheless a powerful aid to worship. It is because of this easily molded nature that music has served in every camp, has gone to the wars, has sounded the psalms of peace, has been the bone of contention between warring schools and factions, has led the bride to the altar, and intoned the grief for the dead one. Music, in some form or other, has always accompanied man on his march through the ages, tracing in spiritual mimicry his evanescent emotional gestures. Captive to his baser senses, a column of smoke by day, this agile protean art has played the pillar of flame, a burning eloquent sign in the darkened skies of revolt, superstition, and misery. A potent symbol, 'a mighty fortress' during the Middle Ages, music served the Church faithfully, and when enfranchised it has as faithfully recorded the great emotions of secular souls. Ariel and Caliban—to what purposes has this versatile art not been put? At first man played upon a reed to his mate; then he grew in love with his tune for its own sake. To-day, after putting the art through all its probable paces, it has been harnessed to the Drama, and, from being the exponent of pure, formal beauty, it is pressed into the service of the Characteristic. The Chinese, thousands of years ago, discovered the charm of ugliness, and it would seem that modern music is striving for that goal. Rosenkranz has written a volume on *Aesthetics of the Ugly*, and in the general hurly-burly, topsy-turveying of the arts, it would not be improbable if music played the part of devil's advocate in the new æsthetic dispensation. The line of demarcation between the beautiful and the ugly is slight, for beauty is a relative quality, and ugliness often proves its capital foil. To show how shifting has been the standard of musical beauty one has only to consult history or personal memories. A decade may transform the musical map, deposing reigning monarchs and elevating to the purple the veriest newcomer. Music is a fickle goddess.

How far symbolism may be pushed in music is seen in the attempts to pin down the phrase to precise meanings. It is true that there is a key-symbolism, that not by chance have the great composers selected certain keys—keys that, in Wordsworth's happy expression, are inevitable. Beethoven's Fifth Symphony is inconceivable in C sharp minor or E flat minor. C minor is a portion of its life. Berlioz has compiled a table

of key characteristics and a certain theorist does not hesitate to call F major rugged; B major, energetic; E major, radiant, warm, joyous; A major, frank, sonorous; D major, gay, brilliant, alert; and so on through the list. Here again temperament counts, all else is purely arbitrary. Music has the power of evoking moods, that is a common experience; and it has on the formal side analogies to architecture, for it is structural, it is architectonic, and its subject is imitative of no known model. This has led Walter Pater to asseverate that all the arts in common aspire "toward music, music being the typical or ideally consummate art, the object of the great *Anders-Streben*—reaching forward—of all art, of all that is artistic or partakes of artistic qualities." It is "the blending of the animative thought and embodying vehicle," the absorption of the matter into the form of which music is the one perfect example among the arts, that attracted Pater. "All art constantly aspires toward the condition of music," he wrote, and made of sensual presentation, emotional suggestion, and technical perfection the archetype for all the arts. The danger of this view lies in the slighting of music's tremendous evocation of our subliminal depths, of spiritual shades. These cannot be exorcised by technical loveliness or richness of emotional eloquence. Beethoven has taught us in his symphonies that from tone may be wrung almost an ethical meaning. The Platonic theory of an ideal type for all the arts could not have failed to impress Pater. But it stops at the outer porches of the ear, the tone which should penetrate to the inner sanctuary losing on the way some of its grosser connotations. His doctrine is that art is always striving to be independent of mere intelligence, that the vaguer the subject the greater the impact of the thrill upon our souls. Gustave Flaubert, who is the creator of both the realistic and the symbolistic school, had some such idea; for he wished his prose to be as independent as music, to float in mid-air by reason of its euphony and rhythm. And there can be no doubt that it is the perfect balance found in Beethoven's phrases, both the meaning and the music, that makes of them the greater type for all future symphonists. Poetry is the usual standard for painter, poet, sculptor, and composer, and, as John Addington Symonds shows, this is as much of a heresy as Pater's. F. W. H. Myers writes: "The range of human thoughts and emotions greatly transcends the range of such symbols as man has invented to express them; and it becomes, therefore, the business of art to use these symbols in a double way. They must be used for the direct representation of thought and feeling, but they must also be combined by so subtle an imagination as to suggest much which there is no means of directly expressing. This power gives birth to the art of the musician, whose symbols are hardly imitative at all, but express emotions which, till music suggests them, have been not only unknown, but unimaginable." To each art its particular province. There is music in Milton; Wagner is a great painter; Bach an architect; and through the marmoreal prose of Flaubert rings the sound of the sculptor's chisel. But this 'reaching forward' is, as Symonds says, "at its best a way of expressing our sense of something subjective in the styles of artists or of epochs, not of something in the arts themselves." The subjectivity of a critic

prompts him to select a particular art as the type for all. Wagner, in a superb effort, attempted to house all the arts within the walls of a mighty synthesis. Music, however, won the victory; it is Wagner the composer who will live, not Wagner the dramatic poet or Wagner the scene painter. The intellectualists are quite as wrong in their endeavor to force upon music the office of preacher or philosopher. By reason of its limitations, music is not well adapted for the expression of an intellectual content. It gives us the maximum of sensuous effect, though we do not agree with Symonds that in it is the minimum appeal to the intelligence. If this were so, Bach, Beethoven, Chopin, Brahms, Wagner, Richard Strauss would not be in the same category with Dante, Michelangelo, Milton, Shakespeare, Shelley, Swinburne, and Rodin. Besides, has not Spencer said, "The emotions are the masters, the intellect is the servant"? Great intellectuality, great emotional temperaments go to the making of great composers as well as of great architects, poets, dramatists, painters, and sculptors. Architecture is not emotional like music, but it is more concrete, it arouses the sense of the sublime—which music does, too, under certain conditions. Sculpture is impressive in its symbolism of the human form and its evocation of harmonious lines; of all the arts it is the most unlike music. Painting, with its illusions of life on a flat superficies, has certain affinities with music, while music and poetry have several qualities in common—the subtleties of sound and the power of continuous narration—though here music speaks a tongue not to be translated into words. It gives the sense of situation, not action, the prism of the arts, as Symonds phrases it, "each distinct, but homogeneous, and tintured at their edges with hues borrowed from the sister arts. Their differences derive from the several vehicles they are bound to employ. Their unity is the spiritual substance which they express in common. Abstract beauty is one and indivisible. But the concrete shapes which manifest this beauty decompose it, just as the prism analyzes white light into colors."

We have rapidly surveyed music on its acoustical, psychological, and æsthetical sides; there remains the evolutionary. From a mere cry in the submerged, prehistoric world it has passed into the daily life of man, a magnificent art work in which the spiritual and the sensuous are harmoniously blended or struggle for precedence. A presentative art, it has nevertheless been made representative in the acoustic parallelisms of Richard Wagner and others. Furnishing the motive power for ballets, music is the handmaid of religion, and by some authorities is considered to have therapeutic powers. In history it has figured as a healer of sick souls, and to-day in its loftier manifestations it is a balm and a stimulant to the weary in mind and body. And in the last analysis is not music an aural mode of motion?

EVOLUTION. The history of musical art is an effort to record, to systematize and bring into general harmony a vast mass of hopelessly intractable material, conflicting facts, many *lacunæ* and irreconcilable traits which try the temper of the most ardent historian. Evolution there has been, and, despite pessimistic doubts, genuine progress; but it is an evolution that often curves in upon itself, its line of progress is more fancied

than real. To draw a straight line from the earliest musical lisping to the omnipotent utterances of Beethoven, is the ideal of the critic; but the task is a difficult one. Musical history is a history of suppressions, evasions, and empirical classifications. Like the evolutionary processes in the physical world, progress is often seemingly crab-wise. If science aims at discovering law and reason in nature, a notation of the actual, the art of music furnishes an example of purely arbitrary progress. The artist does not create in the abstract, but in the concrete, so that two art products are independent and never alike. To explain one by the other is at once the cardinal fault of criticism and its excuse for existence. Palestrina and Wagner are poles asunder, and it is a bold man who claims precedence for either. And yet nothing of Palestrina's has been lost; his harmonic seeds are come to a flowering. Has Wagner surpassed Gluck in certain elementary qualities? Who since the death of Beethoven has symphonized so marvelously? Has the rush and sweep of the Handelian chorus ever been repeated, or who can equal Bach in polyphonic mastery? Music is the youngest of the arts, but it behooves us to ask if the nineteenth century is literally its seminal epoch. So there have been factitious groupings, vague theorizing by some compilers of musical history, who, be it said with emphasis, have made much of tantalizing, incomplete records. To be sure, schools usually followed the strong men, and there is a chain of development during the past few hundred years, enough to furnish credible criticism. Before that the roots are in the darkness of the mother churches, or the mediæval twilight of the cloisters. There has been much sublime guessing to build up a fabric capable of withstanding adverse comment. But it has been accomplished, and in Naumann, Ambros, Wallaschek, Rowbotham, Grove, Rockstro, Parry, Henderson, Finck, Apthorp, Hale, Krehbiel, Elson, Ernest Newman, Hadow, and others we may catch glimpses of a baffling whole. One fact is unalterably demonstrated by the researches of these scholars: that so far from music being a universal language, it is more subject to geographical limitations than is speech. It is a veritable tower of Babel in its multitudinous dialects, its jargons and eloquence. The divine stammering of the men who made ecclesiastical music is offset by the heathenish rhythmic howlings of the Bushmen; and the melancholy monotony of the Chinese pentatonic scale is drowned by the full orchestra of Tschaikowsky. Men of many climes may converse by mute signs, but set them all to music-making, each after their kind, and the result will be anarchy. It is one of the pleasing fancies of the poet, this catholicity of music. Facts, however, contradict the idea; just as surely as they deny the assumption that vocal music, i.e. words with song, is superior to absolute music, i.e. music that is self-sufficient, that needs no illustration, no libretto to explain its existence. Absolute music then is the highest reach of the art, the most dignified and satisfying. No doubt the human larynx is the most perfect of instruments, and the sound it produces touches the heart, for it is human. But poetry pure and music absolute cannot be blended without a loss to both. Vocal tones preceded instrumental ones; indeed, one school asserts that singing came before speech. Grell and Engel main-

tain that speech is but degenerated singing and that music with words is the archetype of the art. Music and articulate speech are far from resting on a common basis, though both begin at the human throat. Half the heresies of music originate in this confounding of widely disparate things. It was a stumbling block for Beethoven, Richard Wagner, and for Schumann and Richard Strauss. Even among the savages the break is clear between impassioned speech and song.

Rowbotham ingeniously groups prehistoric music under the drum, pipe, and lyre types; instruments of percussion, wind, and string. Man drummed and thrummed before he piped, and he piped before he plucked, and he probably yowled to the moon before the rhythmic noises of nature, dripping of waters, sounds of wood and wind, stimulated his phono-motor centres to imitation. (See MUSICAL INSTRUMENTS). The rhythmic chantings were part of a ritual, the soul of the savage worshipped its fetish; the beginnings of religion and art are identical. These manifestations belong properly to culture study. (See FOLK-MUSIC; see also the Music of Arabia, China, Egypt, India, Japan, Turkey, Russia, Scandinavia, of the Magyars, Celts, Negroes, North American Indians, and Hebrews, under ARABIAN MUSIC; CHINESE MUSIC, etc.) The earliest musical system of which we possess any authentic record was invented by the Greeks or rather absorbed from Phœnician and Egyptian systems. The Hebrews also borrowed their forms from other nations. The invention of the lyre is attributed to the Egyptian god Thoth in the pretty fables. The Greek play is the prototype of modern opera. (See OPERA.) It was sung, though the music has not been vouchsafed us. Two thousand years ago Athens thrilled at the *Antigone* of Sophocles, yet not a note of it has been preserved. The Greeks, sensitive to all the arts, made music part of their daily lives. Its influence upon them, as described by poets, must have been extraordinary. Yet in the three hypothetical Hymns of Apollo, Nemesis, and Calliope, and the first Pythian Ode to Pindar, we find little that would touch modern nerves. Theoretical writings of Pythagoras, Aristoxenus, Euclid, and others have come down to us and show that the Greek knew the perfect intervals of the natural scale—the octave, fourth, fifth, and greater tone. But their system is a highly artificial, needlessly complicated one, and finally blossomed into the modes: Dorian, Ionian, Phrygian, Æolian, Lydian, Mixolydian, etc. (See GREEK MUSIC; MODES.) The Romans derived their musical knowledge from the Greeks, but did not pursue its study seriously. The early Christians who found in the Imperial city a harbor of refuge brought with them new forms, echoes of the liturgy heard in the Temple of Jerusalem. Saint Ambrose, Bishop of Milan, made about the year A.D. 384 a general collection of these melodies and at the same time laid down a code of technical laws. Two centuries later Saint Gregory the Great is said to have made a second collection (c.590 A.D.) and based it on a more comprehensive system. The four modes or scales bequeathed by Ambrose were increased to nine. The combined melodies received in early times the names of *cantus planus*, plain chant; the older being known as the Ambrosian Chant (q.v.)—still sung in Milan—the later one as the Gregorian Chant (q.v.). (See PLAIN CHANT.) From

these liturgical chants has sprung the noble music of the Roman Catholic Church. Gevaert doubts with historic accuracy the historic basis of the Gregorian chants; believing that the Christian Church derived its modal scales and its melodies, not from the old Hebraic psalmody, but from the secular *Kithara* song of the Roman Empire, which comes from the Greek. These psalm tunes, whatever their origin, are the oldest ecclesiastical music we possess. Later music was treated as arithmetic by Boëtius and the art became a mere mathematical exercise. In the latter half of the ninth century Huchald, a monk of Saint Amand in Flanders, proposed a new division of tetrachords, and attempted the arrangement of vocal music in parts, and invented a new system of notation. Semiography or sign writing was the method of notation that superseded the notation of Gregory. Figures called Neumæ (see NEUMES) were placed over the words to which the tunes were sung. Though the ascent and descent of the melody were not at first shown, Huchald remedied that by a series of horizontal lines arranged like the modern staff. The *Musica Enchiriadis*, which was until lately ascribed to him, contains information about notation and the Organum or Diaphony, which was the first form of harmony, consisting chiefly of consecutive octaves, fifths, or fourths added to the plain song of the church. (See HARMONY.) Guido of Arezzo (c.1000-c.1050), another monk, distributed the twenty notes then used into groups of six, called hexachords. He invented solmization (q.v.), which is the naming of the notes of each hexachord by the syllables Ut, Re, Mi, Fa, Sol, La; the origin of these syllables being a verse of a hymn to Saint John, each hemistich of which began with one of them, and was sung to phrases a note higher each time. Ut was supplanted by Do, and Si was added to complete the necessary seven notes of the octave. (See SCALE.) Franco of Cologne made the first recorded attempt to measure the relative length of notes in his 'cantus mensurabilis' or 'measured song.' Four standards of length were adopted: (1) *maxima*, or *duplex longa*; (2) *longa*; (3) *brevis*; (4) *semibrevis*. A time signature was put at the beginning of the music, which showed whether each long note was to be equal to two or three shorter ones. (See MENSURABLE MUSIC.) Diaphony merged into discant; the former doubling the melody at the fifth or fourth, the latter varying the monotony of the organum by the addition of ornamental notes, passing notes. This discant was usually extemporaneous, though composers soon employed it, when it was called 'contrapunctus a penna,' in contradistinction to 'contrapunctus a mente.' Counterpoint, or note against note, was born; motets were sung, rough attempts at part-singing lent it at least a beginning. See COUNTERPOINT.

Much of the musical development of the twelfth and thirteenth centuries was centred in Paris. The troubadours, trouvères, jongleurs, and minnesingers, who cultivated poetry and music, play no small part in the advancement of the art. They developed epic, lyric, and dramatic art, and spread over France, Germany, even the south of England. Some of the better-known were Thibaut, King of Navarre, Count of Champagne, Adam de la Hale, who wrote *Robin and Marion*—a play with music and dialogue interspersed—and later Walther von der Vogelweide, Wolfram von

Eschenbach, Frauenlob, and Hans Sachs. England gives us the round 'Sumer is icumen in' (see RONDO), and there are fragments of works by Marchault de Muris, Tunstede, and De Handlo in the fourteenth century which are not promising examples. The Netherlands in the early part of the fifteenth century showed signs of re-awakening energy, the first representative composer being Dufay, in the service of Philip the Good of Burgundy. His style was crude, showing the influence of John Dunstable, an Englishman (c.1400-1453), who at one time was regarded as the greatest composer in Europe. After Faugues, Caron, Busnois, the next figure of importance is Okeghem, who lived until 1513. He, too, was a Fleming. He is known to fame, however, as the master of Josquin Depres (born about 1450), a genius. He wrote church and secular music with equal facility and was in the Papal choir from 1471 to 1484. His pupils were Jean Mouton and Nicholas Gombert. Obrecht, chapel-master at Utrecht, was another man of ability. The art of printing from music types was first practiced in the early part of the sixteenth century (1501). This led to an increased activity among composers, and soon came an interesting list of names, such as Adrian Willaert (1490-1562), attached to Saint Mark's Cathedral, Venice; Philip Verdelot (about 1500-67), composer of madrigals, canzonas; Jacques Arcadelt (c.1514-c.1575), and others. Constanzo Festa was the first Italian composer of prominence (1490-1545). But we must not forget other Netherland men, Jacques Clemens, Cyprian Van Rove, Walraent, Phillipus del Monte, and Orlando di Lasso (1520-94), who continued to write good music even after the Italian supremacy. Orlando di Lasso is famous for his setting of the Penitential Psalms, which contain much lovely and characteristic music. Then for a time the Italians, Zarlino, the two Gabriellis, Claudio Merulo (1533-1604), Marenzio, a great organist, and Palestrina held the field. The latter was born at the town from which he takes his name about 1514. He studied under Claude Goudimel, a Frenchman. The "Pope Marcellus Mass" was written in 1565, and in it the climax of ecclesiastical music was reached. Palestrina was the greatest master of pure choral style; he closed an epoch when he died in 1594. His contemporaries and pupils were Morales, a Spaniard; Nanini, Vittoria, also a Spaniard and second only to Palestrina; Giovanni Croce, and Allegri. In Germany, Heinrich Isaak, Johann Walther—the friend of Luther—Gallus, Stalzer, and Hans Leo Hassler (1564-1612), the latter a pupil of Andrea Gabrieli, passed on the torch of tradition, keeping it aflame by their own honest efforts. In England there was a musical activity that has not been paralleled since in the history of the nation. Christopher Tye, John Merbeck, Thomas Tallis, his celebrated pupil William Byrd, Edwards, Whythorne, Nicholas Yonge, Thomas Morley, Thomas Weelkes, John Dowland (1562-1626), Thomas Batesen, Orlando Gibbons (1583-1625), John Bull, W. Forster, Benjamin Cosyris, John Blow, wrote wonderfully sparkling, vigorous, and original music. All England sang their catches, roundelays, madrigals, motets, and the more cultivated played their virginal and lute music. Indeed, the beginnings of music for the clavichord, harpsichord, and modern pianoforte may be found in the literature of Byrd, Gib-

bons, Bull, and others. The school culminated in Purcell (1658-95). Whether because of Puritanical influences or the advent of the Italians and later George Frederick Handel, an overwhelming composer, certainly England has produced no other such original genius as Henry Purcell.

The currents of music now begin to run swifter, opera and oratorios absorbing the ears of the civilized world thanks to the work of Monteverde, Lully, Purcell, Alessandro Scarlatti, Lotte, Durante, Leo, Handel, and Bach. (See ORATORIO.) This article will in the main confine itself to purely instrumental music and its progress. The crudeness of the viol family was giving way to the finished specimens of Italian violin-makers' art, and with improved instruments came music of a better quality and wider range. (See VIOLIN.) The organ, which aided the growth of types of choral music, was now become a more highly differentiated instrument, and music *per se* was heard from its pipes. (See ORGAN.) The fore-runners of the pianoforte (see PIANOFORTE) were engaging the attention of composers, and the orchestra (see ORCHESTRA), from a simple gathering of heterogeneous instruments, many of them obsolete to-day, was gradually approximating its present size. Parry divides the history of instrumental music into three well-defined periods: the first extends from the early experiments in the fifteenth and sixteenth centuries up to the time of Bach; the second up to Beethoven; the third to the present day. Contrapuntal methods prevailed during the first; the second saw the development of pure harmonic forms of the sonata order, culminating in Beethoven; the third was marked by modifications of the form with greater freedom in contrapuntal devices, and the patent factor of orchestration playing a powerful part. There was much graceful, fantastic dance-music written for the clavichord and harpsichord by Purcell and Lully, while Chambonnières and Couperin composed what are now known as suites, then called *ordres*, composed of lively dance movements out of which the sonata grew. (See SONATA.) Cambert and Lully also wrote ballads with overtures. Both Couperin and Rameau (1683-1764) contributed excellent music for the clavichord, and, being supple performers, did much to advance the purely formal side of composition, while in their suggestive titles we see the humble beginnings of programme music. Organ-playing was growing apace, Gabrieli, Merulo, Sweelinck of Amsterdam, Reinken, Frescobaldi, Scheidt, Froberger, a pupil of Frescobaldi, Kerl, Pachelbel, and Buxtehude the Dane, all helping to rear the mighty fabric of fugue and sonata which culminated in Bach. In Italy, Amati, Stradivarius, and Guarnerius stimulated the genius of Arcangelo Corelli (1653-1713), who gave the world his sonatas and concertos for stringed instruments accompanied by harpsichord or organ. The first set of twelve were called "Sonata da Chiesa," the second set of twelve "Sonata da Camera." The first, patterned after the churchly form, was in four movements, and is a prototype of the modern sonata; the second is a dance suite, consisting of Allemande, Corrente, Sarabande, Giga or Gavotte. And the music, as we can testify to-day, is sweet, sane, and dignified. Then followed a gifted group of Corelli's pupils, Somris, Locatelli, Geminiani, Veracini, Vivaldi, and Tartini. Being virtuosi, they all helped to solidify the technique of their

instrument as well as of musical forms. Among the Germans of this period may be mentioned Von Biber (1638-98). Handel (1685-1759), busy as he was with opera, oratorios, and the fatiguing duties of an impresario in London, found time to compose suites for the harpsichord as well as concertos for organ, violin sonatas, and overtures for his choral works. He was hardly a path-breaker, for he followed obvious Italian models, though he stamped everything he wrote with the seal of his vigorous genius. Johann Sebastian Bach (1685-1750) was first and last the ideal organist; into its literature he poured the purest treasures of his extraordinary genius. A set of fugues, concertos, and toccatas (see CONCERTO; FUGUE) that have never been equaled, the richness of which is far from being exhausted, were given the world by this modest cantor of Leipzig, who still found time to compose the *Well-Tempered Clavichord*, that unique collection of forty-eight preludes and fugues for a clavier tuned in equal temperament, so that all keys are equally available instead of some being in particular tune in order that a few others might be so. (See TEMPERAMENT.) He also wrote the English and French suites and partitas for the clavier, as well as the Italian concerto and those delightful lessons, two-part and three-part inventions. On Bach's prodigality of utterance, the astounding variety and depth of his music, its science, its art, its formal beauty and emotional significance, there is little need to dwell now. The great Passions, the violin compositions, and the clavier and organ music, chorales and motets are a part of the world's most precious art heritages. His perfection, his inauguration, form the matrix of all latter-day music. He has influenced Beethoven, Schumann, Chopin, Mendelssohn, Wagner, Brahms, and Richard Strauss enormously. The orchestra of his days was still in an amorphous condition and he wrote for it as he did for other instruments, thoroughly, and as a medium for the expression of his ideas. Personality in music revealed itself with no uncertainty in Bach's case. Some of Bach's predecessors, Kullman, Matthesen, and Muffat, wrote sonatas and suites. Domenico Scarlatti (1683-c.1757), the son of Alessandro, wrote operas and church music, as did his father, but soon became the most famous harpsichordist of his day, the Liszt of the eighteenth century. His compositions show the expert virtuoso, and are remarkable for being the first works of the kind in which the fugue and dance are not essential. The key-grouping and arrangement of the movements, with phrasal repetition, set his music ahead of its time and link it with Mozart and the early sonata masters. Galuppi and Paradisi followed in his footsteps. Slowly the contrapuntal style gave way to the harmonic, the Italians simplified the scheme by writing luscious melodies with a slight accompaniment, and after Corelli (1653-1713) the decadence began. Tartini, Viotti, Rode, Baillet, all noble artists, continued the Corelli tradition. Bach's sons, Karl Philipp Emanuel and Johann Christian, were worthy descendants, though without his masterful grip. The former made the model for the sonata that Haydn followed, and Johann Christian wrote sonatas, symphonies, and operas. Symphonies (see SYMPHONY) had been attempted by Abel, Esser, Wagensail, but the form received its first shaping by Haydn and Mozart. Haydn (1732-1809)

began by studying the clavier sonatas of Philipp Emanuel Bach and ended under the influence of his one-time pupil Mozart (1756-91). The Haydn string quartets and some of his symphonies and piano sonatas are inimitable. Mozart polished the symphony during his short, crowded life, and left us such masterpieces as the E flat, C major, and G minor symphonies. On his way to Paris in 1777 he stopped at Mannheim, where Stamitz conducted the best orchestra in Europe. There he learned the possibilities of instrumentation. Mozart had the real color-sense, and his orchestral writing shows a feeling for the varying *timbres*, and a balance of the various choirs hitherto unsuspected. His orchestra was a more elastic and highly organized instrument, and it lent itself to the most complicated types of composition. The wood and brass choirs were individualized, and writing for the string quartet had reached a degree of perfection. The dexterity displayed by Mozart was not lost on Haydn, and some of it was reflected in the operatic composers who followed him, though it may be confessed that Gluck (1714-87), his great contemporary, benefited little by his novel researches; indeed, he possibly never went out of his way to hear the D major symphony, which is said to have been given in Paris while the composer of *Orfeo* was there. Nineteenth-century operatic composers like Weber, Berlioz, Meyerbeer, Wagner, and Verdi in his later years, were the first to concern themselves with the possibilities of orchestra color enhancing the dramatic situation or contributing atmosphere.

After Muzio Clementi (1752-1832), the Italian pianist, went into pianoforte manufacturing and presented to the world a pianoforte that could withstand muscular attacks, and give out a great volume of tone because of its hammers instead of jacks, he paved the way for the Beethoven pianoforte sonata. He did more. He wrote his *Gradus ad Parnassum*, a collection of studies in style and invention that are in the curriculum of every pianist and student to-day. His inventive skill gave to pianoforte technique many new figures, and his was the technical foundation for the Beethoven sonatas. He is truthfully the father of modern pianoforte music, and until the appearance of Liszt, his pupils, J. B. Cramer, the Irishman; John Field—who originated the Nocturne form—and others whose style he influenced, Dussek, Pleyel, Steibelt, and Moscheles, dominated the entire field of pianoforte playing. In Beethoven (1770-1827) classical music reached its apex, and romantic music—so called—had its birth. The greatest of symphonists, his influence, like Bach's, has permeated every department of music. A short-time pupil of Haydn, admired by Mozart, this gigantic genius seems to have included in his mighty symphonies and sonatas all that had been. In his early efforts we see Haydn, in his ninth symphony and last piano sonatas may be found the seeds that sprouted into the luxuriant forests of the Wagner music-drama, and gave birth to the dream-haunted imaginings of Chopin, Schumann, and Berlioz. Beethoven has been called the Homer, the Michelangelo, the Shakespeare of music. He has more affinities with the great Englishman than with the Greek or Italian. He is intensely human, and his temperament, hugely passionate and poetic as it is, is never the ruler of his noble intellect. Nature dowered Beethoven with

manifold gifts; gifts not only of originality, but of character. In the slow revolution of music, it may be remarked that the most original men are not always the elect; their very originality sometimes degenerates into the bizarre, and a splendid isolation is their fate. But Beethoven, with all his revolutionary instincts, began in a conservative manner, building on the foundations of his predecessors, keeping in the line of tradition. The bases of his tonal palaces are dug deep, but their towers pierce the very skies. His thirty-two sonatas, concertos, chamber music, and nine symphonies represent the *summum bonum* of human musical effort and, as Parry truthfully says, "bear the marks of a higher degree of concentration and a wider range of design" than those of his forerunners except Bach, "and the sum of the result is the richest and most perfect form of abstract instrumental music which exists in the whole range of music." Beethoven literally re-created the sonata form, adding to it new movement, filling it with an incomparable emotional and intellectual content. The symphony he enlarged and vivified, buried the old tones of formalism, and gave it the scherzo, gave it power, majesty, tenderness, and supreme beauty. The orchestra became a new instrument in his treatment of it, and for the first time each member of the instrumental army was given liberty. Color, grace, delicacy, and elasticity are revealed in the Beethoven orchestration. (See INSTRUMENTATION.) Unity in variety, the highest law in all artistic creation, is the distinguished characteristic of this wonderful man's work. There is little need to dwell upon Hummel (1778-1837), a pupil of Mozart and a refined pianist; or upon Ries and other imitators of the Beethoven style. Karl Maria von Weber (1786-1826) proved himself to be a versatile composer and one who greatly influenced Wagner. *Der Freischütz* is still played. In his overtures to *Der Freischütz*, *Oberon*, *Euryanthe*, Weber revealed a fine color sense and a genuine fantasy. His piano music is brilliant, effective, and some of it chivalric, though in formal sense he broke away from the classic and reveled in the romantic. Franz Schubert (1797-1828), unique as a *lied* composer (see LIEB), wrote many symphonies, two of which, at least, are famous, many piano sonatas, minor pieces, and chamber music. His charm lies in his rich melodies, the most fragrant and original since Mozart's, and a personality of rare attractiveness. His very profusion enchants. With Louis Spohr (1784-1859) we have little in common nowadays, despite his valuable contributions to violin literature. His music in the larger choral and instrumental forms sounds antiquated. Felix Mendelssohn-Bartholdy (1809-47) was one of the best equipped musicians of the century, a writer of refined melodies, a master of orchestration and a man of delicate imagination. He wrote his *Midsummer Night's Dream* when a mere youth, and he never surpassed it, though there is more depth in the Hebrides overture (1830). From an idol of the mid-Victorian reign, Mendelssohn has become a man to-day comparatively neglected and certainly underestimated. He wrote absolute music in a pure style and did not attempt to transcend its sphere, or rather his own limitations. He was an accomplished organist and pianist, and wrote with skill and ingenuity for both instruments. The Mendelssohn piano music—

not the familiar *Songs Without Words*—is a mine of good things—the *Variations sérieuses*, for example. (See VARIATION.) His oratorios *Elijah*, *Saint Paul*, and the *Reformation Symphony*, with its chorale, are built upon a close study of Bach and Handel. To Mendelssohn the musical world owes a debt of gratitude for his labors in unearthing many Bach manuscripts. Of the many symphonies Mendelssohn wrote, the most frequently heard are the *Scotch* and the *Italian*. His violin concerto is a model of its kind.

Hector Berlioz (1803-69), a Frenchman of colossal ambition, elected to tread in the footsteps of Beethoven, composing music in the grand manner and devoting himself to the development of orchestral resources, with the result that he died the greatest composer of France and may be truly entitled the father of the programme school in music. What he did for it was chiefly in a loosening of formal knots, in rhythmic devices and orchestral color. The affixing of romantic titles, such as *King Lear*, *Waverley*, *Les francs juges*, *Lélio*, *Harold*, and the rest, is not an original device, while Franz Liszt, affected as he was by Berlioz's original discoveries in instrumentation, is really the intellectual protagonist of the movement, for he invented the *Poème symphonique*, a species of foreshortened symphony. (See SYMPHONY.) Berlioz had not so much new to say, but he was an incomparable stylist. His music is agitated, dramatic, fantastic, and also fascinating. In his *Te Deum* he has almost compassed the sublime, and he forged a passport to posterity in his *Damnation of Faust*. Like Liszt, Schumann, and Wagner, Berlioz was a man of pronounced literary ability. Frédéric Chopin (1809-49) stands alone in an age crowded with musical greatness. The most poetic of all composers, using poesy as subject matter rather than the ordinary phraseology of music, he contrived to write for the pianoforte, an instrument abused by rapid virtuosi, a mass of music as individual as Bach's or Beethoven's. He had no predilection for the sonata form, though he left three solo sonatas and one for piano and violoncello; but he idealized various dance forms such as the polonaise, valse, mazurka, krakowiak, composed most original ballads, scherzos, nocturnes, fantasias, impromptus, and as a companion book to the *Well-Tempered Clavichord* wrote twenty-seven studies and twenty-five preludes which are invaluable contributions to piano literature. More than this, Chopin was a melodist of rare quality and an inventor of harmonies the most daring of the century. Even Wagner shows a close study of Chopin in his harmonic system. An apparition in art, this Pole sang the sorrows of his native land in exquisite accents, played the pianoforte as no one before or after him, and literally formed a new technical school. His early music shows traces of Hummel and John Field, but his native originality soon lifted him out of the track of routine. His influence affected Liszt and the younger school, the Neo-Russians, and Wagner. Robert Schumann (1810-56) is another original composer quite as subjective as Chopin, but without the latter's formal sense, a sense cultivated by devotion to Bach's music. Schumann's imagination is tropical and his indirect influence in modern music has been a powerful one. Not a great symphonist, he nevertheless composed four charming symphonies, and chamber music of

CHRONOLOGICAL CHART OF COMPOSERS

15th Century	16th Century	17th Century	18th Century	19th Century			
Italian.....	Festa (1480-1546)	Animuccia (c. 1500-71)	Merulo (1533-1604)	Corelli (1633-1713)	Logroscino (c. 1700-63)	Palaisio (1741-1816)	Verdi (1813-1900)

a high character, notably the pianoforte quintet. (See QUARTET; QUINTET.) The concerto for pianoforte in A minor is justly beloved by artists and public alike. It contains passages of rare romantic beauty. But it is in his songs and smaller pieces for the pianoforte that the peculiarly introspective nature of this German musician is seen at its best. The *Carnaval*, *C major Fantasia*, *F sharp Minor Sonata*, the *Symphonic Studies*, the *Fantasiesücke*, *Kreisleriana*, *Toccata*—most spiritual of technical studies—*Papillons*, and the rest are Schumann's monuments. As a song-writer he ranks below Schubert and with Robert Franz and Brahms. Franz Liszt (1811-86), after bewitching the world with his wondrous pianoforte playing, composed an incredible quantity of music, and the twentieth century will doubtless give him the laurels of the composer he craved. His pianoforte music is in the highest degree stimulating; his orchestral compositions, *Symphonic Poems*, and symphonies *Faust*, *Dante*, and the superb *Graner Mass* proved too tempting for his son-in-law, Richard Wagner, who assimilated their melodic content and harmonic audacities in his music-dramas. Liszt's is still music of the future. The exact antipodes of this gifted Hungarian was Johannes Brahms (1833-97), who, finding the classic forms sufficiently strong for his new wine, poured it out with gravity and unhurrying serenity. His four symphonies (colored by Hungarian feeling), his piano and chamber music, are the revelations of a noble nature. Brahms is not dramatic in the theatric sense, but he has epic breadth of utterance, and his music is always noble. A romantic in feeling, his Teutonic reserve checked extravagance; and yet his later piano music, with its formal freedom and novel content, proclaims Brahms to be far from the ascetic classicist his critics style him. He is the great symphonist since Beethoven, and in his chamber music is second only to the Bonn master. His songs prove him to be a born romanticist and a poet of recondite moods. Raff, Rubinstein, Henselt, Heller, Bruch, Hiller, Rheinberger, Gade, Reinecke, Scharwenka, Moszkowski, Saint-Saëns, Grieg, Svendsen, Goldmark, Bruckner, Dvořák, César Franck, Bizet, d'Albert, Gounod, Chabrier, Humperdinck, Massenet, Godard, Bunnert, Debussy, C. M. Loeffler, d'Indy; the Russians, Glinka, Dargomyzhky, Rubinstein, Borodin, Balakireff, Mussorgsky, Cui, Rimsky-Korsakoff, Glazunoff, Rachmaninoff, Scriabine, Tchaikowsky; the memorable army of virtuosos and singers, Paganini, Bottesini, Wieniawski, Popper, Joachim, Davidoff, Wilhelmj, Kalkbrenner, Thalberg, Bülow, Clara Schumann, Karl Tausig, Joseffy, Rosenthal, Essipoff, Paderewski, Pachmann, Sophie Menter; the singers, Sontag, Malibran, Albani, Rubini, Lablache, Mario, Jenny Lind, Tamburini, the two Pattis, the de Reszkes, and others whose name is legion—all these are derivative composers or interpreters. Grieg and Dvořák deserve especial mention for their national characteristics—Norwegian and Bohemian. Grieg is a harmonist of rare skill, and Dvořák a master of orchestration. His sympathetic music displays influences of Schubert and Smetana (1824-84), the latter Bohemia's representative musician. Tchaikowsky (1840-93), Russia's one supreme composer, is treated at length elsewhere, as is Richard Strauss.

MUSIC IN THE UNITED STATES is largely the

history of the past quarter of a century. Before that, Italian opera ruled the eastern shore of the land, and previous to the advent of Italian opera in 1825—a company that included Garcia and his daughter, Malibran—the psalmody was the sole musical pabulum of our nation. Struggling for independence, transfixed by many wants and dangers, it is not surprising that hymn-tunes of the most primitive order should prevail. Our ancestors were too busy fighting, or toiling for daily food, to find solace in the arts. And the Puritan draped the country in the deepest morality, so that music with difficulty conquered a place. Thomas Hastings, Lowell Mason, and Dudley Buck have done much to elevate church music, though our real musical culture began not with the numerous visits of Italian opera, but with the formation of local orchestras; the Philharmonic Society of New York, the Boston Symphony Orchestra, the Chicago Symphony Orchestra, the Pittsburg and Philadelphia orchestras, and also the many choral societies throughout the country. Theodore Thomas was our pioneer in matters symphonic, and, both with the Philharmonic and Chicago Symphony Orchestra, his work will never be forgotten. Carl Zerrahn, Carl Bergmann, Henschel, Louis Maas, Leopold Damrosch, Asger Hamerik, Anton Seidl—who first taught us the beauties of the Wagner music-drama—Frank Van der Stucken, Arthur Nikisch, Wilhelm Gericke, and Emil Paur have all contributed their quota to the general fund of culture. Resident conductors are George Chadwick, Victor Herbert, the Damrosch brothers, Walter and Frank, Fritz Scheel, Arthur Mees, F. X. Arens, B. J. Lang, E. Heimendahl, Jules Jordan, and many others, while in the domain of popular music the names of Gilmore and Sousa have become classic. The so-called vein of negro music, so dear to folk-lorists, was mostly written by white men. John Howard Payne wrote "Home, Sweet Home," to which Stephen C. Foster's "Old Folks" is a close second in popularity. But the present generation of composers contains men in its ranks of real worth, though their culture has been attained under European masters: John K. Paine, William Mason, Pratt, Gleason, George W. Chadwick, W. W. Gilchrist, Arthur Foote, Converse, Edward A. MacDowell, Horatio W. Parker, Frank Van der Stucken, Henry Holden Huss, Harry Rowe Shelley, Edgar Stillman Kelley, Walter Damrosch, Arthur Whiting, Reginald de Koven, Rubin Goldmark, and last but not least that most brilliant pianist and composer of Creole music, Louis Moreau Gottschalk (1829-69), who was long considered a representative American by Europeans. Music is now a necessity in America, and the culture of choral singing makes several of the larger universities like Harvard, Yale, Columbia, Pennsylvania, Ann Arbor, and Oberlin, have chairs of music. Foreign artists find in the United States a veritable gold mine, for singers draw higher salaries here than in any other part of the globe. So we have enjoyed the great music-makers of the world, from Malibran to Ternina. Many of the famous virtuosos, Thalberg, Von Bülow, Essipoff, Rubinstein, Joseffy, Rosenthal, Paderewski, de Pachmann, d'Albert, Fannie Bloomfield Zeisler among pianists; and Vieuxtemps, Sivioli, Ole Bull, Camilla Urso, Wieniawski, Sarasate, Wilhelmj, Reményi, César Thomson, and Ysaye, violinists, are a few of the prominent artists who have earned applause and

money on these shores. Dr. Antonin Dvořák made New York his home for three years as the director of the National Conservatory, and composed here his *New World Symphony*. American singers, especially women, are better known abroad than our native composers; Albani, Clara Louise Kellogg, Annie Louise Cary, Minnie Hauk, Emma Thursby, Antoinette Sterling, Lillian Nordica, Emma Nevada, Emma Eames, Sibyl Sanderson, Lillian Blauvelt, Zélie de Lussan, and others have honored their country with artistic triumphs. Adelina Patti spent the early years of her life in New York, and, as well as Christine Nilsson, Parepa, Gerster, Melba, Sembrich, and Lilli Lehmann, has been adored by enthusiastic operagoers. Thus far America has not produced a genuinely representative composer.

MUSIC, PSYCHOLOGY OF. The psychology of music deals with the mental processes which furnish both the motives for its production and the ground of its appreciation. It has an individual and a social aspect; for music as an art involves not only the individual consciousness, as such, but also, since it is a means of expression and communication, the modification of one mind by another.

The mental elements primarily involved in music are sensations of tone. Of the 10,000 or 11,000 tones which may be distinguished in con-

sciousness, music uses a comparatively small number. Our own elaborate musical system includes only 85 or 90, ranging from about 40 to 4000 vibrations per second; something less than seven octaves. The simple tonal sensation is produced by an uncompounded pendular vibration of the air. The note or simple clang is composed of a number of simple sensations, called partials or partial tones, one of which (the lowest) is the fundamental; the others are called overtones. The character ('timbre,' 'clang-tint,' 'quality') of the note is determined by the number and intensity of the various partials. (See 'CLANG-TINT, EXPLANATION OF.') Every simple tone has three aspects or attributes: quality, intensity, and duration (q.v.). Quality is pitch (high or low); intensity is degree (a tone is 'loud' or 'soft,' strong or weak); duration is temporal length (long or short). To these some psychologists add a fourth attribute, extension or voluminousness; a tone is said to be 'big' or 'thin,' 'broad' or 'pointed.' It is a question whether the spatial attribute is not reducible to simple qualitative differences plus associations from vision and pressure. By the combination and variation of the first three attributes, all classes and forms of music are produced. There is, first of all, the combination of qualities and intensities in the note, which is the practical basis of music. Above this stand the alternations of intensities which produce rhythm, the successive rise and fall of pitch forming the essence of melody, and the synchronous combinations of pitches (see **FUSION**) known as harmony. Music began, doubtless, with the simplest of these combinations. We find in primitive music a small number of qualities used over and over, without the finer shadings of intensive differences, with little or no appreciation of harmony, but often with a strongly marked rhythm, accentuated by various bodily movements. (See **ART, PRIMITIVE**.) But the growth of music has been marked not so much by complications in quality, intensity, and duration—great as these have been—as by another factor in development which has proceeded *pari passu* with the mental evolution of the race. This factor is the capacity to group and unify series of units, the capacity to form perceptions and associations between isolated tones. A perception (q.v.) is always something more than the summation of a series of sensational elements. It is the reading of meaning, of significance into the series taken as a group or whole. Musical perception has developed in precisely the same manner as have other forms of perception, by the widening and deepening of meaning. Compare, e.g. a savage's perception of a protruding stratum of rock with a geologist's. One is poor, simple, shallow—as bare as the rock itself; the other is rich, complex, deep—as complicated as the conditions under which the rock was formed: it contains group after group, and leads to complex trains of associations. The case is similar with music. Primitive man used a simple musical alphabet and spelled out simple, childish phrases. Take as an instance the following example which the aborigines of Australia were accustomed to reiterate over and over for hours:

Put this beside Wagner's "Ring of the Nibelungs." The two may be said to represent almost the extremes of musical culture, the capacity to combine tonal elements into significant unitary wholes. The monotonous chant of the Australian, no less than the creations of Wagner and Beethoven, contains a design, an organization, a putting into definite form of a number of detached elements. It is this which distinguishes music from a haphazard arrangement of tones or the isolated calls and cries of animals, however important these may have been in the genesis of music.

But if music implies form, it also implies content. It is a vehicle of expression no less than a way of arranging and organizing tones. When now we come to inquire into the processes which lie behind musical production, we find that they are various and highly complex. We shall, however, get an insight into their nature if we look upon music both as a means of conscious expression and as a medium of communication. Regarded in this light, music takes its place beside gesture speech and writing. It differs from speech, however, in that it gives voice to feelings and emotions instead of to ideas. Speech is primarily a medium for the communication of 'thought,' and when it attempts to express emotion and sentiment borrows straightway from music—either rhythm (in taking poetic form) or melody (in constructing recitative or song)—or it may go back to the common root of speech and music, and enrich itself from the language of gesture and mimetic movement. But while music's ultimate appeal is to the sensibilities, it cannot be said to exist apart from the intellect or the will. Such absolute disjunction could only rest on the fallacy that intellect, feeling, and volition are separable faculties of the mind. (See FACULTY.) Music arouses not only feeling, but also thought and action. The complex nature of the 'musical consciousness' is indicated by the fact that it is now called a feeling, now an emotion, now a perception, and now a sentiment. (See these words.) It is, indeed, all of these. The pleasurable feeling which music induces is undeniable: it arouses an emotion in the sense that it presents 'situations' which call forth organic sensations squarely faced by the attention; it includes the organization of auditory sensations into unitary perceptual wholes; and, finally, it involves sentiment by taking the form of the æsthetic judgment, e.g. 'these elements combined in this way are beautiful.' Nor does this exhaust the contents of musical expression. There may be, both in the motive of the artist and in the consciousness aroused in the hearer, imaginations, retrospections, moods, desires, associations, resolves, and volitions. Thus far does the 'musical consciousness' range. The key to its complexity is furnished by a review of the large number of modes through which music appeals to consciousness. In the first place, simple tones have an affective value, which is different at different parts of the scale. Secondly, the simple clang or note varies not only, as we have seen, in sensational elements, but also in pleasantness and unpleasantness, as its clang-tint changes. Thirdly, the same element of fusion which amalgamates the partials in the note is also present in the chord. Fourthly, the chord is also more or less pleasant, more or less consonant or dissonant. Other elementary factors are

the indefinite number of possible accentuations, of pitch sequences, repetitions, and alternations, of similarities and contrasts. Add to these the possibilities of modulation from key to key, the host of figures in each of which there is the charm of the like and the diverse, of symmetry and of complexity, and of unity maintaining itself in variety; add the employment of various instruments, including the human voice, and centuries of experience lending their wealth of associations, and the intricacies of musical composition and appreciation receive at least a partial explanation. The explanation cannot be completed except by a comprehensive account of the genesis and development of music. (See *ÆSTHETICS*; *MUSIC*.) There are two or three stages in the evolution of music which deserve mention here on account of their psychological importance. The first is the production of the scale. It is very difficult for us to conceive what music would be without a definitely formulated scale. We have so constantly in mind the scale which has formed the basis of Western music for centuries that it is almost impossible to appreciate the mental processes of people who have had music without a definite scale, or even of those whose scheme of intervals differs from ours. And yet, it is certain that a formulated scale follows upon musical practice. The scale came from melodic utterances as rhythm came from the regular movements of the dance. We find in the music of savages informal and unsystematic vocal expressions of feeling which are sometimes no more than intoned wails or howls, sometimes haphazard collections of simple figures repeated with little order or unity. When these become definite enough to be remembered and to be repeated from time to time, material for the formation of scales begins to collect; but the scale as an abstract arrangement of musical intervals appears only at a comparatively late stage of intellectual progress. The nucleus of the scale was probably at first a single interval—an interval which was agreeable and expressive. A comparison of various scales, Eastern and Western, ancient and modern, points to the fifth and the fourth as the first intervals to be selected. Gradually other notes were added and two general types of scales were formed: the pentatonic (scales based on five notes), in use in China, Japan, Java, and the Pacific Islands, and the heptatonic (based on seven notes), the scales of India, Persia, Arabia, ancient Greece, and modern Europe. In all countries the octave seems to have been more or less explicitly recognized. The fact that most Caucasian races have produced seven-note systems, and the peoples of Eastern Asia five-note systems, indicates that the general structure of the scale depends ultimately upon artistic impulses which are common to a given type of mind. The attempt to derive the heptatonic scale from an earlier, more primitive pentatonic, seems to have failed. The two types appear to be equally primitive. Instruments giving a diatonic scale date as far back as the Stone Age. Doubtless, the choice of the interval of the semitone depends largely on the fact that the semitone is the smallest interval that the human voice can produce with ease and accuracy. Wallaschek, however, is of the opinion that the voice even with the aid of the ear would never have produced regular scales without help from musical instruments. Simplicity in construc-

tion and use of instruments determined, he believes, the formation of the two great types of scales. But there is no reason why vocal utterance itself should not have produced intervals of varying degrees of pleasantness and unpleasantness which would supply sufficient motive for the choice of a definite scale. The modes of Greek music furnish a good instance of scale construction upon a melodic basis; while our own major and minor scales illustrate the effect which harmony produces upon scale-making. The fact that the scale, as we have it now, was a thousand years in the making gives evidence at once of its evolutionary character and of its dependence upon antecedent and contemporary musical practice. From a melodic system was gradually developed the tonal sequence in which every note has its artistic functions in relation to every other note. This principle of tonality, relation of the various parts of the scale to the tonic, has had a gradual development no less than the selection of tones. Helmholtz remarks that primitive music, since it depends largely upon verbal expression to complete its meaning, has little need for tonality. This is true even in Greek and early Christian music. He argues that tonality is a purely æsthetic product, which has been increasing up to modern times. The latest modification of our scale has been the introduction of regular chromatic intervals (represented by the black keys upon the piano), for the purposes of modulation and the assimilation of keys. It would require, however, a great number of extra notes to produce the pure diatonic scale on each note taken successively as tonic. Various compromises have, therefore, been made by tempered intonation, in which the pure intervals are more or less modified. The present method of tuning in use among Western peoples is based upon the system of equal temperament, which divides the scale into twelve equal parts, or semitones. This system allows no perfectly pure interval except the octave, but is extremely simple and affords opportunity for varied musical expression.

From what has been said of the scale, it may easily be seen that its function is to furnish a stable basis for musical construction. It represents the results of æsthetic instincts and judgments which have been accumulating for centuries, and it is, at the same time, the embodiment of the principle consciously or unconsciously underlying every musical composition.

A second factor of psychological importance in the history of music is the growth of polyphony and harmony (q.v.). It has often been said that the earliest form of musical expression was melodic. It is certainly true that there are great racial as well as temporal differences in the apprehension of harmonic relations. Hottentots, e.g. have shown a keen native appreciation for European harmonies which have failed to move the Chinese and other Orientals. But, at the same time, it may be laid down as probable that the same tonal peculiarities which had led to the development of melody have led also to the production of harmony, whether these peculiarities rest, ultimately, in the fusion of simple tones (Stumpf) or depend upon clang-relationship (Helmholtz). It must, however, be admitted that there are periods in which either melody or harmony seems to have an almost independent development. The history of European music

furnishes a good illustration. Western music was essentially melodic in ancient Greece. The early Christians borrowed the melodic Greek modes in mutilated form. To these was added, very gradually, a new element. Ecclesiastical tunes were sung with the intervals of the fifth and the fourth, and attempts were made to sing different tunes together. Then came a long era of development of polyphonic music. Contrapuntal arrangement reached a high degree of perfection in the service of the Church. But the movement away from simple melody was destined to extend much further than the perfection of counterpoint. Choral singing had already laid the basis for the elaborate system of harmony which now began to be formulated. By the end of the sixteenth century the independent significance of chords and their artistic connection, apart from the progression of 'voices,' came to be recognized. This was the real opening of the modern era of harmonic music. There are two chief factors which contributed to its establishment: (1) the Church's demand for intelligible chorus and congregational singing, for which the complicated polyphonic forms were not suitable; and (2) the rise of the opera, which in its revival of ancient tragedy called for solo singing with harmonic accompaniment. The wealth of harmony has been greatly augmented by the development of instrumentation, which has reached its climax in the modern orchestra.

In making a survey of the achievements of Western music, it is important to keep in mind the fact that our system is largely a product of taste and by no means the only possible way of utilizing the tonal elements at man's disposal. Other races and other epochs have solved their musical problems in other ways. These, if not so agreeable to us as our own, have been satisfactory to their inventors. Neither can our canons of taste be regarded as more fixed than are others. They are, on the contrary, extremely variable. Even since mediæval times so radical a change has been effected in æsthetic preference as the substitution of first the fifth and the fourth, and later the major third, for the octave as the most agreeable interval. What further changes will take place it is unsafe to predict.

MUSIC, CONSERVATORY OF. A school for instruction in music. See CONSERVATORY.

MUSIC, SCHOOLS OF COMPOSITION. In order to make possible a general view of the numerous composers that have contributed to the erection of the structure of music, musical historians have agreed to classify various composers into schools. The composers thus classed together under a certain school show common influences

or tendencies, but dividing lines between the various schools are often imperfectly marked.

I. *The Old French School* (c.1100-1350).—The principal merits of this school are the invention of the *Fauxbourdon* (a progression of voices in sixths and thirds) and the *Discant* (contrary motion of voices). This contrary motion led to counterpoint, and this again to the establishment of a system of notation in which the different values of the notes in regard to time were definitely fixed. (See *MENSURABLE MUSIC*.) After a *discant* was once set in contrary motion to a *cantus firmus* composers soon conceived the idea of adding a third and even a fourth voice. But the masters of the Old French School did not stop here; they succeeded also in imparting complete independence to the individual voices. Three art-forms were developed: the *motet*, *rondellus* (rondeau), and *conductus* (conduit). In all these forms are found well-defined passages of writing which to-day we call 'canon' and 'imitation.' The prominent masters are: Leonin, Perotin, De Garlande, Franko of Paris, De Vitry, De Machault, De Muris.

II. *The Gallo-Belgic School* (c.1350-1500).—The masters of this school began to feel the emptiness of consecutive fourths and fifths, and so used sixths and thirds more freely. Greater attention was given to the leading of the voices, and technique made great strides. Occasionally the compositions rise above the level of mere technicality. The principal masters are: De Zeelandia, Faugues, Dufay, Binchois, Busnois, Regis.

III. *The School of the Netherlands* (c.1450-1600).—This school divides itself into four distinct periods: (A) Okeghem developed the art of canonic writing to such an extent that it became merely ingenious trickery. Instead of unified forms, the works of this school present a conglomeration of detached details. Okeghem's successors were: Hobrecht, Tinctor, Jannequin, Brumel, Compère. (B) The leader of the second period is Josquin Deprès, a pupil of Okeghem. He and his contemporaries strove to make their skill subservient to artistic purposes by emphasizing the symmetry of form and by paying attention to the development of their themes. The leading composers are, besides Deprès, Agricola and Mouton. (C) The extreme artificiality of the two preceding periods led to a reaction in favor of a more simple and natural style. The masters started from Josquin's principle of symmetry. They also developed the purity of harmonic writing, and insisted upon definite melodic phrases. Several of them carried this style to Italy, where they became the founders of new schools. These composers were: Gombert, Willaert, Goudimel, Arcadelt, Van Rore. (D) The fourth period shows the influences which the Italian schools had begun to exert over the mother school. Whereas the importance of the earlier schools rests entirely upon the vocal works, the fourth period marks the rise of instrumental music (organ) in the works of Sweelinck, who practically became the founder of the famous school of the North German organists. The whole school of the Netherlands reached its culmination in the works of Orlando di Lasso, a master scarcely inferior to the great Palestrina. The great musicians of this period are: Sweelinck, Lasso, Di Monte, Pevernage.

IV. *The Old English School* (c.1220-1600).—

(A) England possesses the oldest known specimen of polyphonic writing, the famous canon "Sumer is icumen in." As long as the school of the Netherlands was regarded as the oldest, this manuscript puzzled musical historians. Coussemaker in 1865 proved the existence of the still older French School (I.), and so this canon is now assigned to the year 1226. During the fifteenth century a school showing the same general characteristics as the Old French School must have existed in England, if we may judge from a few preserved compositions by John of Dunstable. (B) The reign of Henry VIII. witnessed a considerable musical activity, but no new style was created. The representative composers, Redford, Johnson, Merbecke, and Tye, show the influence of the School of the Netherlands. (C) These men really prepared the way for the next generation, when the style of the School of Venice predominated. Of this period numerous large choral works and madrigals have been preserved. The chief composers are: Farrant, Tallis, Byrd, Gibbons.

V. *The School of Venice* (1527-1612).—Willaert brought the musical art of the Netherlands to Venice, where he settled in 1527. Under the influence of the more impressionable Italian musicians, he gradually acquired a new style. In the style of the Netherlands each voice was practically independent, and its relation to a definite chord was not strongly pronounced. The Venetian masters established the chord as their basis, and, instead of simultaneous progressions of voices, we find, rather, progressions of chords. The independence of the separate voices was restricted, but not abolished. The custom of writing for a double chorus was introduced, the madrigal was perfected, and for the first time vocal works with instrumental accompaniment appear. The great composers of this school are: Willaert, A. Gabrieli, Van Rore, Zarlino, Merulo, Donati, G. Gabrieli.

VI. *The School of Rome* (1535-1674).—The founder of this school was Goudimel, who settled in Rome about 1535. While the Venetian School regarded the chord as a basis, and gained their effects largely by means of modulation, the Roman masters restored greater freedom to the individual voices, and subordinated technique to art. The introduction of secular themes into sacred works had led to serious abuses, but the Roman masters, especially Palestrina, proved that the contrapuntal style is not antagonistic to the dignity proper to church music. To the Roman School also belongs the honor of having originated the oratorio (Carissimi) and a distinct instrumental style (Frescobaldi). Merulo in Venice had done much to develop the toccata, but not until Frescobaldi appeared did instrumental music become entirely free from the influence of vocal music. The greatest masters are: Goudimel, Festa, Animuccia, Palestrina, Nanini, Anerio, Allegri, Frescobaldi, Carissimi.

VII. *The Spanish School* (1540-1608).—Spain at no time succeeded in establishing an original school. During the sixteenth century several Spanish composers lived in Rome, and returning to their native land, carried with them the art of the Roman School, so that in reality the Spanish School forms only a part of the Roman School. The most prominent Spanish masters are Da Vittoria and Morales. The Portuguese composer a Goes shows the influence of Gom-

bert, which can be accounted for by the fact that this Flemish musician spent some years in Spain.

VIII. *The German Polyphonic School* (1500-1625).—This school divides itself into two periods, the former showing Flemish, the latter Venetian, influences, but in the frequent and bold use of dissonances the German masters go beyond their predecessors. The chief composers showing Flemish influences are: Isaak, H. Finck, Senff, Hermann Finck. Those showing Italian influences (almost all pupils of G. Gabrieli) are: Gallus, Gumpeltzhaimer, Hasler, Aichinger, Prätorius.

IX. *The School of Protestant Church Music* (1540-1672).—(A) In Germany, the Reformation popularized church music by the introduction of congregational singing. For untrained voices simple music was needed, and this need gave rise to the *chorale*, which originated in the singing of sacred words to popular folk-songs. The musicians whose importance rests chiefly upon their chorales are: Luther, Walther, Eccard, Calvisius, Franck, Schein. (B) From the earliest times it had been customary in the Catholic Church to recite during Holy Week the Passion of Our Lord according to the Gospels. Luther desired to preserve this custom for the Reformed Church. He translated the text and had various composers furnish the music. Thus arose the "Passion," to the cultivation of which many German masters devoted their best energies. Along this line vocal polyphonic music steadily developed until, in the works of Schütz, German music reached an originality that places it on a level with the famous Italian schools. The German School combines the beauty of the Roman School with the massiveness of the Venetian. In addition, there is a tenderness and a subjective, passionate element quite distinct from the colorless solemnity of the early Italian music. The important masters are: Schütz, J. C. Bach, J. M. Bach.

X. *The School of German Organists* (1620-1722).—(A) While vocal music was steadily advancing, instrumental music, although of later date, was not neglected. Sweelinck had founded a great school in the Netherlands, which trained many Germans, who carried the art into their native land. There the cities of Hamburg and Lübeck became the centres of a new instrumental school whose basis was the *chorale*. The principal forms cultivated were the *toccata*, *ciaccona*, *fugue*, and, toward the end of the period, the *sonata*. The great North German masters were: Scheidt, Scheidemann, Reinken, Buxtehude, Kuhnau. (B) While the North German masters developed the style of Sweelinck, a group of composers in the middle and south of Germany worked along similar lines, but under the influences of Frescobaldi and the Roman School. The authority of the Italian *sonata* writers had by this time extended to Germany, and the forms of the *sonata da chiesa* and the *sonata da camera* were cultivated. Nor was the *fugue* neglected. All the great composers used the Italian forms, but infused their own individuality into them, and thus prepared the way for J. S. Bach, who wrested the leadership in musical affairs from Italy and transferred it to Germany. The German masters who aided in this great work are: Kerl, Froberger, Pachelbel, Muffat, Biber.

XI. *The School of Florence* (1594-1676).—

While the earlier Italian composers cultivated almost exclusively the polyphonic style of vocal music, a school with widely different tendencies sprang up in Florence. The revival of the learning of Greece led to an attempt to reconstruct the ancient drama. Thus arose the monodic style, in which one voice sings while instruments furnish the accompaniment. In 1594 Peri set an entire drama, *Dafne*, to music in this manner. Crude as the attempt was, it found favor, and in less than half a century the new style had conquered all Europe. Its development was not confined to Florence; in fact, its greatest exponent, Monteverde, was a native of Cremona, although he lived chiefly in Mantua and Venice. But as the style originated in Florence, it seems advisable to classify all composers identified with its development under the Florentine School. This school first dispensed with the preparation of dissonances, and greatly developed the orchestra, establishing the strings as its foundation. The works of this school were first designated by the title *Dramma per musica*. About 1650 we find *Opera per musica*, which soon afterwards became simply *Opera*. The principal names of this division are: Peri, Caccini, Monteverde, Cavalli. See OPERA.

XII. *The School of Naples* (1675-1757).—As early as 1475 a Flemish master, Tinctor, settled in Naples, but not until two hundred years later did a distinct school arise. From Rome and Venice the Neapolitans adopted the polyphonic church style, from Rome the oratorio, and from Florence the musical drama. The new school paid more attention to the melodic outline of the highest voice, perfected the form of the *aria* (q.v.), and introduced it into their dramatic works. Whereas the Florentine musical drama consisted of continuous recitative by a single voice, the Neapolitans introduced not only the *aria*, but also choruses, duets, trios, etc. The Florentines had emphasized the *dramatic*, the Neapolitans emphasized the *musical* element. They also cultivated the form of the concert overture. (See OVERTURE.) Transferring the form of the *sonata da chiesa* to compositions for the clavi-chord, and introducing a secondary against a principal subject, they prepared the way for the modern *sonata*. The principal masters are: Stradella, A. Scarlatti, Durante, Loggrosino, Leo, D. Scarlatti.

XIII. *The Early School of French Opera* (1645-1764).—After the Old French School had been supplanted by that of the Netherlands, we have no more records of music in France until 1645, when a work of the Florentine monodic style was produced in Paris. The rise of the French drama through the works of Corneille, Racine, and Molière turned the general attention to the stage. Lully became the founder of a distinct school of French opera. The characteristics of this school are better dramatic characterization and the raising of the chorus to an active participation in the dramatic development. The orchestra also is increased by the addition of kettledrums and trumpets, and the character of the wood-wind is recognized. The important names are: Cambert, Lully, Marais, Rameau.

XIV. *The Later School of Venice* (1650-1739).—The German Protestant masters had introduced a subjective and emotional element into their church music. This became the keynote

of the later Venetian masters. A distinctive feature is the development of some particular theme which begins in a lower register and gradually rises higher and higher, leading to an effective climax. The growth of the orchestra also gave the composers an opportunity to heighten the effect of their vocal polyphonic works. The chief masters of this school are: Legrenzi, Lotti, Caldara, Marcelllo.

XV. *The English School of the Restoration* (1660-94).—After the death of Gibbons in 1625 music declined rapidly in England. This decline is due to the unsettled state of affairs during the reign of Charles I. and the fanaticism of the Puritans, who objected to the cultivation of music, and destroyed many valuable manuscripts. When, at his accession in 1660, Charles II. attempted a restoration of music, practically a new start had to be made. In spite of many drawbacks, however, music soon attained its former importance. Purcell, the greatest musical genius England has ever produced, now appeared, and under his inspiration English music rose to such a height that for a short time England boasted a national school of opera. The principal composers of the Restoration are: Humfrey, Wise, Blow, Purcell.

XVI. *The School of Italian Sonatists* (1620-1800).—Up to the seventeenth century the organ was the great means of developing instrumental music (toccata, ricercare, fugue). By the beginning of that century the violin had been considerably perfected and attracted a number of musicians in Northern Italy. These composers prepared the way for our highest musical art-form, the sonata. About 1650 a distinction began to be made between *sonata da chiesa* and *sonata da camera*; the former consisted of several movements of contrapuntal writing, the latter employed various dance-forms. Great attention was paid to thematic development. The instrumental concerto was introduced and the *concerto grosso* was cultivated. The principle of musical dualism, first announced by Scarlatti, was strongly emphasized. While in the eighteenth century all the art-forms in Italy declined, this school of sonata writers was the only one that made progress in the art. The principal masters are: Legrenzi, Bassani, Torelli, Veracini, Corelli, Tartini, Boccherini.

XVII. *The School of the German Singspiel* (c.1630-1800).—(A) In the beginning of the seventeenth century there arose in Germany the so-called 'school comedy'—dramatic representations by students. Each act was preceded by a short musical dialogue introducing mythological personages. This custom led to the establishment of the German *singspiel* (q.v.), in which the acting personages were shepherds, shepherdesses, nymphs, etc. These *singspiele* finally gave rise to a national German opera in Hamburg, but not until Hiller in Leipzig established the *singspiel* upon the basis of the folk-song did this form rise to an artistic level. The composers of this school are: Strungk, Kusser, Keiser, Mattheson, Handel, Telemann, Hiller, Dittersdorf, Schenck, Weigl, Winter. (B) While the *singspiel* was popular with the masses, the German princes, decriing everything that was German, favored the Italian opera. Especially Vienna and Dresden became strongholds of the foreign style. Many German composers began to write Italian operas, and thus aided the rapid

decline of dramatic composition. Among these composers we find: Hasse, Graun, Doles, Naumann. See OPERA.

XVIII. *The Italian School of Decadence* (c.1750-1810).—With the aria the Neapolitan School had given to music that form which was soon to bring about a general decline of dramatic music. Dramatic truth counted for nothing; sensuous charm of melody and display of vocal art were paramount. Composers became the slaves of singers. The ballet became an important factor in the opera. Naturally composers did not waste time in studying counterpoint and polyphonic writing when success was so easily won by writing pretty melodies over the plainest harmonic accompaniment. The principal names of this school are: Porpora, Pergolesi, Jomelli, Piccinni, Sacchini, Paisiello, Salieri, Cimarosa, Zingarelli, Righini, Paër. See OPERA.

XIX. *The Classic Masters* (c.1700-1827).—As the contributions to music by our great classic masters are fully treated under the separate titles, mention is made of them here merely for the sake of completeness. BACH marks the culmination of the polyphonic period of music (see POLYPHONY), as well as the beginning of the new homophonic-harmonic period. (See HOMOPHONY.) In him the *passion* (q.v.) and the *instrumental fugue* reach their highest development. He brings equal temperament (q.v.) into universal use. HANDEL brings the *oratorio* (q.v.) and the *vocal fugue* to perfection. Taking up English music where the premature death of Purcell had left it, he becomes the founder of a new English school. GLUCK reforms the opera by emphasizing the dramatic in opposition to the purely musical element, without, however, disturbing the forms of the aria, chorus, duet, ensemble, etc. He greatly advances the art of orchestration. HAYDN perfects the *sonata* (q.v.) and establishes the modern form of the symphony and string quartet (q.v.), as well as the symphony orchestra, by individualizing the separate instruments. He is the 'father of modern instrumental music.' MOZART invents no new forms, but fills those existing with the contents of his wonderful genius. He is a universalist, equally great in all the forms he handles. In the works of BEETHOVEN absolute music reaches a point which would indicate the highest possible development, beyond which no progress can be imagined. He greatly enlarges the forms of Haydn and Mozart, and replaces the *minuet* (q.v.) of the symphony by the *scherzo* (q.v.). He strikes passionate accents never heard before in music, and discloses marvelous depths of emotion. SCHUBERT creates the art-song (*kunstlied*). (See LIED.) In the field of instrumental music he follows the path opened by Beethoven, but preserves his own strong individuality.

XX. *The English School Since Handel* (1750-1829).—When Handel settled in England in 1718 the national opera of Purcell had been entirely superseded by the Italian. Handel's own Italian operas exerted no uplifting influence, and have shared the fate of the works by his contemporaries. But when Handel began to cultivate the oratorio he laid the foundation of his fame as well as that of the English School. Unfortunately, he remained the only master. His contemporaries and immediate successors were unable to carry on his work, although they made earnest efforts. They, therefore, turned

their attention to the opera—not the foreign Italian product, but the national English opera. They even succeeded in establishing a style of their own different from the German *singspiel* or the French *opéra comique*. The spoken dialogue occupied altogether too much space, and, although the musical numbers were not lacking in a certain freshness and melodious charm, they were utterly devoid of all dramatic expression. Hence this national opera died with its authors. The most prominent composers are: Arne, Arnold, Dibdin, Storace, Hook, Shield.

XXI. *The French Grand Opéra* (1774-1864).—A peculiarity of the French opera is the fact that several of the masters who have contributed most materially to its advancement were foreign born. After the death of Rameau, French national opera was at a standstill, during which time the Italian opera gained ground. Then a German, Gluck, appeared with his reforms. The success of his *Iphigénie en Aulide* in 1774 marks the beginning of a new era of French opera. The new style was taken up by two Italians, Cherubini and Spontini, who finally established the *grand opéra*. Then native French composers began to take part. The characteristics of this school are: the prevalence of tragic subjects; the absence of spoken dialogue; the great attention paid to declamation, which very often degenerates into empty rhetoric and hollow bathos; a heavy orchestration, whose aim is for striking effects; and elaborate ensembles and finales. The introduction of a ballet after the second act is indispensable. In the choice of subjects those taken from history are specially favored. This school may be divided into two periods, roughly separated by the year 1830. The characteristics just mentioned apply more strictly to the second period (Meyerbeer); while the works of the first period, as a rule, are marked by a greater earnestness of purpose as far as the purely musical setting is concerned. The principal composers are: Gluck, Berton, Gossec, Cherubini, Lesueur, Spontini, Auber, Rossini (*Tell*), Meyerbeer, Halévy. See OPERA.

XXII. *The French Opéra Comique* (c.1760-1870).—This school presents three sharply marked periods. The productions of the first period somewhat resemble the German *singspiel*. The subjects are taken from everyday life or fairy tales. The secco-recitative of the Italian *opera buffa* gives place to the spoken dialogue; for the aria is substituted the French *chanson*. The works of the second period (c.1800-30) show the influence of German romanticism. The purely comic subjects are replaced by a mixture of comedy and romanticism. The music assumes a more serious character and better musical characterization is attained; the orchestra becomes an important factor, and the ensemble is strongly influenced by that of the *grand opéra*. In fact, some of the masters of the *grand opéra* belong equally to the *opéra comique* (Cherubini, Auber, Halévy). In the works of the third period we find very often that the only comical thing about them is their designation as *opéra comique*. Composers do not hesitate to choose tragic subjects. And yet such works are called *opéra comique*, because they differ from *grand opéra* by the fact that there is spoken dialogue. Nothing can very well be more tragic than Bizet's *Carmen*. But it contains spoken dialogue; hence it is *opéra comique*. In

opéra comique there is generally a healthier musical atmosphere, less striving for mere effect, more truthful dramatic expression, less artificiality. The great masters of this school are: Philidor, Monsigny, Grétry, Cherubini, Méhul, Isouard, Auber, Boieldieu, Hérold, Halévy, A. Thomas, Bizet, Delibes.

XXIII. *The School of Bel Canto* (1813-68).—We have seen that the opera in Italy declined rapidly after the middle of the eighteenth century. With the appearance of Rossini a new school may be said to begin. Even before him singing was the chief attraction; but his predecessors relied upon the technical skill of the singers to please the audience. Rossini surpassed all Italian operatic composers before him in the power of melodic invention. It is this sensuous charm of melody that distinguishes the school of the *Bel Canto* from the school of Decadence. Besides Rossini, the principal exponents of this style are Donizetti and Bellini. Of only secondary importance are Generali, Mercadante, and Pacini.

XXIV. *The German Romantic School* (1818-80).—The German romantic opera was developed from the *singspiel*. About the middle of the eighteenth century witches, gnomes, ghosts, and all kinds of spirits were introduced into the *singspiel*, which thus gradually gave rise to a new kind, the *Zauberoper* (magic opera). Although the texts of these productions were silly, and the attention was distracted from the purely musical element to the scenic decorations, yet this *Zauberoper* led opera into the realm of the mysterious, phantastic, and wonderful, where it has scored its greatest triumphs. The real beginning of the Romantic School is marked by the appearance of Weber's *Freischütz* (1818). With the appearance of romanticism music becomes more and more the individual, subjective expression of each composer, so that it is exceedingly difficult to arrange composers into schools. One characteristic of the Romantic School in general is the great advance in orchestral tone-coloring over the classic masters, and a decided preference for dissonances. Not only the different instruments become so many separate voices, but a distinction is made even between the various registers of the same instrument. Harmony becomes greatly enriched and is the principal means of emotional expression, while rhythm assumes greater diversity and complexity. Music in general becomes more intense and passionate. The instrumental composers at first fill the classical forms with romantic contents, and then originate new forms. In the field of dramatic music the principal composers are: Weber, Spohr, Marschner, Lortzing, Holstein, Kretschmer, Goldmark, Götz, Nessler, Brüll. Those who devoted their energies to instrumental and choral works are: Spohr, Schumann, Mendelssohn. The latter master has much in common with the classicists, and became the head of a school whose principal representatives are: Hiller, Reinecke, Jadassohn. The influence of Schumann is perceptible in another group of masters, of whom the most prominent are: Franz, Volkmann, Jensen, Huber. Midway between these two schools, and preserving characteristics of their own, are Raff and Rheinberger.

XXV. *Wagner — Liszt — Brahms* (1843-97).—Among the great German masters of the nineteenth century three stand forth so prominently

that it is impossible to classify them. Wagner and Liszt became founders of two distinct schools, whereas Brahms stands alone, without followers. Wagner began as the successor of the romantic opera of Weber. His reformatory work is concerned not with the opera in particular, but with dramatic composition in general. He emphasizes the drama and asserts that music must only follow and intensify the text. He practically banishes the chorus, ensembles, etc., and substitutes the monologue. The voices declaim in a highly dramatic kind of recitative, while the development of the musical ideas is assigned to the orchestra. The unifying principle of his works is the leitmotiv (q.v.), which constitutes the basis of the *musical drama* (q.v.). The music-drama is a combination of the dramatic, musical, and plastic arts into one new art-form. Wagner demands first of all a *drama*, not a text or libretto (q.v.); all the resources of music are to be employed toward a true interpretation of this drama; and the plastic arts are to combine with music. The orchestra is enormously enriched by new tone-colors and means of expression. (See MELOS; OPERA; WAGNER.) Liszt applied Wagner's principle of descriptive music to purely instrumental music, and became an exponent of 'programme music' (q.v.). Unable to make the classic form of the symphony serve his purpose, he invented the *symphony poem*. In the field of piano-music he becomes the originator, with Schumann and Chopin, of modern piano-forte technique. Together with Wagner and Berlioz he also laid the foundations of a new school of conducting (the interpretative-conductor). (See CONDUCTOR; LISZT.) Brahms, in an age of musical excitement and innovations, stands forth as the keeper of classical forms. He successfully carries on the style of Beethoven's third period, faithfully preserving the form, but showing the possibility of filling it with new and original contents. Thus he proves that absolute music is unlimited in its scope and power of expression; that its capabilities were not exhausted even by the titanic Beethoven; that any original genius can employ those forms for conveying his ideas; that the polyphonic art of Bach can successfully be combined with the homophonic-harmonic art of Beethoven and with Romanticism. See BRAHMS.

XXVI. *The Berlin Academicians* (1830-1900).—While Brahms was not hostile to the development of music, a number of composers refused to recognize that Romanticism was an advance in the art of music. They closed themselves to the new influences and sought their ideals in the past. The strongholds of this school were several Berlin institutions, notably the *Singakademie*. (See CHORAL SOCIETIES.) The energies of these masters were directed to the cultivation of the polyphonic style of the older Italian schools and Bach. But some of the later masters finally adopted the principles of Romanticism. The important names are: Dehn, Grell, Kiel, Bargiel, Blumner, Becker, Bruch, Hofmann, Herzogenberg, Gernsheim.

XXVII. *The Neo-German School* (1847—).—The beginning of Liszt's activity in Weimar in 1847 may be regarded as the commencement of this school. Liszt attracted a great number of young musicians who enthusiastically devoted themselves to the cultivation of programme music, carrying out Liszt's ideas. But the Neo-German masters did not devote their energies

entirely to the field of instrumental music. Wagner's works attracted more and more admirers, and composers began to imitate him. Up to the present day a great many dramatic works constructed upon Wagner's principles have been written. The failure of all would seem to indicate that one might almost be justified in stating that Wagner's art-form is one suited to his own gigantic genius, but hopeless for lesser masters. This would seem to be confirmed by the fact that the new dramatic works that have achieved success are all by non-German composers who adopted many of Wagner's ideas, but not his form *in toto*. The Neo-German School has been marked by earnest effort, but its composers have made no lasting impression. The only one whose work seems destined to outlive contemporary criticism is Richard Strauss, a man of pronounced originality and as a master of orchestration equal to Wagner himself. The dramatic composers of this school are: Cornelius, Ritter, Bungert, Kistler, Humperdinck, Kienzl, D'Albert, Weingartner, Schillings, S. Wagner. The instrumental composers are represented by: Krug, Nicodé, Mahler, Hausegger.

XXVIII. *The Modern Italian School* (1851—).—Beginning about 1750, the history of Italian music is practically the history of the decline of the opera. When Verdi scored his first success in 1839 no one dreamt that this man, beginning in the degenerate style, would raise the Italian opera to a high level. In *Rigoletto* (1851) there is a very perceptible effort for dramatic truth and characterization, which the school of Bel Canto entirely ignored. The successive works advance along this line until in *Aida* (1872) we have a rare combination of exquisite melody, dramatic characterization, and truth of expression. *Otello* (1887) and *Falstaff* (1893) mark the culmination of Italian opera. Wagner's principle of dramatic truth is strictly observed. Nevertheless these works are not imitations of Wagner. Verdi has retained all the forms of the opera, but has knit them together into an artistic whole. The principle of the leitmotiv is not used. The orchestration shows a mastery never exhibited by any previous Italian composer. The influence of Verdi is noticeable in a number of composers known as the *Veriotic School* (Mascagni, Leoncavallo), who for some years attracted much attention. Among the many operatic composers, none of whom can approach Verdi, the following deserve mention: Boito, Ponchielli, Marchetti, Faccio, Coronaro, Puccini, Smareglia. The elevating influence Verdi exerted upon dramatic music turned some serious composers to the field of instrumental and choral music, which had been sadly neglected in Italy. The principal instrumental and choral composers are: Pinelli, Sgambati, Cesi, Grazzini, Mancinelli, Martucci, Franchetti, Perosi.

XXIX. *The Modern French School* (1830—).—So far we have spoken of musical development in France only in connection with the theatre. Instrumental music had not been cultivated to a very great extent. But we cannot disregard the name of the family of Couperin during the seventeenth and eighteenth centuries. Several members have become famous through their contribution to the perfection of the suite-form. Under section XXII. the history of dramatic music up to the death of Meyerbeer has been given. Berlioz first awakened a deeper in-

terest in instrumental music. This master was led to instrumental composition through the influence of Beethoven, but, uninspired by the classic forms, he became the originator of programme music (q.v.). His works, all conceived in large forms, lack symmetry of construction and have not yet found universal recognition. But Berlioz first aroused general interest in France for instrumental music and, independently of Wagner, did much for the art of orchestration. Soon other composers began to cultivate instrumental music; and these used the classical forms. After Berlioz's ideas of programme music had been adopted by Liszt, who established the symphonic poem as a recognized art-form, French composers accepted the idea. All through the past century German classical and romantic influences have been at work in France. The mingling of these influences with the individuality of the French masters has been productive of excellent results, and to-day France can boast an influential instrumental school. The principal masters are: David, Franck, Lalo, Saint-Saëns, Bizet, Delibes, Godard, d'Indy, Chausson, Chaminade, Halm. But dramatic music did not remain at a standstill; the German romantic opera and lyric drama influenced French dramatic composers. Although the grand opera (the historic and heroic opera of Meyerbeer) was in danger of losing sight of dramatic truth in its striving after mere effect, the *opéra comique* and the later lyrical French drama are distinguished for truth of expression and successful musical characterization. Wagner's works have exerted only a wholesome influence, for French composers wisely did not imitate his form, but only followed the German master in the art of orchestration, as well as in a few other principles which can be safely adopted without danger of losing individuality. The most prominent dramatic composers are: Gounod, Saint-Saëns, Bizet, Massenet, Chabrier, Guiraud, Reyer, Massé, Bruneau.

XXX. *The Polish School* (1830—).—The Slavic and Scandinavian nations took no important part in the development of music until the last century. (For a complete account the reader is referred to the articles on SCANDINAVIAN MUSIC and SLAVONIC MUSIC.) Polish music is chiefly represented by the works of Chopin, who is one of the founders of a new school of piano-playing. His original harmonic combinations have become a great means in modern emotional expression. He also showed how embellishments can be made an important factor of expression. The other Polish masters show less national characteristics, and those living at present in Germany are more German than Polish. The principal Polish masters are: Moniuszko, Kurpinski, Dobrzynski, X. and Ph. Scharwenka, and Moszkowski.

XXXI. *The Russian School* (1836—).—The beginning of a distinct school may be dated from the first performance of Glinka's *Life for the Czar*. At first the national school cultivated chiefly dramatic composition, but soon composers turned also to instrumental music, in which line several have achieved marked success. The characteristics of Russian music are strength and great variety of rhythm, amounting almost to irregularity. The prominent masters are: Borntianski, Verstowski, Glinka, Dargomyski, Seroff, Borodin, Cui, Balakireff, Mussorgski,

Tschaikowsky, Rimski-Korsakoff, Arenski, Glasunoff, Rubinstein.

XXXII. *The Scandinavian School* (1840—).—Like the Russians, the Scandinavians established a distinct school by emphasizing the national element in music as it was presented in their folk-music. Denmark made the beginning, but Norway soon took the lead. The characteristics of the school are an artistic use of dissonances and an emphasis of rhythm, rather than of melody. The principal masters are: (Denmark) Berggreen, Hartmann, Gade, Enna; (Sweden) Hallstroem, Södermann, Hallén, Sjögren; (Norway) Kjerulf, Svendsen, Nordraak, Grieg, Sinding. See SCANDINAVIAN MUSIC.

XXXIII. *The Bohemian School* (1866—).—The attempts of Russian composers to establish a national opera led Bohemian musicians to make the same experiment in their own country. A distinct Bohemian school may be said to begin with Smetana's *The Bartered Bride* (1866). Smetana also was the first notable instrumental master. He, and still more Dvorák, have made the Bohemian school famous, but the merit of the instrumental works overbalances that of the dramatic compositions. The forms cultivated are those of the German classic and romantic masters. The principal composers are: Schräup, Skuhersky, Schebor, Rozkosny, Smetana, Dvorák, Fibich. See SLAVONIC MUSIC.

XXXIV. *The Modern School of the Netherlands* (c.1800—).—Although after the time of the great contrapuntal schools of the fifteenth and sixteenth centuries we meet no distinct school in the Netherlands, music was not neglected in those countries. But the influences of the neighboring countries, France, and especially Germany, always predominated, thus preventing the rise of a national school. Both Belgium and Holland have produced a number of excellent composers. But the importance of the Netherlands during the nineteenth century rests more upon the contributions to musical history. In this line Belgian writers are second to none in the world. Without the labors of Fétis, Cousse-maker, and Gevaert our knowledge of the musical past would be very incomplete. Besides, Belgium has produced some of the greatest instrumental performers (De Bériot, Vieuxtemps, Léonard, Servais). The more prominent of the composers are: (Belgium) Janssens, Benoit, Mertens, Wouters, van den Eeden, Tinel, Mathieu, Gilson; (Holland) Verhulst, Koning, Coenen, Silas, Hol, Thooft, de Hartog.

XXXV. *The Modern English School* (1830—).—The predominance of spoken dialogue had caused the downfall of the English opera. About 1830 some English composers attempted to write national operas with a moderate amount of dialogue. The works of Weber assisted them in their efforts, but as these earlier works were of a lighter character English opera soon assumed the character of operetta. The appearance of Sullivan established this form upon a firm basis. In the field of grand opera England has as yet produced no successful work. The cultivation of instrumental music, through the influence of Beethoven, has yielded more satisfactory results, but the best work has been accomplished in the field of choral music. The modern English composers have not succeeded in developing a characteristic style, but their works show solid workmanship and mastery of form. The weak point

is thematic invention; the themes lack spontaneity. The list of English composers is a very long one. The following deserve special mention: (Dramatic music) Bishop, Balfe, Barnett, Macfarren, Wallace, Benedict, Sullivan, Stanford; (Instrumental and choral music) Costa, Bennett, Barnby, Stainer, Parry, Cowen, Mackenzie, Coleridge-Taylor.

XXXVI. *The American School* (1880—).—We have seen that the English school of the Restoration (XV.) was obliged to rebuild what the Puritans had destroyed. Music beginning in America with the Puritan psalm-tunes and under Puritan influence naturally could not develop. Its growth came only with foreign influences; and even then considerable time had to elapse before any works by American composers appeared. Even at this present day there is no American school showing distinctive traits; the best works show German influences. The use of American themes (negro or Indian melodies) adds perhaps local color, but is not sufficient to create a school. It is a significant fact that the best works in which national themes are employed were written by a Bohemian, Dvořák. Among the composers who have produced works of sterling merit are: Gilchrist, Foote, Chadwick, Bird, Horatio Parker, van der Stucken, Klein, MacDowell.

Ambros, *Geschichte der Musik* (Leipzig, 1887-91); W. Langhans, *Geschichte der Musik im 17., 18., 19. Jahrhundert* (Leipzig, 1884-87); A. Svoboda, *Illustrierte Musikgeschichte* (Stuttgart, 1892); E. Naumann, *Musikgeschichte* (Berlin, 1885), translated also into English by F. Praeger (London, n. d.); A. Soubies, *Histoire de la musique* (Paris, 1900).

MUSICAL ART SOCIETY. See **CHORAL SOCIETIES**.

MUSICAL DICTATION. A branch of musical training of very recent date. The instructor sings or plays short musical selections or phrases which the pupil is required to fix in musical notation on paper. The object of musical dictation is not only to train the ear, but chiefly to develop the power of quickly grasping and fixing musical ideas. The beginning is made of course with simple melodies progressing in simple intervals. Gradually melodies with more difficult intervals are introduced. The next step is to melodies with a simple harmonic basis. A class for musical dictation was established at the Conservatory in Paris in 1871. Some of the German conservatories soon followed (Hamburg; Dresden, Karlsruhe, etc.). An elaborate treatise on the subject was published by A. Lavignac, *Cours complet de dictée musicale* (Paris, 1882). Smaller works are: Götze, *Musikalische Schreibübungen* (Breslau, 1882); and *Musical Dictation* (London, 1886) by Dr. Ritter (in Novello's series of Music Primers).

MUSICAL DRAMA, or **MUSIKEDRAMA**. A term now generally employed to distinguish the later works of Wagner (*Tristan und Isolde*, *Die Meistersinger*, *Die Nibelungen*, *Parsifal*) from

his earlier ones, or operas (*Rienzi*, *Der fliegende Holländer*, *Tannhäuser*, *Lohengrin*). Of a musicodramatic work Wagner demands that the literary drama be the *first* and music the *second* consideration; whereas in the opera the music was almost the sole consideration. In his introduction to *Oper und Drama* Wagner declares emphatically: "The error in the art-form of the Opera consisted in the fact that a *means* of expression (music) was made the *end*; the *end* of expression (the drama) a *means*." After *Lohengrin* Wagner wrote chiefly theoretical works dealing with the method to be followed by the poet and composer in the production of a new form of art, which was to take the place of the opera. Several years elapsed before he began the composition of *Die Nibelungen*, according to his new artistic convictions. In the musical drama the fundamental material from which the music is constructed is the *leading motive*. (See **LEITMOTIV**.) By this means artistic unity is obtained, whereas in the opera the different numbers may be artistic wholes, but can never be welded intimately together into the higher unity of the entire drama. Wagner's musical dramas have exerted a powerful and lasting influence upon all dramatic composers. For full information, the reader is referred to Wagner's *Oper und Drama*, vols. iii.-iv. of his *Gesammelte Schriften und Dichtungen*, (Leipzig, 1887); *Das Kunstwerk der Zukunft*, vol. iii. of same ed.; *Eine Mitteilung an meine Freunde*, vol. iv.; *Zukunftsmusik*, vol. vii. See also articles **MELOS**; **OPERA**; **WAGNER**.

MUSICAL FESTIVAL. The performance of some large choral or orchestral work with a very large chorus or orchestra. The real era of musical festivals begins with the festival performances of the great Handel Commemoration held from 1784 to 1787 and again in 1791. It is true that previous to this time regular musical festivals were held in England; but they were practically unknown on the Continent. In England choral singing had always been more extensively cultivated than in any other European country, and the efficiency of English choirs led Handel to turn his attention in the direction of writing for large choral bodies in his oratorios. Since the first performance of the *Messiah* in 1749 it has remained a custom in London to perform that work with greatly augmented chorus and orchestra every year at Christmas. These performances on a grand scale in the English capital roused a feeling of national pride in the Germans, who felt that the great master belonged to them by birth. Festival performances of Handel's oratorios were first given in Berlin on the London plan and were imitated in other German cities. Soon the works of other composers were performed in a similar manner. And as on such occasions there was always a large orchestra, it was but natural that this body of instrumentalists was utilized in the performance of large orchestral works. Thus at the beginning of the nineteenth century several organizations devoting their energies to the production of any great work, whether choral or purely instrumental, sprang into existence in various parts of Germany. Among these the oldest and even to-day most famous are the *Gesellschaft der Musikfreunde* in Vienna and the *Niederrheinische Musikfeste*, which take place yearly in some city of

the Lower Rhine District. The United States has not been behind in following the example of England and Germany, and many festivals are held almost yearly in several of the larger cities. On such occasions it is nothing unusual to find a chorus numbering from one to two thousand voices and an orchestra of from one to two hundred performers. These musical festivals have also powerfully affected the mode of conducting and have done very much toward establishing the universal custom of conducting by means of the *bâton*. Whereas formerly the conductor always presided at the piano, the handling of large bodies of singers and players necessitated the undivided attention of the conductor upon those whom he directed; and the singers, in turn, became likewise more dependent upon signs and gestures from the conductor. (See CONDUCTOR.) For an account of the principal musical festivals, see BAYREUTH MUSICAL FESTIVAL; BETHLEHEM MUSICAL FESTIVAL; CINCINNATI MUSICAL FESTIVAL; GESELLSCHAFT DER ÖSTERREICHISCHEN MUSIKFREUNDE; GEWANDHAUSCONCERTS; LEEDS MUSICAL FESTIVAL; LOWER RHENISH MUSICAL FESTIVAL; SACRED HARMONIC SOCIETY; SALZBURG FESTIVAL; SOCIÉTÉ DES CONCERTS DU CONSERVATOIRE; SONS OF THE CLERGY; TONKÜNSTLER-SOCIÉTÄT; MUSICAL SOCIETY OF LONDON; THREE CHOIRS FESTIVAL; WORCESTER FESTIVAL.

MUSICAL INSTRUMENTS. The origin of many musical instruments dates back to the earliest times. Not a few of these ancient instruments are the prototypes of some of our modern ones. Monuments recently unearthed at Thebes and in the upper valley of the Nile contain representations of harps and flutes; and the relation of our modern instruments to the old Egyptian models is not difficult to perceive. In the case of other instruments the relationship is not so easy to trace, owing to the considerable modifications which they underwent in the course of centuries and in passing from one nation to another. Even so recent an instrument as our grand pianoforte can be traced through its many and vital changes to the dulcimer (q.v.) known to the Arabs and Persians. Hand in hand with the evolution of the art of music went the invention and perfection of musical instruments. Many of these were extensively used and admired in their day, but soon were superseded, so that to-day our museums are filled with various instruments of all times and nations preserved only as curiosities. Thus the large family of lutes is now entirely obsolete; and yet at one time these instruments enjoyed the same popularity as the pianoforte does to-day, and no orchestra was complete without them. If we except the stringed instruments, it may safely be asserted that no instrument found in the modern orchestra is the same as it was a century ago. All the instruments of the woodwind family have been vastly improved; the natural horns and trumpets have given way to the improved valve horns and trumpets; the serpents and ophicleides have been entirely superseded by the trombones and tubas. It may be said that the modern orchestra comprises the best and most efficient instruments now known, and the test for admission into this select family is sonority and beauty of sound. Musical instruments are generally divided into four large groups, according to the manner in

which the sound is produced, viz.: (1) stringed instruments, (2) wind instruments, (3) instruments of percussion, (4) keyed instruments. This latter group embraces the organ and pianoforte, the former being really a wind, the latter a stringed instrument. Both differ from the other instruments of those groups in the use of a keyboard.

STRINGED INSTRUMENTS. Stringed instruments are divided into two principal classes: (A) Those in which the tone is produced by drawing a bow made of horse-hair across the strings. (B) Those in which the tone is produced by plucking the string either with the fingers or a small instrument called *plectrum*. The instruments of class A have but few strings (generally four), and depend for the production of their complete range upon stopping, i.e. shortening the vibrating portion of the string by means of the fingers. To this class belong (1) the violin, (2) the viola, (3) the violoncello, (4) the double bass. (See the separate articles.) Some of the instruments of class B have few strings like those of class A; others have a separate string for each note. Those having few strings are: (1) the mandolin, (2) the guitar, (3) the banjo. Those having many separate strings: (1) the zither, (2) the harp. (See the separate articles.) Formerly there were in use instruments that were played with a bow, which also had additional strings to be plucked with the fingers. (See THEORBO.) Among the stringed instruments by far the most important are those constituting the viol family (class A). The present perfection of these instruments is the result of a slow evolution of possibly a thousand years. But so far we have no evidence whatever that any instruments of the viol family were known in antiquity. Because Arabic authors of the fourteenth century mention stringed instruments, it was supposed for some time that viols originated in the Orient. This has been disproved by Gerbert, who in the second volume of his *Musica Sacra* published a representation of a European stringed *lyra* of the ninth century very similar in shape to the later *giga*. Even earlier, however, the crowd (q.v.) was known in Wales. For several centuries viols were built in two shapes, either with a flat body like the violin or with a pear-shaped body like the mandolin. During the fifteenth and sixteenth centuries stringed instruments of all possible varieties of shapes were built. These, however, were all superseded in the course of the following two centuries, when the art of violin-making reached its height. After the violin had been perfected the same attention was also bestowed upon the instruments of lower pitch of this family, such as the bratsche, viola da gamba, viola d'amore, etc. (See VIOLIN; VIOLONCELLO.) A full account of how the viol family came to be the foundation of the modern orchestra will be found under ORCHESTRA.

WIND INSTRUMENTS. Under this heading are included all instruments on which the tone is produced by setting a column of air in motion. According to the material from which they are made, they are subdivided into: (A) Woodwind instruments, (B) brass instruments. Many of the wind class are transposing instruments, i.e. the tones actually produced upon them are not the same as those written for them. Let us take the clarinet family as an example. The

MUSICAL INSTRUMENTS

- | | | | |
|----------------|-------------------|----------------|-------------|
| 1. ÆOLIAN HARP | 4. CROWD or CRWTH | 7. COR ANGLAIS | 10. REBEC |
| 2. THEORBO | 5. HURDY-GURDY | 8. BARYTON | 11. SHOPHAR |
| 3. LUTE | 6. ALPENHORN | 9. MONOCHORD | 12. LYRE |
- From the Crosby Brown Collection in the Metropolitan Museum of Art, New York

compass of the clarinet in C is from *e* to *c'*. It is possible to obtain notes below and above this range by building clarinets in different keys. Thus the clarinet in A produces the same series of tones a minor third lower, so that the lowest tone is *c*[♭] and the highest *a'*. The clarinet in *E*_b produces the tones a minor third higher, so that its lowest tone is *g* and its highest *eb'*. Hence the music for any transposing instrument must be written in a key *above* or *below* the key of the composition by the same interval as the key of the instrument is *below* or *above* C. For instance, a piece is written in *A*_b major and the composer desires to employ the *E*_b clarinet. Since every tone sounds a minor third higher than the written note, it is necessary to write this particular clarinet part in a key lying a minor third below *A*_b, i.e. in F. See TRANSPOSING INSTRUMENTS.

A. *The Wood-wind*.—The instruments belonging to this class are generally made of wood, but ivory is also used, and quite recently flutes have been made of silver. The instruments of the wood-wind family are: (1) the flute; (2) the piccolo (a small flute with very shrill tones); (3) the oboe; (4) the English horn; (5) the clarinet; (6) the bassoon; (7) the double or contra bassoon; (8) the flageolet. (See the separate articles.) This last instrument was extensively employed by Gluck and Mozart, but is now obsolete. Of the wood-wind instruments the English horn and the clarinet are transposing instruments, as was also the flageolet. All the wood-wind instruments have a rich, mellow tone approaching that of the human voice more closely than any other instruments.

B. *The Brass*.—The members of this class consist of (1) the horn; (2) the cornet; (3) the trumpet; (4) the trombone; (5) the tuba; (6) the ophicleide; (7) the serpent. (See the separate articles.) The two last named are obsolete. With the exception of the trombone, all these instruments are transposing instruments. The tones produced by brass instruments are distinguished as *natural* and *harmonic* tones. The former are produced upon the open tube by regulating the force of the air-current by means of the lips; the successive tones produced are the harmonics or overtones of the fundamental. (See HARMONICS.) All tones produced by the aid of the valves are called harmonic tones. In the case of the trombone the length of the vibrating air-column is not regulated by valves, but by a slide. Formerly the horns and trumpets had no valves, and these instruments are to-day called *natural* horns and trumpets. To produce a complete scale on them it was necessary to insert the left hand in the opening. They have now been entirely superseded by the valve-horns and trumpets. The trumpets must have undergone considerable change since the days of Bach and Handel, for in the works of these masters we find passages written for trumpets which no one can execute to-day. All the brass instruments are built in many keys, so that it is easily possible to write four-part harmony for only one group of brass instruments. For instance, in the case of trombones there are four varieties: the alto, tenor, bass, and double-bass trombone. The latest additions to the family of brass instruments are the tubas, which Wagner had constructed especially for his *Ring der Nibelungen*. See TUBA.

INSTRUMENTS OF PERCUSSION. The instruments of percussion may be divided into two principal classes: (A) Those which have definite pitch; (B) those which have not. The former class comprises (1) the kettle-drums; (2) the glockenspiel; (3) the xylophone. The latter class includes: (1) the bass drum; (2) the small drums; (3) the tambourine; (4) the tamtam; (5) the cymbals; (6) the triangle; (7) the castanets. (See the separate articles.) The chief use of instruments of percussion is for marking the rhythm. Those instruments that are devoid of definite pitch are capable only of rhythmic figures; whereas the glockenspiel and xylophone can play melodic figures as well. Of all the instruments of percussion the kettle-drums are the most important and most generally used.

For description of the keyed instruments (*piano-forte* and *organ*), the reader is referred to the extensive special articles.

Under the above headings the instruments at present in use in the orchestra have been described in their general features and especially in their relation to other members of the same family. Besides the instruments mentioned, many others have been in use in former times. There are still others in actual use, but as they are not employed for music of a high character, they have not been discussed. Then there is still another class of instruments recently invented, which, however, have not yet come into general use, as the saxophone (q.v.). The following is a list of instruments of these classes: alpenhorn, bagpipe, basset-horn, bugle, cembal d'amore, chimes, clavichord, concertina, crowd, dulcimer, flügelhorn, glasschord, harpsichord, hurdy-gurdy, jews-harp, kazoo, krummhorn, lur, lute, lyre, ocarina, psalter, sarrusophone, saxophone, shawm, spinet, theorbo, viol, virginal. Instruments of the nations of antiquity and of Oriental nations are treated in the special articles on the music of those nations.

Besides the instruments employed in musical performances, there are a few that are built solely for the purpose of acoustic experiments. These are (1) the monochord; (2) the siren; (3) the tuning-fork (qq.v.).

Among the most valuable works on the history of musical instruments may be mentioned: Wasielewski, *Geschichte der Instrumentalmusik im XVI. Jahrhundert* (Berlin, 1878); Comettant, *La musique, les musiciens et les instruments de musique chez les différents peuples du monde* (Paris, 1869); Vidal, *Les instruments à archet* (ib., 1878); Schletterer, *Die Ahnen moderner Musikinstrumente* (Leipzig, 1882); Hofmann, *Katechismus der Musikinstrumente* (ib., 1890); John Hawkins, *General History of the Science and Practice of Music* (originally published in five volumes in 1776, reprinted in two volumes, London, 1875). This latter work is particularly valuable for its many cuts of now obsolete instruments.

MUSICAL NOTATION. The art of expressing musical compositions in writing by means of certain conventional signs called notes. The oldest system of notation of which we have any knowledge is the *alphabetical notation* of the Greeks. The detailed descriptions of this system left to us enable us to decipher without much difficulty the few remnants of Greek music re-

cently discovered. The Greeks employed uncial letters which appeared in a great variety of positions—inverted, sideways, divided in halves, etc. Thus no less than 120 different combinations were obtained.

Example 1.

ABFΔEZHΘI
·/·N·T·A·E·H·S

Long after the downfall of Greece this system of notation remained in use, especially in the writings of the theorists. During the sixth century A.D. Roman letters were first used. Boëthius employed the first fifteen letters of the alphabet. But these were later reduced to seven and applied to the degrees of the scale. These letters—as the Greek letters had also been—were placed in a straight line above the syllables of the words. Although in themselves sufficiently definite, the letters did not present to the eye the rising or falling of the melody, as does our modern notation. This need gave rise, in the eighth century, to a series of dots, hooks, curves, and peculiar figures which were placed above the syllables of the text at distances proportionate to the musical pitch of the note. These characters are known as *Neumes*. (See NEUMES.) From a combination of the signs of these Neumes and the alphabetical notation arose our modern system. But its progress was slow, and the complex system of *mensurable music* (q.v.) had first to outlive itself before the present simpler system was established.

THE STAVE. The introduction of lines we owe to the Neumes. In the tenth century Hucbald took up the idea of using lines. He wrote the syllables between the lines, and at the beginning he indicated by the letters T and S whether the voice was to proceed by tones or semitones.

Example 2

This, in modern notation, reads

Example 8

By increasing the number of lines Hucbald was enabled to write even four-part compositions in this manner. Soon after his time dots were used *on the lines*, leaving the spaces vacant, and the degree of the scale was indicated by a Greek letter placed at the beginning of each line. But the great number of lines necessary rendered the reading of this manner of notation difficult, and it was soon abandoned. Guido of Arezzo in the eleventh century added two black lines to the red and yellow lines of the Neumes, in such a manner that the upper black line above the yellow represented E, and the second black line, drawn between the yellow and red lines, A.

Example 4.

Example 7.

E	_____	black
C	_____	yellow
A	_____	black
F	_____	red

Whereas before his time only the spaces *or* the lines had been used, Guido made use of both

lines *and* spaces. The advantages of this system were so obvious that this stave was soon adopted in every country of Europe. As long as music was homophonous, i.e. consisted of only a single melody, this stave answered all purposes. But the growth of polyphony soon rendered a greater number of lines and spaces an absolute necessity. No one seems to have thought of the simple idea of writing each voice on a separate stave. Instead the four lines were extended to six, eight, twelve, and even more. In the Paris Library there is a score, dating from the middle of the thirteenth century, in which all the voices are written on a single stave. The difficulty of reading scores written in this manner led musicians to adopt a uniform stave of nine lines arranged in two groups, each containing four black lines. The two groups were separated by a red line. In the fifteenth century we find three staves employed for different kinds of music. Plain chant melodies were written on a stave of four lines; all other vocal music on a stave of five lines; and a stave of six lines was used for all compositions written for the organ and virginal. After the invention of music-printing the five-line stave became the universal standard of all music, except the plain chant melodies, which to this day are written on a stave of four lines.

THE FORM OF THE NOTES. As long as music had no distinctive rhythm of its own and the musical accents were determined only by the word-accent, Guido's system of using simple dots answered all purposes. But it was not long before the need of notes having a fixed time-value made itself felt. Franco of Cologne, in the twelfth century, replaced the dots by notes of various shapes to indicate their relative duration. He also indicated the time-value of pauses or rests by a series of signs corresponding in duration to the different notes. A full account of this elaborate and difficult system will be found under **MENSURABLE MUSIC**. This system has become the foundation of our modern system of notation. The notes of larger value, the *large*, *long*, and *breve*, have disappeared, the *semibreve* having become our standard of value or *whole* note. The development of instrumental music during the eighteenth century brought with it a great advance in the technique of the instruments, and this led composers to write passages requiring more rapidity of execution than is possible to obtain from choral masses. Round notes were substituted for the square ones, because the former can be written more easily and rapidly. Another important innovation, and one which greatly facilitated the reading of scores, was the joining of all notes having hooks into groups readily recognized by the eye. Thus a passage which formerly was written

Example 5.

Whereas formerly the *semifusa* (corresponding to our sixteenth) was the note of smallest value, the increased rapidity rendered possible by in-

strumental technique led to a subdivision of sixteenths into thirty-seconds, and of these latter even into sixty-fourths. The signs denoting the rests in mensurable music have been adopted into the modern system without modification.

THE CLEFS. The oldest of the clefs is the F clef, which in its original form as a red line dates back to the tenth century. Almost as old is the C clef, which originally was a yellow line. These colored lines were used without a clef signature, as it was understood that every note upon the red line represented F, and every note upon the yellow line C. Later on the colored lines disappeared, black ones being substituted and the letter F or C placed at the beginning. (See NEUMES.) The modern forms of these clefs are the result of a series of modifications of the plain letters.

The G clef is more recent than the other two, but its present form is the result of similar changes of the letter G.

Example 6.

Originally the different clefs had no fixed position as they have to-day. In order to avoid the use of ledger-lines (which, in fact, were unknown), the position of the clefs was constantly shifted, so as to bring the range of every voice within the limits of the stave. In old manuscripts we find every clef, at various times, on every line of the stave. Even within the same melody the clef changes frequently. This arbitrary use of the clefs continued until the seventeenth century. The establishment of opera (q.v.) brought with it the introduction of many new instruments. To bring the range of all these instruments within the limits of the stave could not be accomplished any longer by the transposition of clefs. Previously some polyphonic writers of the sixteenth century had on very rare occasions resorted to the use of a single ledger-line above or below the stave. This idea was taken up by the operatic composers, and thus ledger-lines became a fixture in music. Now that there was no longer any need for the constant transposition of clefs, the positions of those that remained in use became definitely fixed. Each voice-part had its own clef, as also the violin:

Example 7.

In this form the classic masters have used the clefs. For the pianoforte the G and F clefs are used; the higher pitched orchestral instruments play with the G clef, those of lower pitch the F clef. The viola is the only one for which the alto clef (C) is retained. During the nineteenth century the C clefs have been superseded even in vocal music by the G clef.

TIME-SIGNATURES. Before the introduction of mensurable music there was no need of time signatures. The signatures used in mensurable music will be found in the special article on

MENSURABLE MUSIC. When, in the seventeenth century, the bar was introduced, composers soon saw an opportunity for reducing the very complicated and cumbersome time-signatures of mensurable music. The underlying principle of rhythmic division into binary and ternary forms still remained the basis. But, whereas in the older system ternary division (perfect) was the principal consideration and binary division (imperfect) only secondary, the new system inverted these relations by recognizing only binary division as natural. Ternary division was retained, but was regarded only as a modification of the natural binary division and obtained by the use of a dot which increased the value of the note by one-half. Moreover, all notes were referred to the whole note (the semibreve of mensurable music) as the standard of value. Thus the whole note was divided into two half notes, each half note into two quarters, etc. The time-signatures of this new system were expressed by fractions, the denominators indicating the subdivision of the standard whole note, and the numerators the number of subdivided notes to be allotted to each measure. The only signs still retained from mensurable music are the semicircle for common time (four quarters in a measure) and the semicircle with a line (alla breve), where the line still has the meaning of reducing the notes to half their duration.

THE BAR. The earliest example of the use of vertical bars is found in Agricola's *Musica Instrumentalis*, which was published in 1528. The object of these bars, however, was only to keep the notes of the different voices one under the other, rather than to indicate rhythmic divisions. A few original drafts of older compositions give evidence that composers during actual composition did use bars to indicate the rhythm, although all the part-books up to the seventeenth century were printed without bars. The general use of bars we owe to the early composers of operas. Peri, in 1600, published the score of his *Eurydice* exactly as he had written it. In order to indicate clearly the connection between the different notes in the voices and accompanying instruments he drew vertical lines through the whole length of the stave. Caccini and Monteverde adopted this plan. The great facility of reading music printed in this way immediately led to its universal adoption. The new system of music, having established new signatures for time, allotted a certain number of beats to each bar, and in this way the bar became what it is to-day.

ACCIDENTALS. In spite of the strict laws governing plain chant and the use of the old Church modes, the human ear from the earliest times felt the need of a 'leading tone.' The tone of the scale that was subject to this modification was B. Thus at a very early time this letter was written in round (b) and later square (♭) form to indicate whether the lower or higher tone was to be sung. It is easy to see how from these two forms arose our flat and natural (♭). Toward the end of the thirteenth century the sign ♭ was carelessly written #, and being applied to other tones than B, denoted the higher of the tones on the same degree. Thus, F# denoted the modern F#, but F♭ was the same as our F natural, just as B♭ was regarded as the natural tone and B# (our B) a chromatic alteration of B♭. As a key-

signature the sign $\flat$ appears first in the Church modes, but denoted only a transposition of the original mode. (See *Modes*.) Even in the eighteenth century a $\flat$ was used as a sign of resolution for a note having a $\sharp$ or $\natural$ (these two signs were identical); and vice versa a $\sharp$ or $\natural$ served to resolve a $\flat$. The signs of the double sharp and double flat ($\times$, $\flat\flat$) cannot be traced further back than the beginning of the eighteenth century. The sign $\times$ arose from writing the older $\sharp$ in this position $\times$. Before the beginning of the seventeenth century accidental sharps, flats, or signs of resolution appeared very seldom in writing. The singer was supposed to introduce the necessary chromatic alterations during the actual performance. As long as the Church modes reigned supreme no use was made of regular key-signatures. A flat or sharp placed at the beginning of a piece denoted only transposition. But as soon as the modern major and minor scales displaced the modes the necessity of key-signatures arose, in order to avoid the great number of accidentals.

EXPRESSION MARKS. Toward the end of the eighth century we find in one old manuscript written in *neumes* small letters interspersed with the characters of the *neumes*. These letters refer to the expression. We find a small *f* (*frigor*), *b* or *t* (*bene teneatur* or *teneatur*), *c* (*celeriter*), etc. This manuscript is the famous Antiphony of Saint Gall. The works of the great polyphonic masters of the fifteenth and sixteenth centuries are utterly devoid of any marks of expression, nor are any evidences of expression marks to be found in works written between the eighth and fifteenth centuries. There really was no pressing need for such marks, for all music was vocal, and the text gave a sufficient clew to the singers, who were all thoroughly trained musicians. But the development of instrumental music gave rise to various marks of expression. Hand in hand with the development of instrumental music went the perfection of the musical instruments. Many new effects were discovered, and to express these composers were obliged to use words. Monteverde in his opera *Orfeo* (1608) demands that the trumpets play with mutes, and this is indicated in the score by the words *con sordini*. The same composer introduced a number of new effects in his *Tancredi e Clorinda* (1624), among which were the *tremolo* and the *pizzicato* for strings. Such effects were called for by the actual words placed in the score. These are the earliest instances of expression-marks. Operatic composers immediately followed the practice established by Monteverde. Among the earliest of purely instrumental masters who employed words to help the performers was Frescobaldi (1583-1644). He was particularly careful to indicate the tempo. One of his favorite marks is *adagio*. Soon the words *allegro*, *largo*, *grave*, *moderato* came into general use. In the course of the eighteenth century nearly all the important marks of expression and time were in use. The nineteenth century substituted convenient signs for some of the most frequently recurring marks, such as *crescendo* < , *diminuendo* > , *staccato* *legato* — , *sforzando* $\wedge$ etc., and increased the vocabulary of musical expression considerably. Some of the German masters of the last century, notably Schumann and Wagner, attempted to substitute

a German terminology for the Italian. But the Italian terms are more definite, because two centuries of constant use have familiarized them to musicians of every nationality.

Another system of musical notation used formerly, especially for the lute, is discussed under *TABLATURE*. For the new system of designating chords by figures, used in theoretical treatises, see *NUMERICAL NOTATION*. A complete history of musical notation was written by Riemann: *Studien zur Geschichte der Notenschrift* (Leipzig, 1878); an abridgment of this is the same author's *Die Entwicklung unserer Notenschrift* (ib., 1881); Riemann, *Geschichte der Musiktheorie im IX.-XIX. Jahrhundert* (ib., 1898).

MUSICAL SAND. There are a large number of beaches, oftentimes, however, of very small extent, whose sand has the peculiar property of giving out a distinct musical tone when stepped upon. The musical note appears to depend upon the fact that the grains of sand are of such very uniform size that as they slip past each other under pressure the vibrations of the particles respectively reinforce each other so that sounds which would otherwise be inaudible become distinct, and the crunching noise which is heard when the foot presses down upon snow or ordinary sand becomes a clear musical note.

MUSICAL SOCIETY OF LONDON. A famous English musical society organized at London in 1683. At this period the study of choral music in England had assumed dimensions and a degree of artistic importance far greater than obtained in any other country. The success which had attended the work of 'The Corporation of the Sons of Clergy,' established in 1655 and incorporated by charter of Charles II., in 1678, led to the founding of the Musical Society, the principal function of which organization was the celebration of Saint Cecilia's Day. Among the poets who wrote odes for the society were Dryden and Congreve, and among the composers Purcell and Blow. At the last regular Cecilian festival held in London in 1703 the chorus numbered about thirty boys and as many men, and the orchestra about twenty-five persons. The society still occupies an important position in English musical life.

MUSIC BOX. A case containing mechanism constructed in such a manner that music can be produced automatically. Machines for making mechanical music have been known since the invention of clocks; but real music boxes were not introduced till after 1750. They have been greatly improved since then, and some modern musical boxes can play over 100 tunes. The mechanism is similar to that of the barrel-organ. The principal parts are the comb, the cylinder, and the regulator. Bells, drums, and castanets are frequently added to produce musical effects, and there are occasionally combinations of reeds and pipes. The musical boxes of Prague, Sainte Lusanne in France, and Geneva, Switzerland, are especially famous.

MUSIC-DRAMA. See *MUSICAL DRAMA*.

MUSIC RECORDER. See *MELOGRAPH*.

MU'SIMON. See *MOUFLOU*.

MUSIN, mu'zan', OVIDE (1854—). A Belgian violinist, born at Nandrin, near Liège. He

studied at the Conservatory of that city under Heynberg and Léonard, followed the latter to the Paris Conservatory, where, in 1868, he won a gold medal, and taught for a year before leaving on his European and American concert tours that ultimately led him round the world. In 1898 he became violin professor at the Liège Conservatory, but continued to spend much time in the United States.

MUSK, or **MUSK DEER** (OF., Fr. *musc*, from Lat. *musculus*, from Gk. *μύσχος*, *moschos*, from Ar., Pers. *musk*, musk, from Skt. *mūṣka*, testicle, mouse, from *mūṣ*, to steal). An aberrant deer of the subfamily Moschinee, which differs from ordinary deer in the lack of antlers; in the possession by the male of long upper canines, which project downward outside the lips; and in certain anatomical features. Hence there has been much discussion whether the animal should be included in the Cervidae. There is only one species, *Moschus moschiferus*, of the high Himalayas, Tibet, and Eastern Siberia—a small animal, which stands about 20 inches high and has a clumsy form. Its favorite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued by hunters on account of its odoriferous secretion, which has been known in Europe since the eighth century, and is much valued as a perfume.

MUSK. This secretion is produced in a glandular pouch situated on the hinder part of the abdomen of the males, and its natural use seems to be that of increasing sexual attractiveness. The musk-bag, or 'pod,' is formed by an infolding of a portion of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment; it is reddish-brown, and has an excessively powerful odor. Very little of it reaches Europe unadulterated. Musk is usually imported either in the form of 'grain-musk,' that is, the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown color; or in the 'pod,' dried with the musk inside. Of both kinds the annual importations to the United States are about 15,000 ounces, chiefly from China and India. Small quantities are used in medicine, but the greater part is employed by perfumers. The kinds generally known in trade are the Tonquin or Chinese, and the Carbadine, Kabardine, or Siberian, which is inferior. Genuine musk has the valuable property of adding to the permanency of other odors. On account of its properties as a stimulant and antispasmodic, it is also used to some extent in medicine. See PERFUMERY.

BIBLIOGRAPHY. Lydekker, *Deer of All Lands* (London, 1898); Flower, a monograph in *Proceedings of the Zoölogical Society of London*, 1875. See Plate of FALLOW DEER, MUSK, ETC.

MUSKAT, *mūs-kāt'*. A town of Arabia. See MUSCAT.

MUSK DUCK. (1) A very large Australian sea-duck (*Biziura lobata*), which has a musky odor. The male is decidedly bigger than the female and has a lobe of skin depending from its chin. (2) The Muscovy duck.

MUSKEGON, *mūs-kē'gōn*. A city and the county-seat of Muskegon County, Mich., 40 miles northwest of Grand Rapids; on Muskegon Lake, which is connected with Lake Michigan by a channel 200 feet wide and of ample depth for large vessels, and on three branches of the Pere Marquette, the Grand Rapids and Indiana, and the Toledo, Saginaw and Muskegon railroads (Map: Michigan, G 5). Through the liberality of one of its citizens the city enjoys numerous gifts—a manual training school, a public library, a gymnasium, a square, which is the site of a handsome soldiers' monument and of several bronze statues, and a hospital—for the maintenance of which also the donor has made ample provision. Muskegon has one of the finest harbors on Lake Michigan, open the entire year, which is in daily steamboat communication with Chicago, Milwaukee, and other lake ports. It carries on a large trade in lumber, fruit, celery, and other garden truck, and in the principal manufactures of the place, which include flour, paper, knit goods, furniture, refrigerators, curtain rollers, pianos, chemical engines, electric cranes, beer, and iron and tinplate products. The government is administered, under a charter of 1897, by a mayor, annually elected, a unicameral council, and subordinate municipal officers, chosen by the people. The city owns and operates the water-works. Though a trading post was here established in 1812, Muskegon was not permanently settled until 1834. In 1861 it was incorporated as a village, and eight years later was chartered as a city. Population, in 1890, 22,702; in 1900, 20,818.

MUSKELLUNGE, *mūs'ke-lūnj*. A common variant of maskinonge (q.v.).

MUSKET. See SMALL ARMS.

MUSKHOGEAN (*mūs-kō'gē-an*) **STOCK.** A North American Indian stock which derives its name from Muscogee, the principal tribe of the Creek confederacy. (See CREEKS.) This is one of the most important linguistic stocks of the United States. It formerly occupied the greater portion of the territory of the Gulf States east of the Mississippi, and comprised the Creek, Choctaw-Chickasaw, Seminole, Apalachee, and a number of smaller tribes and bands, speaking perhaps five distinct languages, with several minor dialects. The difference was greatest between the Muscogee and the Choctaw proper, of which the Chickasaw was a dialectic form. The Seminole is a mixed dialect, based chiefly upon Hitchitee, the prevailing language of the 'Lower Creeks,' formerly residing on the Chattahoochee River. The old Mobilian trade language (q.v.) was based upon Choctaw.

According to their traditions the Muskogean tribes came from the West and Northwest, and those who formerly resided nearest the Mississippi, as the Choctaw and Chickasaw, have a clear tradition of having crossed that stream to enter their later territory. The migration must have occurred at a very early period, and they appear to have found the country occupied by other tribes whom they conquered and absorbed. Their authentic history begins with the first landing of the Spaniards on the Gulf coast under Narvaez in 1527. Thirteen years later De Soto traversed their country from east to west, finding the various tribes in practically the same positions which they occupied up to the period

of their final removal to the Indian Territory. For three centuries their history is closely interwoven with that of colonization and conquest by the Spaniards, French, and English in the Southern States. Each tribe or village made such alliances as suited its purpose, with the exception of the Chickasaw, who, like the Iroquois in the North, remained the steady allies of the English, and by their command of the waterway of the Mississippi, were able to check the advance of French colonization by cutting off communication between Louisiana and the Illinois settlements. The Apalachee of Florida were Christianized at an early period by the Spanish Franciscans, but the entire tribe was exterminated by the English and their Indian allies about 1702, and the country left an uninhabited wilderness until it was gradually occupied by vagrant bands from the Creek confederacy, later known as Seminole, or 'runaways.' The Yamasi of South Carolina were driven from their homes in 1715 as a result of a war with the English and retired to Florida. The Muskhoegan tribes played little part in the French and Indian War, but the Creeks took a particularly active part with the English against the Americans in the Revolution. This warlike confederacy again rose against the neighboring American settlements in the War of 1812, and by the opening massacre at Fort Mims and the desperate encounters at Talladega and Horseshoe Bend made the Creek War one of the bloodiest pages in American history. The two Seminole wars, which cost the Government years of effort and over \$40,000,000, further illustrated the fighting temper of the Creek tribes. By these wars and successive treaty sales the Muskhoegan tribes were rapidly dispossessed until by the year 1835 practically the whole body had been removed to the west of the Mississippi. Here the four principal tribes, the Creek, Choctaw, Chickasaw, and Seminole, reestablished themselves as 'nations' under organized governmental forms in the Indian Territory, where they now reside, with a combined population of pure and mixed blood, exclusive of adopted aliens, of perhaps 33,000 persons, besides some 2000 more in detached bands in Florida, Mississippi, Louisiana, and Texas.

All the Muskhoegan tribes were sedentary and agricultural, residing in compact and regular towns and villages, frequently palisaded, and always with a central 'town house' for councils and other public ceremonies, fronting upon a plaza or public square for outdoor gatherings. Their social organization was complex and exact, the rank and duty of each clan being specifically fixed in the tribe. They were a virile race and have maintained their population and tribal organization against all the wasting effect of contact with white civilization. Much study has been given to their language, particularly the Muscogee and Choctaw, of which there is a considerable body of native literature. The best summaries of their characteristics and history are: Adair, *History of the American Indians* (London, 1775); Hawkins, *Sketch of the Creek Country*; and Gatschet, *Migration Legend of the Creek Indians* (Philadelphia, 1884-88).

MUSK HYACINTH. A bulbous plant. See GRAPE HYACINTH.

MUSKINGUM, müs-kŭ'gŭm. The principal river of eastern Ohio. It is formed at Co-

shocton by the junction of the Walhonding and Tuscarawas rivers, and flows southeastward 112 miles through a rich agricultural region, entering the Ohio River at Marietta (Map: Ohio, G 6). The Ohio and Erie Canal follows its course as far as Zanesville, and slackwater navigation has been secured to Dresden, 92 miles from the mouth of the river.

MUSK MALLOW. A tropical plant. See MALLOW; HIBISCUS.

MUSKMELON (so called from its peculiar aromatic flavor), *Cucumis Melo*. An annual herbaceous vine of the natural order Cucurbitaceæ, a native of the warmer parts of Asia and now cultivated in both hemispheres for the sake of its rounded or ovate fruit, which, in its numerous varieties, varies from a few inches to more than a foot in diameter. Some varieties are distinguished by a thick, warty rind, some by a rind cracked in a net-like manner, some by ribs and furrows, and some by a perfectly smooth and thin rind. The flesh may be white, red, green, yellow, or of intermediate colors. There are also varieties that ripen early and late, and one group of varieties little grown in the United States, which keep well into the winter. They require a warm, quick soil. In field culture they are planted—6 to 10 seeds—in hills 4 to 6 feet apart either way. To hasten growth and on poor soils two or three shovelfuls of well-rotted manure are placed under each hill. In the North, commercial growers start the plants under glass, preferably in a hot bed, and transplant them to the open field when the weather becomes warm enough. The seedlings are transplanted with difficulty and are therefore usually grown on inverted 'sods or in pots. Some subspecies of *Cucumis Melo* are: Var. *saccharinus* or pineapple melon, a sweet-fleshed variety; var. *flexuosus* or snake melon, 2 to 3 feet long and 1 to 3 inches in diameter, sometimes grown for preserves, but more often as an oddity; var. *chito*, also called orange melon, vegetable orange, garden lemon, vine peach, etc., and used for pickles and preserves; var. *inodorus*, a long keeper of poor quality; var. *Dudaim*, or pomegranate, dudaim, or Queen Anne's pocket melon, a highly perfumed, but inedible sort. See PLATE OF CUCUMBER ALLIES.

The striped beetle and flea beetle are serious pests of muskmelons. Spraying with Paris green or dusting with tobacco dust, air-slaked lime, or road dust when the plants are moist, helps to keep the insects under control. Land plaster mixed with kerosene or turpentine is used for the same purpose. The downy mildew and leaf spot diseases which attack the plant are held in check by applications of Bordeaux mixture. Muskmelons are commonly called cantaloupes in the United States. See FUNGICIDE.

MUSKOKA, müs-kō'kā. A lake region of Ontario, Canada, bounded on the north and northeast by Lake Nipissing and the Ottawa River, on the south by Lake Simcoe, and on the west by Georgian Bay (Map: Ontario, D 3). The region covers an area of about 10,000 square miles, 800 feet above the sea and 200 feet above Lake Huron. Besides a lake, river, and county of the same name, it includes extensive forests, several rivers, and from 800 to 1000 lakes and smaller sheets of water. Fine waterfalls also occur, of which the most important are the Bridal Veil Falls on the Shadow River, and the High

Falls and the South Falls with a descent of 130 feet, on the Muskoka, near Bracebridge (population, in 1891, 1419; in 1901, 2479), the county capital. The chief lakes, Muskoka, 20 miles long by 2 to 8 miles broad, Rosseau, 12 miles long and 1 to 6 miles wide, and Joseph, are connected and have regular steamer navigation service in summer, in connection with the Grand Trunk, the Canadian Atlantic, and the Canadian Pacific railways, which traverse the region. The forests abound in game, and the lakes with fish, and the district has become popular for its hunting, angling, boating, and bathing.

MUSK OX. The musk ox (*Ovibos moschatus*), although approaching cattle in size, is really quite as closely allied to the sheep. It undoubtedly belongs in the family Bovidae and is perhaps entitled to have a subfamily division to itself. The genus contains only the single species, at present confined to Arctic America, but formerly ranging over the Northern United States as far south as Kentucky and over Northern Asia and Europe also, as is shown by the bones found in the Pleistocene deposits of those regions. Its southern limit is gradually retreating northward, and there can be little doubt that the number of musk oxen is steadily declining. The name 'musk ox' or 'musk sheep' refers to a peculiar musky odor, the origin of which seems to be in doubt; apparently, however, there is no special gland as in the musk deer and other musky mammals. The legs are short and stout, so that the animal is somewhat lower than a small ox, which it otherwise resembles in size and shape. The hair is amber brown, woolly and long; thick, matted and curly on the shoulders, giving the appearance there of a hump; elsewhere it is straight and hangs down so as to conceal the short tail and upper half of the legs. The wool has been spun into fabrics said to be extremely soft. The hoofs are remarkable in being asymmetrical, the outer half being rounded while the inner is pointed; the sole of the foot is hairy. The head is inclined to be massive, especially in old males, where the horns have extremely broad bases. The latter are elegantly curved, first obliquely downward and backward by the side of the head and then upward and forward. The ears are so small as to be concealed by the hair, and the muffle is hairy as in sheep and goats. The flesh is coarse grained, but of variable quality, some individuals being tender and of good flavor, while others are tough and so musky as to be uneatable. Curiously enough, the difference in flavor is apparently not a matter of age or sex. Musk oxen are gregarious, going in flocks of 20 or 30, or rarely as many as 80 or 100, and are said to be very sheep-like in their habits. Although the legs are so short, they run with speed, and can climb steep slopes and clamber over rocks with remarkable agility. The young are produced, one at a time, at the end of May or early in June, and the rutting season is in September. The food of the musk ox is grass, moss, lichens, and tender shoots of willow and pine. They are themselves an important item in the larder of the Eskimos and of Arctic explorers. The writings of these explorers contain the best accounts of the animal, whose young have now and then been brought alive to Europe, and have survived for a time in zoölogical gardens. See Plate of WILD SHEEP AND MUSK OX with SHEEP.

MUSK PLANT, MUSK ROOT, MUSK TREE, MUSK WOOD. Various plants possessed of a musky odor. Among these are the common musk plant (*Mimulus moschatus*); the musk tree (*Olearia argophylla*) of Tasmania; the musk okra (*Hibiscus moscheutos*); the musk tree of Jamaica (*Trichilia moschata*); and the West Indian musk wood (*Guarea grandifolia*), used in perfumery. The drug called musk root or Sumbul, brought from Asia principally through Russia and Persia, is the starchy root of *Euryan-gium Sumbul*, which has a pure musky odor, and is used as a substitute for musk.

MUSKRAT (so called from its musky odor), or MUSQUASH. The muskrat (*Fiber zibethicus*) is one of the most widely distributed and best known of North American quadrupeds, and it is peculiar to this continent. It makes its home in the banks or water of streams, ponds, and lakes. It is the largest known species of the subfamily Arvicolinae (see VOLE) of the family Muridae, and is peculiarly adapted to an aquatic life, although there are other species of the subfamily which are also amphibious. Its body is about 12 inches in length, and its tail about 8 inches. The body is rather stout and thickset, the head is rounded, and the ears are small and close. The front feet are rather small, with four digits and a rudimentary thumb, while the hind feet are stout, with five partially webbed toes, and so attached to the leg that they are well fitted for swimming, yet the sculling movement of the much compressed tail is the principal means of progress in the water. As with other aquatic mammals, the pelage consists of an undercoat of dense, soft fur and an outer coat, on the back and sides, chiefly of long, shining, smooth hairs. So much air is held by these outer hairs that in ordinary excursions the under fur is hardly wetted. The color above is dark amber brown, darkest on the middle of the back and on the tail, while beneath the prevailing shade is gray.

The musky odor from which the animal gets its name is due to the secretion of a large gland in the inguinal region, which is present in both sexes. The muskrat is omnivorous, eating roots (especially of the pond lily), fruits, vegetables, insects, worms, mollusks, etc., but it is especially fond of apples, in search of which it often wanders far from its home, and thus finds its way occasionally into barns and cellars. In some localities fresh-water mussels are a favorite article of food, and large heaps of the empty shells are sometimes found near muskrat burrows, due to their preference for dining day after day in the same place. Although so widely distributed and abundant, the muskrat is not often seen, as it is mainly nocturnal in its habits, and during the day remains in its burrow or house. The home of this animal is either built of sticks, mud, and grass, and forms a heap the size and appearance of a small haystack, or else is dug out of the bank of a stream or pond and then forms a burrow of indefinite length, the entrance to which is under water. The character of the home seems to depend upon the nature of the country; where there is an extensive swamp, or stretch of shallow water, so that the houses will not be ordinarily exposed to wandering enemies, muskrats seem to prefer these homes; but where they live in or about a narrow stream,

with little swamp, the burrow in the bank is the more usual shelter. The houses are always entered from water deep enough so that the passageway shall not freeze up in winter.

The flesh of the muskrat is good eating, and was formerly much used by the Indians. The fur is used quite extensively, so that the skins are an article of commerce. For this reason, muskrats are extensively trapped and hundreds of thousands are killed annually. Their numbers nevertheless do not decrease, partly because their natural enemies are fewer, but chiefly because of the fact that the making of slackwater spaces by damming rivers, and the digging of canals (whose banks they seriously damage), have greatly extended waters suitable for them in various parts of the country. Trapping is done, chiefly in the winter, by setting small steel traps at the entrance to their houses or burrows or in runways where they come ashore.

The name muskrat is applied to a number of other more or less rat-like animals, on account of their strong odor. In Europe it is frequently given to the desman (q.v.), while in India it is associated with a shrew (*Crocidura cærulea*) which has well-developed musk glands on the belly and flanks. In South Africa the genet (*Genetta felina*), a viverrine, carnivorous mammal, is sometimes so called.

Consult the works of Audubon, Richardson, Godman, Kennicott, and other early writers; and of C. C. Abbott, H. D. Thoreau, J. Burroughs, D. L. Sharp, R. Robinson, A. L. Adams, W. Cram, J. A. Allen, E. S. Mearns, and other recent naturalists; especially Merriam, *Mammals of the Adirondacks* (New York, 1895); Herrick, *Mammals of Minnesota* (Minneapolis, 1892); Butler, "Observations on the Muskrat," in *American Naturalist*, vol. xv. (Philadelphia, 1885); Cram and Stone, *American Animals* (New York, 1902).

See Plate of BEAVER, COYPU, AND MUSKRAT.

MUSK SHEEP. A musk ox (q.v.).

MUSK SHREW. One of a large group of Old World shrews, of which about eighty species of the genus *Crocidura* are known. They are noted for their musky odor, range from the Mediterranean to Northern India, and are of terrestrial habits. One of these shrews (*Crocidura cærulea*) is the largest of its race (see SHREW), and as large as a rat. It is gray, and is known to Anglo-Indians as the 'muskrat.' It enters houses and at night runs about, catching insect vermin; but counterbalances this beneficial service by leaving behind a musky odor, sometimes unpleasantly strong.

MUSK TORTOISE, MUSK TURTLE, or STINKPOT. One of the mud or 'box' turtles (*Cinosternum odoratum*) of the eastern half of the United States, well known for its strong, musky odor, which exudes from glands in the arm-pits. It has a disproportionately large head, a long and slender neck, with two yellow stripes on each side, and a dusky shell, clouded and sometimes spotted. It is edible.

MUSKWAKI, mûsk-wâ'kê. An Algonquian tribe. See FOX.

MUSLIN (Fr. *mousseline*, from It. *mussolino*, muslin, made of muslin, from *mussolo*, muslin, from ML. *Mossula*, from Syr. *Mosul*, a city of Mesopotamia on the Tigris, whence the fabric originally came). A cotton fabric of Oriental

origin. No such trade now exists in the Orient; and for muslins of the common kinds at least the Indian market depends upon the manufactures of England and France. Muslin is much less compact in its texture than calico—indeed, it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the filling threads with those of the warp. The manufacture of muslins is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. The term muslin is also applied to a coarser and heavier, but plainly woven cotton cloth, suitable for sheets and pillow-cases. See WEAVING.

MUSPRATT, JAMES SHERIDAN (1821-71). An eminent Irish chemist. He studied under Liebig, at Giessen, 1843-45, and there took the degree of Doctor of Philosophy, with a thesis tracing the resemblance between the carbonates and sulphites. In 1847 he produced a number of interesting organic substances from the sulphocyanates of ethyl and methyl. On his return to England in 1848 he established and became superintendent of a college of chemistry at Liverpool. From 1854 to 1860 he was engaged on his well-known dictionary of chemistry. The latest German edition of this important work may be found mentioned in the bibliographic section of the article CHEMISTRY. His *Outlines of Quantitative Analysis for Students* has had a considerable circulation.

MUSQUASH. The name among the Indians of the Canadian Northwest for the muskrat (q.v.). "Talking musquash" is a phrase in the Hudson Bay region for the gossip of trappers or fur traders about peltries, of which the fur of the muskrat forms a constant and important item.

MUSSAFIA, mûs-sâ'fê-â, ADOLF (1835—). An Austrian Romance philologist, born at Spalato. He studied medicine, but in 1855 became instructor of Italian at the University of Vienna, and in 1860 professor of Romance philology. He contributed valuable papers on Italian dialects to the proceedings of the Vienna Academy, and wrote: *Altfranzösische Gedichte aus venezianischen Handschriften* (1864); an edition of Fra Paolino's *De Regimine Rectoris* (1868); *Handschriftliche Studien* (1862-70); *Ueber die spanische Version der Historia Troiana* (1871); *Die catalanische Version der sieben weisen Meister* (1876); and studies of the legends of the Madonna (1884-91).

MUSSEL (AS. *muxle*, *mucæle*, from Lat. *musculus*, small fish, sea-mussel, diminutive of *mus*, mouse). The word mussel is one of those popular names of such uncertain limits that to attempt to define it is a difficult matter. At the present time it is applied to two totally distinct groups of bivalved mollusks, one marine and the other fresh-water. The first group includes the shell-fish of the family Mytilide, especially the genera *Mytilus*, *Modiola*, and *Modiolaria*. This family is characterized by the presence of a well-developed byssus, two adductor muscles, a fringed vestige of a siphon, and an equivalve but inequilateral shell, with a thick epidermis, but with a weak and usually toothless hinge. The 'common' mussel (*Mytilus edulis*) of all northern coasts is in the Old World much raised for food, but its greatest importance in the United States lies in its usefulness as bait for fishermen and as manure for farmers near the coast.

It is gregarious and occurs in masses, closely crowded together, adhering to rocks, sand, and each other, by the very tough byssus, the whole 'beds' being thus practically spun together. These beds are generally in shallow water, less than thirty fathoms, and are often exposed at low tide. The shell is oblong with a terminal umbone, and generally about three inches long by an inch and a half wide; but under favorable conditions they may become six inches or even more in length. The outside of the shell is black, but inside it is pearly blue. When young, mus-

AMERICAN MARINE MUSSELS.

a, common edible mussel (*Mytilus edulis*); b, horse or meadow mussel (*Modiola modiolus*); c, ribbed mussel (*Modiola plicatula*).

sels move about, but they soon anchor themselves by the byssus, and unless artificially disturbed will remain fixed throughout life. So strong are the byssus-threads that these mollusks have been utilized as an aid in the strengthening of breakwaters, the young mussels being planted on the rocks in myriads and thus assisting in uniting the separate pieces into a rigid whole. The horse-mussels (q.v.) belong to the genus *Modiola*, which does not have the umbone terminal. They are more elongated than *Mytilus* and some species reach a much larger size. See Colored Plate of CLAMS and EDIBLE MUSSELS.

The other group to which the name mussel is given is the family Unionidae, which are fresh-water mollusks of very wide distribution. The family is characterized by the possession of two adductor muscles and regular shells, with thick epidermis and thin nacreous layer, prominent external ligament, and a variable hinge. Upward of a thousand species have been named, a very large proportion of which occur in the United States, where the family is very abundant and widely distributed. It is still an open question as to what constitutes a valid species or even a genus in this family, though several genera, as *Unio*, *Anodon*, and *Margaritana*, are recognized. These fresh-water mussels occur in lakes, ponds, and streams, generally in large numbers together, and are sometimes eight inches or more in length, by four in breadth, but they are usually smaller and narrower. They are sometimes used for food, but are tough and not very palatable. Their chief importance lies in the fact that they frequently produce pearls, and are indeed the only basis of the fresh-water pearl industry. As high as \$25,000 has been paid for a single mussel-pearl. (See PEARL.) All of the Unionidae have a remarkable life-history, for the eggs when laid find their way into the mother's gills, where they remain until the young are hatched. Although these young have a bivalve shell, they are totally different from the adults and have a very simple structure. At this stage

of development they are called 'glochidia' larvæ. After leaving the maternal gills they attach themselves to the skin of a fish, where they give rise to an excrescence which gradually swells until it is a capsule big enough to see with the naked eye. These capsules are almost black and are usually seen on or near the fins of the host fish; they are often very numerous on a single fish. Within the capsule the glochidium lives until it finally assumes the adult form, when it breaks through the outer wall of the capsule and settles to the bottom as a miniature mussel. The distribution of the species is therefore mainly dependent on the activity of the fishes which serve as hosts.

Fossil mussels are found in most geological formations from those of Ordovician age to those of recent time. They comprise the superfamily Mytilacea, containing the families Modiolopsidæ, Mytilidæ, and Dreissensiidæ. The first, now entirely extinct, are essentially ancestral forms of the Mytilidæ, which range through Devonian to recent formations. The Paleozoic species of this family belong mostly to the genus *Modiola*, which began in Devonian, was abundant in Jurassic and Tertiary time, and still persists as a common shell of the littoral zone of all seas. *Mytilus* began in the Triassic. *Lithophagus* or *Lithodomus*, the mussel which bores cavities in limestone rock, has been recognized in Mesozoic and Tertiary formations. The Dreissensiidæ are of later origin, appearing first in the Tertiary. They are essentially fresh-water and estuarine mussels, and have probably evolved from *Mytilus* or a closely allied genus of the littoral zone in late Mesozoic or early Tertiary time. See Plate of ABALONE, ETC., and illustration under MOLLUSK.

MUSSELBURGH, mûs'sel-bûr-ô. A small seaport town and Parliamentary burgh in the county of Edinburgh, Scotland, at the mouth of the Esk, 3½ miles north by east of Dalkeith (Map: Scotland, F 4). Tanning, leather-dressing, and the manufacture of sail-cloths, nets, and salt are carried on. The harbor at Fisherrow is frequented by coasting craft, and by small vessels from Holland and the Baltic. There are famous golf-links here. In the vicinity are interesting antiquities. Population, in 1891, 8888; in 1901, 11,704.

MUSSEL-DIGGER. A popular name for the California gray whale.

MUSSEL SCALE. A diaspine scale insect of the genus *Mytilaspis*, all of the species of which bear scales shaped like a mussel shell or the shell of an oyster. Several species are very injurious to vegetation. The so-called 'oyster-shell bark-louse' of the apple (*Mytilaspis pomorum*) is a cosmopolitan enemy of apples and pears; and the long scale and the purple scale of the orange are pernicious examples.

MUSSET, mu'sâ', ALFRED DE (1810-57). A noted French poet, dramatist, and novelist, born in Paris, November 11, 1810. His father was a man of letters, and Alfred grew up in a literary atmosphere, was graduated with honors at the Collège Henri Quatre, and published at twenty his first verses, *Contes d'Espagne et d'Italie* (1830). This, with *Poésies diverses* (1831), and *Le spectacle dans un fauteuil* (1832), established his fame. The latter contained a

poem, *Namouna*, and two short plays in a manner peculiarly his own, *La coupe et les lèvres* and *A quoi rêvent les jeunes filles*. He had already produced on the stage a comedy, *La nuit vénitienne* (1830), a failure. In 1833 he followed the dramatic vein in two tragi-comedies, *André del Sarto* and *Les caprices de Marianne*, possibly his best. *Rolla*, too, belongs to this year, and was once thought the French *Childe Harold*, though now less admired. This sudden flowering of Musset's genius was interrupted by a reckless passion for George Sand (q.v.), whom he first met in the summer of 1833, and accompanied in 1834 to Italy as her 'secretary.' He suffered acutely in this new relation from disillusionment and self-deception. He "was a child all his life and a spoiled child," never more so than in the inevitable estrangement (1835) that cost George Sand few pangs, but marks a cardinal point in Musset's career. He returned sick, experienced another unhappy love and a series of sordid entanglements, and worked intensely and admirably, at intervals interspersed with periods of depression. Through the patronage of the Duc d'Orléans he received a position as librarian in 1838.

Musset's work after the separation from George Sand (*Les nuits*, *Ode à la Malibran*, *Lettre à Lamartine*, *Espoir en Dieu*) shows at its best a sad, yet in the main sober, resignation. But during this period he was more occupied with drama and with prose fiction. Of the *Comédies et proverbes*, *Fantasio* and *On ne badine pas avec l'amour* belong to 1834, *Le chandelier* to 1835, *Il ne faut jurer de rien* to 1836. *Lorenzaccio*, an historical drama (1834), had no success. These, as Lemaitre points out in his preface to Jouaust's *Théâtre d'Alfred de Musset*, show the most genuine and original dramatic talent of all the Romantic School. Tragedy mingles here with comedy, not as with Hugo by juxtaposition, but by interpenetration, for Musset had too true a taste to yield to the extravagances of Dumas or Hugo. In an essay *La tragédie* (1838) he refuses allegiance alike to French romantic or classic principles, but he combines the outward appearance of restraint with the new liberty to associate the weird and terrible in human life with its higher comic aspects. Thus he succeeded in presenting complex characters better than any of his contemporaries or predecessors in French drama. His wit in dialogue had not been equaled since Beaumarchais. None of these plays was acted in France before 1848, and their influence is hardly noticeable before 1865, but they contain the quintessence of romantic imaginative art. They show most and best the unchecked freedom of fancy that joined with the spirit of realistic comedy in Ponsard, Dumas, and Augier to produce the modern French drama. Musset's prose fiction begins with *Les confessions d'un enfant du siècle* (1836), which in spirit at least is autobiographic. This was followed by nine *Contes* (1837-44), of which *Croisilles* is best, and a tenth, *La mouche* (1851), one of the last flickerings of his genius. These are interesting chiefly in exhibiting the progress of ethical disintegration. *Margot* and *Le merle blanc* have autobiographic elements. So perhaps has *Mimi Pinson*, a 'profil de grisette' (1845). In this story Musset anticipates by some six years a type of the French working girl portrayed by Henri Murger. *Mimi* has few clothes, but she looks as tidy as she can, and has the pretty manners, the

recklessness as to the future, and the easy morality of the *grisette*. Musset's critical essays are also worthy of remark, especially the witty *Lettres de Dupuis et Cotonet*, satirizing modern marriage, journalists, novelists, and, above all, the critics of thoroughbred Romanticism. Musset's closing years were marked by dejection and by comparative inactivity. In 1841 he flung at the Germans his fiery war song, *Le Rhin allemand*. In 1845 appeared *Il faut qu'une porte soit ouverte ou fermée*, a proverb. In 1847 *Un caprice* (1837), a little tragedy with a chorus to utter platitudes in Greek style, was performed at the Théâtre Français. Between 1848 and 1851 *Bettine* was played, and *Carmosine* was written, but they are scarcely worthy of their author.

Musset died of an affection of the heart, May 2, 1857. His works were published in ten volumes in 1865.

Consult: Sainte-Beuve, *Portraits contemporains*, vol. ii., and also his *Causeries du lundi*, vols. i., xiii.; George Sand, *Elle et lui* (Paris, 1859); Paul de Musset, *Lui et elle* (ib., 1860); id., *Biographie d'Alfred de Musset* (ib., 1877); Jaubert, *Souvenirs* (ib., 1881); Faguet, *Etudes littéraires sur le XIX^{ème} siècle* (ib., 1887); Lemaitre, *Introduction au théâtre de Musset* (ib., 1885-89); Palgrave, *Oxford Essays* (Oxford, 1855); Lindau, *Alfred de Musset* (Berlin, 1877); Spoelbergh de Lovenjoul, *Etude critique et bibliographique sur les œuvres d'Alfred de Musset* (Paris, 1867); Barine, *Alfred de Musset* (ib., 1893).

MUSSEY, REUBEN DIMOND (1780-1866). An American surgeon, born at Pelham, N. H. He graduated at Dartmouth in 1803, and received the degree of M.D. from the University of Pennsylvania in 1809. He held medical professorships at Dartmouth, Cincinnati, and Miami Medical College, and gained a high reputation as a bold and skillful operator. He was the first to tie both carotid arteries, and the first to remove completely the shoulder blade (1837); and was unusually successful in lithotomy and operations for strangulated hernia. He wrote *Health: Its Friends and Its Foes* (1862).

MUS'SULMAN. See MOSLEM.

MUSTAGH (moo-stăg') **MOUNTAINS.** A mountain range in Kashmir. See KARAKORUM MOUNTAINS.

MUSTAPHA, mōō'stā-fī. The name of four Ottoman sultans. The first (1591-1639), a son of Mohammed III., succeeded Achmet I. in 1617. was deposed after three months, came to the throne again in 1622, and was again deposed (1623). He was feeble-minded.—**MUSTAPHA II.** (1664-1704) came to the throne in 1695, and at the Peace of Carlowitz signed away the Morea, the Ukraine, Hungary between the Danube and Theiss, and Azov. He was deposed by a rising of the Janizaries in 1703.—**MUSTAPHA III.** (1717-74) ruled from 1757 until his death. He quarreled with Russia and Poland and involved the country in war which lasted through his reign. His internal reforms were no more successful than his foreign policy.—**MUSTAPHA IV.** (1779-1808) was made Sultan by the Janizaries, who rebelled against Selim III. in 1807, and was deposed and killed in the next year.

MUSTAPHA, KARA, kă'râ. A Turkish grand vizier. See KARA MUSTAPHA.

MUSTARD (OF. *moustarde*, Fr. *moutarde*, from OF. *moust*, from Lat. *mustum*, must, neu. of *mustus*, fresh), *Brassica*. A genus of plants of the natural order Cruciferae, having yellow flowers, and linear or oblong pods, which terminate in a sword-shaped, compressed, or four-cornered beak, and contain one row of seeds. The black mustard (*Brassica nigra*) is an annual, which grows wild in fields and by waysides in the middle and south of Europe. Its pods are bluntly four-angled, smooth, erect, and lie close to the stem, their valves one-nerved; the leaves are smooth, the lower ones lyrate, the upper linear-lanceolate; the seeds are brownish black. White mustard (*Brassica alba*), also a native of most parts of Europe, is an annual having divergent pods covered with stiff hairs, the valves five-nerved, the seeds yellowish, the leaves pinnatifid. Both these species are cultivated in Europe and to a limited extent in America, for their seeds, which are ground into powder to make the well-known condiment called mustard. The mustard of commerce is frequently mixed with flour and commonly colored with turmeric. The powder of the seeds is also much used in medicine as a rubefacient. Mustard seeds depend for their pungency on a principle which, when water is added to black mustard, forms volatile oil of mustard. There is also in the seeds a bland fixed oil, oil of mustard, which is obtained from them by expression, and constitutes about 28 per cent. of their weight. White mustard is often sown in gardens and forced in hot-houses for use as a salad. It is also sometimes sown as a green manure crop and for feeding sheep, when turnip or rape has failed. Wild mustard, or charlock (*Brassica arvensis*, or *Sinapisitrum* of some botanists), which is distinguished by turgid and knotty pods with many angles and longer than the two-edged beak, is a troublesome annual weed in both Europe and America. It is controlled by spraying with a 2 per cent. solution of copper sulphate or 12 to 15 per cent. iron sulphate at the rate of 50 to 70 gallons per acre. (See HERBICIDE.) Indian mustard (*Brassica ramosa*) is extensively cultivated in India for its seeds, which are used as a condiment, as are those of *Brassica dichotoma* and *Brassica glauca* (regarded by some botanists as forms of *Brassica arvensis*), also cultivated in India. Other species are *Brassica japonica*, used to a considerable extent in the United States for greens; a turnip-rooted Chinese form (*Brassica napiformis*), and Chinese mustard (*Brassica juncea*). See illustration of CABBAGE AND ALLIES.

MUSTARD FAMILY. A natural order of plants. See CRUCIFERÆ.

MUSTARD OIL, or OIL OF MUSTARD, chemically known as *allyl iso-sulphocyanate*, C_3H_5NCS . A volatile oil obtained from black mustard, the seeds of the *Brassica nigra*, growing in Asia and in Southern Europe. The seeds contain a bland fixed oil which may be removed by expression, but they do not contain the volatile oil ready-formed. The latter is produced by the action of a soluble ferment (myrosin) upon the potassium salt of myronic acid (a glucoside), in the presence of water. Both myrosin and potassium myronate are contained in black mustard seeds. If, therefore, after the fixed oil has been removed, the crushed seeds are treated with water and distilled, the volatile oil is obtained, in much the same way as the volatile oil of

almonds is obtained from bitter almonds. (See ALMONDS, VOLATILE OIL OF.) Mustard oil is a very volatile colorless liquid, having a painfully pungent odor and an acrid taste; when applied to the skin it speedily raises blisters; it is insoluble in water, and, if pure, boils at $151^{\circ}C$. Its formation from potassium myronate takes place according to the following chemical equation:

The pungency of ordinary mustard as a condiment is due to the formation of the volatile oil on addition of water. The allyl iso-sulphocyanate prepared by an artificial process in the chemical laboratory, is identical with the volatile oil obtained from mustard seeds.

The term *mustard oils* is often applied to organic iso-sulphocyanates in general.

MUSTELIDÆ (Neo-Lat. nom. pl., from Lat. *mustela*, weasel, from *mus*, mouse). The family of small carnivores, represented by the weasel, and embracing the more highly valued fur-bearing animals. They are related to the arctoid Carnivora, especially the bears, and the family includes three groups, as follows: (1) *Melinae* (the Old World badgers); (2) *Mustelinae* (grison, marten, sable, wolverine, polecat, weasels, ratel, American badger, and skunks); (3) *Lutrinae* (otters). Consult authorities cited under MAMMALIA, especially Beddard. See FUR-BEARING ANIMALS.

MUSTER (from OF. *mostre*, *monstre*, Fr. *montre*, show, from Lat. *monstrare*, to show, from *monstrum*, portent, monster, from *monere*, to warn). When used in its military sense, this term applies particularly to the assembling of troops for the verification of membership. In the United States the troops are mustered for pay on the last day of each month, each stated muster being preceded by a minute inspection. In the British Army there is a special muster parade once each year, when every individual of each command must respond in person to the regimental muster roll. In the navy the crews are frequently assembled or mustered for the purpose of ascertaining if all are on board or for drill or instruction or reading general orders. Once a month (on the first Sunday occurring in the month) the officers and crew of the vessels of the United States Navy are called to 'general muster.' The presence of the officers is ascertained by inspection; but the names of the crew are called by the paymaster or his clerk, and each man in turn, except petty officers, as his name is reached, passes across the deck, before the captain. It was formerly the custom to muster the crew aft and read the *Articles for the Better Government of the Navy*, and then call the muster roll of the crew. The two performances now take place on different Sundays.

MÛT, mōt. An Egyptian goddess, the wife of Ammon (q.v.) of Thebes, and the mother of Chons (q.v.). Her name signifies 'mother,' and in the inscriptions she is entitled 'the lady of heaven, the queen of the earth.' The chief temple of the goddess was at Karnak; it was connected with the great Temple of Ammon by a long avenue of sphinxes, and was partly surrounded by the sacred lake Asher. From the latter circumstance Mût is often called 'the lady of Asher.' She is frequently represented as a lion-headed goddess wearing upon her head the solar disk, but in

mural decorations she is more commonly depicted in human form wearing the vulture head-dress and other symbols of a queen of Egypt. Consult: Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Benson and Gourlay, *The Temple of Mât in Asher* (London, 1898).

MUTANABBI, mō'tā-nā'bē (Ar. *Abu al-Tayyib Ahmad ibn al-Husain al-Mutanabbi* (905-965)). One of the most noted of the Arabic poets of the period of decline. He was born in Syria, the son of a water-carrier, and spent several years in the desert *al-Samū'a* (Mesopotamia). He was not a fervid Moslem, and at one time even put himself forward as a prophet (whence his name, *Mutanabbi*, 'the one claiming to be a prophet'). He was taken prisoner by Lulu, the Ikhshid Emir of Emesa. After being set at liberty he lived in great poverty and neglect, but in 948 became attached to the Court of Saif al-Dawlah at Aleppo, whom he accompanied on his raids, and whose praises he sang. He left Saif al-Dawlah in 957, going over to his enemy the Ikhshid Kafur of Egypt. In 961 he went to Bagdad, and at last to Shiraz, where the Bujide Adud al-Dawlah became his patron. He was murdered in 965 on the road from Shiraz to Kufa. His *Diwān*, containing 289 poems, has been very widely read in the East, where he is considered the last great Arabic poet, perhaps because of his intense national feeling. No less than forty commentaries have been written on his *Diwān*. *Mutanabbi* is the type of the Court singer, his theme the battle and the heroic deeds of his patrons. His songs lack the fire of the earlier Bedouin poetry and are artificial, but their technical excellence cannot be denied. They have been edited by Dieterici, with the commentary of *al-Wahidi* (Berlin, 1861), and published at Bulak (1860) and Cairo (1870 and 1890) with that of *al-Ukbari*. Other editions are: Calcutta (1815), Beirut (1860), Bombay (1892). The *Diwān* has been completely translated by Hammer-Purgstall, *Motenebbi der grösste arabische Dichter* (Vienna, 1824); extracts may be found in Rückert's *Hamasa* (Stuttgart, 1846), and in Ouseley, *The Oriental Collection*, vol. i. (London, 1797). Consult: Bohlen, *Commentatio de Mutanabbio*, (Bonn, 1824); Dieterici, *Mutanabbi und Seifdaula* (Leipzig, 1847).

MUTATION. See UMLAUT.

MUTATION THEORY (Lat. *mutatio*, change, from *mutare*, to change, for *movitare*, frequentative of *morere*, to move, Skt. *mir*, to push). The hypothesis that evolution (q.v.) takes place by means of sudden changes rather than through slow and almost imperceptible transformations. This idea, though not new, has been called into great prominence by the publication in 1901 of *Die Mutationstheorie* by Prof. Hugo de Vries, professor of botany at Amsterdam. Darwin himself, especially in his earlier works, recognized that 'single variations' or sports are to be reckoned with as well as natural selection. Through the influence of Wallace and others, natural selection had come to be the ruling theory, and it is only in recent years that the significance of sports in evolution has had much place. However, as long ago as 1864 Kölliker made an appeal for heterogenesis (which is identical with the mutation of De Vries) as a factor in the evolution of species. Professor Scott of Princeton has used the word mutation

for gradual modifications. Still other writers have referred to the sudden origin of species as saltatory evolution. But De Vries is the first author who has performed experiments and worked out a theory to fit the facts which they have yielded.

Before taking up the experiments it may be said that mutation involves no necessary abandonment of natural selection, except in so far as it may have been held to account for the actual origination of new characters. Darwin recognized that natural selection improves but cannot originate anything new; mutation, on the other hand, is a means for the development of new characters, and even a new assemblage of characters, i.e. a new species. It should be stated, however, that De Vries gives but little place to natural selection, even as a means of improving something already present. His experiments show that there is a definite and rather narrow limit to individual variation, and the full advantage of artificial selection along any given line can usually be obtained within a few generations, as in the parsnip or carrot. He claims also that natural selection never fixes a character, but that reversion to the original may occur after many generations. Mutation, on the other hand, is believed to bring into existence something wholly new, without any transitions or connecting links. The new form, i.e. the mutant, remains fixed from the outset, and if it is fit, it will remain as a new species.

In 1886 De Vries observed a colony of evening primrose (*Oenothera Lamarckiana*) in which were two forms differing strikingly from the common type. Feeling that these aberrant forms doubtless came from the same parentage as the more common forms, he made artificial cultures to see if further aberrant forms would develop. He found such to be the case to an astonishing degree. Out of 50,000 seedlings of *Oenothera Lamarckiana* in the various years of study, 800, or about 1.5 per cent., were mutants, while 98.5 per cent. came true to seed. More than one-fourth of the 800 mutants were of one type, which De Vries named *Oenothera lutea*, i.e. this form appeared anew in cultures more than 200 times. A form which he called *Oenothera gigas* appeared but once. When cultures are made from these new forms they are found to come true to seed except for occasional mutations; nor was any tendency to reversion observed. To these new forms, as to the two aberrant types observed in 1886, De Vries has given names which imply that these forms are actually new species. They have, he says, all the characteristics of species, differing not in one, but in several characters, and remaining constant in all cultures. He shows that they are as much entitled to be considered separate species as are the various members of the natural group to which the parent *Oenothera Lamarckiana* belongs. Indeed, it is possible to identify most of the new species even while yet seedlings. There are no transitions between parent and offspring, or between one new species and another. There is no slow and gradual fixation of characters by natural selection, but the new species is complete from the outset. Most of these new forms would doubtless disappear in a natural state, for they would be obliged to engage in a keen struggle with species already present, or would gradually suffer the loss of their specific characters through hybridization. How-

ever, some new species, especially if stronger than the parent form, might survive and extend their area; the two aberrant types first observed in a field in 1886 are still to be seen there and in greater numbers. Thus it may be said that De Vries has seen the birth of new species, a phenomenon which all evolutionists have wished to see.

It is of interest to observe that independently and almost simultaneously with De Vries, Korschinsky has brought together a vast mass of data under the title "Heterogenesis and Evolution." From the records of gardeners and horticulturists he has concluded that most cultivated 'varieties' of plants have arisen suddenly as sports, i.e. through heterogenesis or mutation.

(1901); *Bulletin of Torrey Botanical Club* (August, 1902); Moll, *Biologisches Centralblatt* (1901-02); De Vries, *Revue Générale Botanique*, vol. xiii. (1901); *Science*, vol. xv. (1902).

MUTAZILITES (Ar. *Mu'tazilah*, from 'azala, to separate). A Mohammedan sect founded by Wasil ibn Ata (c.745) and his disciple Abu al-Hudhail al-Allaf (died c.845). They had rationalistic tendencies, illustrated, e.g. by the teaching of Abu al-Hudhail, that man knows right and wrong by reason, independent of supernatural revelation. Later teachers developed several subdivisions of the sect. See **MOHAMMEDAN SECTS**.

MUTE (from Lat. *mutus*, dumb; connected with Skt. *mūka*, dumb). A small instrument used to modify the sound of any of the string instruments. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interjected between every two strings. The use of the mute both softens the tone and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. It is much used in dramatic music to give color in dream-like or mystic situations. Its application is indicated by the letters *c. s.*, or *con sordini*, and its discontinuance by *s. s.*, or *senza sordini*. Mutes for brass instruments are wooden cones with a hole bored through them so as to allow the passage of the air. They are inserted into the bell of the instrument. But, as their insertion affects the pitch of the instrument, these mutes must be used with the utmost care. Recently attempts have been made to construct complicated mutes for brass instruments that shall not affect the pitch. In the case of horns and trumpets the left hand is used as a mute. Mutes are also used for drums. On snare-drums a piece of cloth or felt is inserted on the lower side between the membrane and the snares. Kettle-drums are covered with a cloth or the membrane is lightly touched with the left hand. On the piano the soft pedal is frequently called mute.

MUTES. A term applied in phonetics (q.v.) to articulate sounds, also called occlusives, produced by a momentary closure, followed by a reopening of some portion of the oral passage. The mutes are either voiced (sonant, breathed) if the breath-stream makes the glottal chords vibrate, or unvoiced (surd, unbreathed) if the glottal chords are at rest, as *b, p; d, t; jh, ch*. With respect to the point of occlusion mutes are classified as gutturals, *k, kh, g, gh*; palatals,

c, ch, j, jh; cerebrals (linguals, cacuminals), *t, th, d, dh*; dentals, *t, th, d, dh*; and labials, *p, ph, b, bh*. The essential physiological condition for the mutes lies not in the closure, but in the reopening of the oral passage, while their quality is determined by the presence or absence of breath, and by the point of the occlusion.

MUTIANUS, CONRADUS RUFUS (1471-1526). A German humanist, whose name in the vernacular was Konrad Mut. He was born at Homberg; studied under Hegius at Deventer, then at Erfurt, and for six or seven years in Italy. Thence he brought to Germany the idea of a humanistic association or academy, and by his letters from Gotha became the centre of the *Mutianische Bund*, which included Justus Jonas and Camerarius. Although he did not make common cause with Luther, Mutianus and his followers boldly attacked the abuses of the Church, and it seems certain that the *Epistolæ Obscurorum Virorum* owed their authorship to this circle. Consult Gillert, *Der Briefwechsel des Conradus Mutianus* (Halle, 1890).

MUTINY (from OF., Fr. *mutin*, mutinous, from *meute*, sedition, from ML. *mota*, revolt, *muta*, change, from Lat. *mutare*, to change). Mutiny at military law is unlawful opposition or resistance to lawful military authority with intent to subvert the same or to nullify or to neutralize it for the time. (Winthrop, *Military Law*, p. 892.) The acts constituting mutiny are exciting, causing, or joining in any mutiny or sedition in any troop, battery, company, party, post detachment, or guard, and are punishable with death or such other punishment as a court-martial may direct. (Twenty-second Article of War.) The punishment of death or such other punishment as a court-martial may adjudge may be inflicted on any person in the naval service who commits any of the acts which constitute mutiny. (Revised Statutes, Sec. 1624.) In England an annual act of Parliament passes to punish mutiny in the army and navy. (See **MUTINY ACT**.) Under the British articles "every one commits felony, and is liable upon conviction thereof to penal servitude for life as a maximum punishment, the maximum alternative term of imprisonment being three years, who maliciously and advisedly endeavors (a) to seduce any person serving in His Majesty's forces by sea or land from his duty and allegiance to His Majesty; or (b) to incite or stir up any such person to commit any act of mutiny, or to make or endeavor to make any mutinous assembly, or to commit any traitorous or mutinous practice whatever."

While mutiny is, in general, a concerted proceeding, a single officer or soldier may commit the offense. It is an offense punishable with death for a soldier or officer being present at a mutiny not to use his utmost endeavor to suppress it, or having come to the knowledge of a mutiny (or intended mutiny), not to give information of it to his commanding officer. (British and American Articles of War.)

Acts not characterized by an intent to subvert lawful authority, while they do not come within the legal definition of mutiny, may be regarded and punished as conduct tending to mutiny, but clear of the completion or commission of the offense. The law makes a distinction between mutiny and mutinous conduct, the latter being charged, and tried by court-martial, not under

the mutiny articles, but as conduct to the prejudice of good order and military discipline.

MUTINY AT MARITIME LAW is committed when there is a usurpation of the authority and command of a ship and an overthrow of that of the master or commanding officer. Any conspiracy to accomplish such an object, or to resist a lawful command of the master for such purpose; any endeavor to stir up others of the crew to such resistance, is an endeavor to commit a revolt within the meaning of the statute of 1790. (1, Stat. L., 113; *Abbott's National Digest*, 3. Mutiny.) The offense of making a revolt or mutiny on a ship is no longer punishable as a capital offense. (Act of March 3, 1835.)

For United States law on the subject of mutiny, see Revised Statutes, Sec. 1324, Arts. 22 and 23; Sec. 1624, Arts. 4 and 8; Secs. 4956, 5359, 5360.

MUTINY ACT. An act of the British Parliament passed from year to year, investing the Crown with powers to regulate the government of the army and navy, and to frame the articles of war. By the Bill of Rights, the maintenance of a standing army in time of peace, unless by consent of Parliament, was declared illegal, and from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote. But Parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion; but the occurrence of a mutiny in a Scotch regiment soon after the Revolution of 1688, raised the question whether military discipline could be maintained in time of peace; and it was decided by the courts of law, that, in the absence of any statute to enforce discipline and punish military offenses, a soldier was only amenable to the common law of the country. The authority of the legislature thus became indispensable to the maintenance of military discipline, and Parliament, since 1689, at the beginning of every session, conferred this and other powers in an act called the Mutiny Act, limited in its duration to a year. In July, 1879, the Mutiny Act and the Articles of War were consolidated with a few changes into a complete military code called the Army Act, passed annually as before.

MUTSUHITO, mut'su-hē'tō or mut-t'sē'tō (1852—). The name of the present Emperor of Japan, but little used and unknown to the vast majority of his subjects. The common people call him *Tenshi Sama*, 'August Son of Heaven,' and educated folks say *Shu-jo*, 'Supreme Master.' He succeeded to the throne February 3, 1867. Still a youth, he exercised little control during the earlier part of his reign, while Japan was being transformed into a modern nation, and opinions differ as to his activity in later years. He accepted the part of a constitutional ruler, and his influence on the Government became less apparent than that of the least self-assertive European monarch. No hostile criticism has been directed against him and his character has been considered blameless. His history is merged in the history of the Empire. He married the daughter of a noble on February 9, 1869.

MUTTON-BIRD. See SHEARWATER.

MUTTON-FISH. (1) A fish of the large, widespread group of eel-pouts, the eel-pout or

mother-of-eels (*Zoarces anguillaris*) of the North Atlantic coasts. It feeds upon shellfish, may be caught with a hook in the bays north of Cape Cod, and reaches a weight of six to seven pounds. It spawns in late summer and produces a few large eggs. (2) One of the snappers (*Neomenis analis*) of the West Indies. (3) One of the mojaras (*Gerres olisthostomus*), also called 'Irish pompano.'

MUTTRA. The capital of a district in the United Provinces, British India, 23 miles north-east of Bhartpur, on the right bank of the Jumna (Map: India, C 3). The city extends in crescent form for about 1½ miles along the right bank of the river, to which access is facilitated from a paved street by numerous ghats and chatburahs, ornamented with pavilions and temples. The devotional ablutionary exercises of the mixed crowds morning and evening constitute one of the characteristic sights of the city. Ravines intersect the town, and the streets are narrow, dark, and steep. The Hardinge, or Holi entrance gate, is a notable monument, and the houses of some of the wealthier native class are adorned with fine sculptures. There are numerous mosques and temples, of which the Jumma Musjid, dating from 1660, is the chief. Among interesting remains are the ruins of Akbar's fort, centrally situated on the river bank, and the observatory built by the celebrated astronomer Jey Singh, who became Prince of Amber in 1693, still containing several astronomical instruments. Modern features are the museum, botanical gardens, the European churches, and the extensive military cantonments to the south of the city. As early as the fourth century, Muttra is mentioned as a centre of Buddhism: As the reputed birthplace of Krishna and his brother Balarama, it is annually visited by thousands of pilgrims on the occasions of its religious festivals. The river abounds with turtles, and the streets swarm with monkeys, peacocks, paroquets, and sacred bulls, which are permitted to roam at large, protected and fed by the people. Muttra anciently was of great importance, and its splendor and wealth made it an object of attack to the first Afghan invaders; Mahmud of Ghazni in 1017 plundered and burned the city and carried off idols of gold, silver, and precious stones, valued at \$1,500,000. In 1500, 1636, 1669, and 1756, it again suffered capture and spoliation. Since the British occupation in 1803, it has regained some of its former importance. During the Indian Mutiny of 1857, the Sepoys here murdered their British officers and joined the insurgents at Delhi. Population, in 1891, 61,195; in 1901, 60,042.

MUTUALISM (from *mutual*, from OF. *mutu*, from Lat. *mutuus*, reciprocal, from *mutare*, to change). That type of symbiosis (q.v.) in which each symbiont is believed to gain by the presence of the other. It has not been absolutely proved that a case of complete mutualism exists, though in the root tubercles (q.v.) of the Leguminosæ the evidence for mutualism is very strong.

MUTULE (Lat. *mutulus*, mutule, modillion). A rectangular block under the corona of the cornice of the Doric order. One is regularly placed over each triglyph and metope. On each mutule are worked three rows of six *guttae* or drops. They probably represent the heads of the nails by which the wooden block was fastened in the

primitive brick and wood style from which the Doric order developed.

MUTUUM (Lat., loan). A loan of any article or commodity for consumption by the borrower, who agrees to return the articles in *kind*. The term and the rules governing such contracts originated in the Roman law, and were adopted into the English and Scotch law at an early period and became a part of the common law. It is not a true bailment, as the article itself is not to be returned, and it does not create a debt, as no money payment is to be made. The title to the commodity lent passes to the borrower, and, therefore, it seems like a contradiction in terms to employ the terminology of bailments to such contracts. It has been held in a few States that the delivery of grain to a miller for grinding is a contract of *mutuum*, and that the miller is only bound to return flour of the same quality that the grain delivered would have produced. The important effect of this doctrine on such a state of facts would be that the miller would still be bound to deliver the flour if the grain were destroyed. Consult Story, *Bailments*; id., *Fun-gibles*.

MUYSKA, mû-ě'ská. A confederacy of South American Indians. See CHIBCHA.

MUZAFFAR-ED-DIN, mōō-zā'fēr-ēd-dēn' (1853—). Shah of Persia, the second son of Nasr-ed-Din (q.v.). He was born at Teheran, March 25, 1853. He was appointed Governor of the Province of Azerbaijan, but was recalled for failing to suppress an uprising of the Kurds. Already declared heir apparent during his father's lifetime, Muzaffar-ed-Din became Shah June 8, 1896, after Nasr-ed-Din's assassination by a Bābī (see BABISM) on May 1. In early life an almost fanatical Mohammedan, he showed great tolerance as Shah, particularly in his repression of an outbreak against the Christian Armenians at Kazoni in 1899. He further relieved his subjects at his accession of the taxes on meat and bread, and likewise abolished the system of purchase of civil and military positions. Of this change from his earlier character the European influence, especially that of the French, under which he came in Teheran, is the main cause. He twice visited Europe, first at the time of the Paris Exposition in 1900, when an unsuccessful attempt to assassinate him was made by an anarchist named Salson, and again in 1902.

MUZAFFARPUR, mûz'āf-ēr-pūr'. The capital of a district in Bengal, British India, on the right bank of the Little Gandak River, 37 miles northeast of Patna (Map: India, E 3). It is a well-built town with a numerously attended high school and a German mission. Saltpetre is largely mined in the district, and there is a considerable trade, especially in indigo and saltpetre. Population, in 1897, 49,192; in 1901, 45,617.

MUŽÁKOVÁ, mû'zhā-kō'vā, JOHANA (1830—). A Bohemian novelist, known by her pseudonym, Karolina Světlá. She was born at Prague and her name was Rott before she married Professor Mužák. After 1858, when her first novel, *Double Awakening*, was published, she produced more than fifty works of fiction, such as: *Láska k básníkovi* ("Poet's Love," 1860); *První Češka* (1861); *Vesnický román* ("Village Romance," 1869); *Frantína* (1870); *Kříž a potoka* ("The Cross Beside the Stream," 1871); and *Barbara* (1873), besides essays, memoirs, and songs.

MUZIANO, mōō'tsē-ē'nō, GIROLAMO (1528-92). An Italian painter of the Mannerist School. He was born at Aquafredda, near Brescia, whence he was also called Bressano. His first master was the painter Girolamo Romanino, and he afterwards studied in Venice under Titian. Proceeding to Rome, he adopted the manner of Michelangelo, whose favor he gained by his first painting of importance, "The Resurrection of Lazarus," now in the Quirinal Palace. He is best known for his improvement of mosaics and the foundation of the Academy of Saint Luke, which was largely due to his efforts and endowment. He was also celebrated among contemporaries for his landscapes. Most of his pictures are in the palaces and churches of Rome. Among the best are: "Descent from the Cross," Borghese Gallery; "Christ Giving the Keys to Peter," his masterpiece; and a "Flagellation," in the Vatican. His principal surviving frescoes are in the Vatican and at Foligno. Though an imitator of Michelangelo, he preserved the excellencies of Venetian coloring. He died in Rome, April 27, 1592.

MYALINA (Neo-Lat., diminutive of Lat. *mya*, from Gk. μύα, *mya*, sea-mussel, from μύς, *mys*, muscle, mussel, mouse). A fossil pelcepyod somewhat resembling in shape a mussel (*Mytilus*), that is very common in the Carboniferous and Permian rocks, and hence an index fossil of those periods. The genus is of interest also as possibly representing an intermediate stage between the Aviculidæ and Mytilidæ, with both of which families it has characters in common.

MYCALE (Lat., from Gk. Μυκάλη, *Mykalē*). The ancient name of a mountain, now called Samsun, in the south of Ionia in Asia Minor. It terminates in the promontory of Cape Santa Maria, opposite the island of Samos. To the shore of this promontory the fleet and army of Xerxes withdrew in B.C. 479 on the news of the approach of a Greek fleet. The Greeks under the Spartan King Leotychides and the Athenian Xanthippus, father of Pericles, followed them, landed, and after a severe struggle stormed the Persian camp and burned the ships.

MYCELIIUM (Neo-Lat., from Gk. μύκηρ, *mykēs*, fungus + ἥλος, *hēlos*, nail, wart). A collection of fungal filaments (hyphæ) making up the plant body. See FUNGI.

MYCENÆ (Lat., from Gk. Μυκῆναι, *Mykēnai*). An ancient city of Greece, situated on a steep hill in the northeastern corner of the Argolic Plain, commanding the passes toward Corinth. It was said to have been founded by Perseus and to have been ruled by his descendants until they were superseded by Pelops. It is celebrated in legend as the capital of Agamemnon. Here was laid the scene of the terrible story of the house of Atreus, and here was stored the wealth of Agamemnon. After the epic period, the city seems to have been completely overshadowed by the power of Argos, but it still preserved a quasi-independence, for during the Persian wars, when Argos was friendly to Persia, we hear of eighty Mycenæans at Thermopylæ, and along with Tiryns it sent two hundred men to Plataea. Later Mycenæ joined the Spartan league, but when the Spartans were occupied by the revolt of the Helots, in B.C. 463, the Argives besieged the city and expelled the inhabitants. From that time the place was the seat of a small

village community, who in the time of Pausanias showed visitors the graves of Agamemnon and his household. The destruction of the city by the Argives did not greatly injure the massive Cyclopean wall; and this fortification, with the 'Lion Gate,' so called from the reliefs on the triangular slab over the lintel, and the domed tomb outside, commonly called the 'Treasury of Atreus,' had attracted the attention of archaeologists long before Heinrich Schliemann in 1876 began his excavations. These opened an entirely new field in Greek archaeology by the discovery just inside the Lion Gate of a carefully inclosed circle, within which at a considerable depth were five graves, hewn in the rock, and containing a number of bodies with an extraordinary mass of gold and silver ornaments, swords, and vases. Since that time the Greek Archaeological Society has continued the excavations, for the most part through Dr. Tsountas, whose accurate and careful methods have proved highly successful. Besides the 'Treasury of Atreus,' eight other domed tombs and a very large number of smaller rock-cut chambers for burial have been opened. Within the wall a sixth grave was discovered near the others, the foundation walls of smaller houses were laid bare, while near the summit of the Acropolis were found the ruins of a palace showing great similarity to that at Tiryns. The discoveries at this site first brought into prominence that special period of Ægean civilization which preceded the historic Hellenic culture, and hence the name Mycenaean has been given to this age and civilization. Every year brings to light fresh material from this period, but until the recent discoveries in Crete no single site has yielded so large a variety of objects, or so complete a series of vases. For the general characteristics of Mycenaean art and for illustrations, see *ARCHÆOLOGY*. Consult: Schliemann, *Mycenæ* (London, 1878); Schuchhardt, *Schliemann's Excavations*, trans. by E. Sellers (London, 1891); Tsountas and Manatt, *The Mycenaean Age* (Boston, 1897); Ridgeway, *The Early Age of Greece*, vol. i. (Cambridge, 1901); Hall, *The Oldest Civilization of Greece* (Philadelphia, 1901).

MYCERINUS. An Egyptian king, the sixth of the Fourth Dynasty. His name, written by Herodotus as above, and by Diodorus, 'Mecherinus,' is, following the Egyptian form, 'Menkaura.' He built a pyramid southwest of Gizeh, the third in size and the first in point of preservation. In it in 1837 were found his stone sarcophagus (afterwards lost at sea) and fragments of his wooden coffin. Mycerinus was famed for his piety. He is the subject of one of the early poems of Matthew Arnold.

MYCETOZO'A (Neo-Lat. nom. pl., from Gk. *μύκης*, *mykēs*, fungus + *ζῷον*, *zōon*, animal). A small class of terrestrial Protozoa (q.v.).

MYCONIUS, FRIEDRICH (1491-1546). A German theologian of the Reformation. He was born at Lichtenfels in Upper Franconia, of a family named Mekum, and assumed the Latinized name Myconius. At the age of nineteen he entered a Franciscan cloister at Annaberg, and in 1516 became a monk. In the following year Myconius embraced Luther's teachings, and about 1524, as pastor of a church at Gotha, became one of the leaders of the Reformation. He rendered especially valuable service in Thuringia and, after 1539, in Leipzig, by reviving the primitive

custom of episcopal visits to the different churches. He attended several of the conferences of the Reformation period and in 1538 was sent on a mission to England. Myconius's *Historia Reformationis*, which contains much autobiographic matter, was published in 1710. Consult: Ledderhose, *Friedrich Myconius* (Gotha, 1854), and the biography by Meurer in his *Altträger der lutherischen Kirche* (Leipzig, 1864).

MYCONIUS, OSWALD (1488-1552). A Swiss reformer and friend of Zwingli. His real name was Oswald Geisbühler. He was born at Lucerne, studied and taught at Basel; then lived for three years (1516-19) at Zurich. After teaching at Lucerne and Einsiedeln he returned to Zurich. About 1532 Myconius became pastor at Basel, and was soon elected to succeed Ecolampadius as antistes of the district and professor of theology, a choice which met with Erasmus's disapproval. His great labor was the reform of the Swiss schools. In theology he mediated the views of Luther and Zwingli on the nature of the Lord's Supper, and finally came to a mystic interpretation of it. He wrote a *Life of Zwingli* (1532) and a commentary on Mark's Gospel (1538). Consult Hagenbach, *Oekolampad und Oswald Myconius, die Reformatoren Basels* (Elberfeld, 1859).

MYCORRHIZA (Neo-Lat., from Gk. *μύκης*, *mykēs*, fungus + *ρίζα*, *rhiza*, root). The whole structure formed by the intimate association of

MYCORRHIZA.

a. Root and rootlets of *Carpinus Betulus*, showing the coralloid character of mycorrhiza.
b. End of root of the beech (*Fagus sylvatica*), showing mat of fungus threads; more highly magnified than a.

certain fungi with the roots of higher plants. The fungi either grow inside the cells of the cortex (endotrophic mycorrhiza) or invest the young absorbing portions of the roots with a jacket of interwoven hyphæ (ectotrophic mycorrhiza, Fig. b.). Recent investigations have shown that mycorrhizal fungi are very widespread and that they are associated with perhaps more than half of the higher plants. They are particularly abundant in humus, and the conclusion has been reached that a large number of humus plants are very much benefited by their presence, and further, that some plants, such as the Indian pipe, certain orchids, and even the beech tree, are unable to complete their normal life cycle in sterilized soil. The relation between the fungus and the higher plants is not fully known, but it is believed that the fungus by its digestive powers secures and prepares certain foodstuffs, especially those containing nitrogen, for the roots. Whether or not the fungus gains benefit from the higher plants is not altogether clear, although it is probable that it lives in part as a parasite, getting certain carbohydrate foods. See SYMBIOSIS.

MYELAT, mē'a-lāt (Bur., unoccupied country). A division of Burma, India, comprising sixteen of the Southern Shan States, the largest having an area of 1600 square miles, and the smallest 4 square miles. Total area, 3723 square miles. The region is sparsely populated, the few inhabitants being chiefly occupied in the cultivation of rice and sugar-cane.

MYELITIS (Neo-Lat., from Gk. *μυελος*, *myelos*, marrow). An inflammation of the substance of the spinal cord which may be limited to the white or the gray matter and involve the whole cord or isolated portions of it. When the white matter is inflamed with the meninges it is called 'cortical myelitis;' when the gray matter only is affected it is known as 'central myelitis.' The disease may extend transversely, or may proceed in an upward or downward direction. The causes are, in general, injuries of various kinds, exposure, and overexertion; the infectious diseases, such as measles, typhus fever, and smallpox; and caries or tumors of the spine or the cord itself. The symptoms depend upon the extent and location of the inflammatory process. A transverse myelitis, for instance, produces complete paralysis of all the voluntary muscles whose nerve fibres arise from nuclei below the seat of the lesion. In children the disease attacks the anterior horns of the gray matter (when it is called *poliomyelitis* or 'infantile spinal paralysis'), and results in rapid loss of power and atrophy of certain groups of muscles.

MYER, ALBERT JAMES (1827-80). An American meteorologist, born at Newburg, N. Y. He graduated at Hobart College, and took his degree in medicine at the University of Buffalo in 1851. In 1854 he was appointed assistant surgeon in the United States Army, and was assigned to Texas, where he first developed his celebrated signal system of flags by day and torches by night, which afterwards came into general use. In 1860 he was commissioned major and made chief signal officer of the army. On the outbreak of the Civil War he was made signal officer on the staff of General Butler, and afterwards on that of General McClellan, and was successively brevetted lieutenant-colonel, colonel, and brigadier-general, his last promotion being for distinguished services in organizing, instructing, and commanding the signal corps of the army, and for especial service on October 5, 1864, at Allatoona, Ga., where his signal system enabled the apparently doomed garrison to summon assistance from the main army. On July 28, 1866, he was made colonel in the Regular Army and chief signal officer. In 1870 he commenced his work of observing and giving notice by telegraph of the approach and force of storms on the northern lakes and seacoast, at the military posts in the interior, and at other points in the States and Territories. He published *A Manual of Signals for the United States Army and Navy* (1868). A short time before his death he was promoted to the full rank of brigadier-general of the United States Army.

MYER, FORT. See FORT MYER.

MYERS, FREDERIC WILLIAM HENRY (1843-1901). An English poet and essayist, born February 6, 1843, at Keswick, where his father was incumbent of Saint John's Church. He was educated at Cheltenham, and at Trinity College, Cambridge, graduating with distinction, and gaining a fellowship in his college (1865). His taste for poetry was shown in his boyhood. He delighted in Homer, Æschylus, Lucretius, in fragments of Sappho, and in Pindar. Before quitting school he had learned all Vergil by heart. He was for many years inspector of schools. In 1882 he took an active part in founding the Society for Psychical Research, of which he became president. He died in Rome, January 17, 1901. The verse of Myers, which belongs mostly to an early period, comprises *Saint Paul* (1865); *Poems* (1870); and the *Renewal of Youth* (1882). In these collections are pieces of rare beauty, which give the author one of the first places among the lesser poets. Myers undoubtedly wrote some of the finest essays of his time in *Essays Modern and Classical* (1885), and in *Science and a Future Life* (1893). He also prepared for the "English Men of Letters Series" an admirable *Life of Wordsworth* (1880). His work in psychical research is represented by his contributions to the *Phantasms of the Living* (1886). After his death appeared a remarkable book on the evidences of immortality entitled *Human Personality and Its Survival of Bodily Death*, ed. by R. Hodgson and A. Johnson (London, 1903). Consult the *London Athenæum* for January 26, 1901.

MYERS, PETER HAMILTON (1812-78). An American author, born at Herkimer, N. Y. He practiced law in Brooklyn, and wrote a number of novels dealing with the early settlers of New York State, among which are: *The First of the Knickerbockers: A Tale of 1673* (1848); *The Young Patroon, or Christmas in 1690* (1849); *The King of the Hurons* (1849), republished in England under the title *Blanche Montaigne* (1856); and *The Prisoner of the Border: A Tale of 1838* (1857).

MYERS, PHILIP VAN NESS (1846-). An American educator and author, born at Tribes Hill, N. Y. He graduated at Williams College in 1871, studied law for a year, and then went to South America on a scientific mission. After two years in Europe he returned to the United States and became president of Farmers' College, Ohio, in 1879. In 1890 he was appointed profes-

sor of history and political economy at the University of Cincinnati, where five years later he was chosen dean of the academic faculty. His publications include: *Life and Nature Under the Tropics* (1871); *Remains of Lost Empires* (1875); and *Rome: Its Rise and Fall* (1890).

MYIASIS, mi-yä'sis (Neo-Lat., from Gk. *μῦα*, *myia*, fly). A medical term for the state of being infested with the larvæ of dipterous insects. A rather large number of flies may infest human beings in this way, and the disease has been divided according as the larvæ are found in the skin, in the ear, in the conjunctiva, in the intestines, in the mucous membranes, in the nose, or in wounds. The most common form is the presence of the larvæ of flesh-flies, or blow-flies, in open and neglected wounds. In certain portions of the United States, the screw-worm fly (*Lucilia macellaria*) deposits its eggs or larvæ not only in open sores upon the bodies of men and women, but many cases are on record where the eggs have been deposited in the nostrils of persons sleeping exposed in the daytime. These flies are especially apt to be attracted by an offensive catarrhal condition. Scores of maggots have been taken from the nasal passages of such individuals, and a complete destruction of the soft palate has been brought about in this way. The European flesh-fly known as *Sarcophila Wohlfarti* has been reared from larvæ found in numbers in the nasal cavities and in the ear of man. *Lucilia nobilis* of Europe has also been reared from the ear of a man, causing extensive discharges and much putrefaction. The bluebottle fly (*Caliphora vomitoria*) sometimes causes nasal myiasis, and the common flesh-fly (*Sarcophaga carnaria*) has been reared from larvæ found in the nasal passages. There are also cases of myiasis of the vagina. In all of these instances the flies are either Sarcophagidæ or Muscidæ, and the adults were attracted to putrid or septic wounds, or to an offensive or purulent discharge from the body, depositing their eggs or larvæ therein. Internal myiasis is nearly always caused by the larvæ or flies of the family Anthomyiidae. These flies deposit their eggs in spoiled vegetables, which are afterwards eaten in the raw state, as in salads. The larvæ of several species have been passed while still alive, and frequently cause intestinal disturbances of a more or less serious character. *Homalomyia canicularis*, for example, has several times been reared in this way. In the family Sepsidæ, the common cheese maggot (larva of *Piophilæ casei*), taken into the stomach with old cheese, has been found alive in excreta, having passed through the entire alimentary canal. Cutaneous myiasis, aside from that of open wounds, is produced by several of the bot-flies of the family Cæstridæ. In tropical regions there are one or more species of the genus *Dermatobia*, which may lay their eggs upon the skin of human beings, the resulting maggot forming a pus-sac below the surface of the skin, and, if undisturbed, reaching its full growth in this situation. Such cases as this are not uncommon among the unclothed inhabitants of tropical countries, and persons while bathing occasionally become infested. The best known of these human bot-flies is *Dermatobia cyaneiventris*, common in South America.

MYLITTA. A word long believed to be the name of a Babylonian deity, on the authority of

Herodotus, who describes the cult of Mylitta in Babylonia. As a matter of fact, Mylitta is a corruption of the Babylonian *belit* (lady), used as a title of the goddess, who is more properly known as Ishtar (q.v.). She originally represented the female portion of the twofold principles through which all creation burst into existence, and which, by their united active and passive powers, uphold it. Ishtar, however, developed other qualities besides those typical of procreation. She is a goddess of war, who, armed with sword, arrows, and spear, marches at the head of the Assyrian armies. Consult Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898).

MY'LODON (Neo-Lat., from MGk. *μυλῶδους*, *mylodous*, molar, from Gk. *μύλη*, *myle*, mill, mill-stone + *ὀδός*, *odous*, tooth). A gigantic extinct edentate mammal, allied to Megatherium and Megalonyx, found in the Pleistocene deposits of North and South America. See MEGATHERIUM.

MY'NA-BIRD, or **MINA-BIRD** (Hind. *mainā*, starling). A starling (*Sturnia religiosa*) of the East Indies, deep velvety black in color, with a white mark on the base of the quill-feathers of the wings, yellow bill and feet, and two large bright yellow wattles at the back of the head. It is very lively and intelligent, and possesses a power of imitating human speech excelled by none of the parrots. It has sometimes been trained to repeat sentences of considerable length. It is therefore in great request, and is often brought to Europe and America, while in India it is one of the most familiar and interesting of village birds, and is regarded by the Hindus as sacred to Ram Deo.

MY NOVEL; OR VARIETIES IN ENGLISH LIFE. A novel by E. Bulwer-Lytton (1853). The story, told by P. Caxton, is partly of Hazelden and partly of London. The principal hero is Harley L'Estrange, witty and brilliant, the friend of Squire Hazelden. He at first fancies Helen Digby, who marries Leonard, the son of Colonel Egerton, by an early, secret marriage, and finally marries Viola, daughter of an Italian gentleman, who with his friends forms a secondary story. The plot is involved, but the novel is one of Bulwer's finest productions.

MYOCARDITIS (Neo-Lat., from *myocardium*, from Gk. *μῦς*, *mys*, muscle, mouse + *καρδία*, *kardia*, heart). An inflammatory affection of the wall of the heart. It is a term first used by Sobernheim in 1837. Myocarditis is considered as an inflammation due to infection. It is a disease secondary to typhoid fever, diphtheria, scarlet fever, cerebro-spinal meningitis, variola, erysipelas, malaria, rheumatism, influenza, or septicæmia. See HEART, DISEASES OF.

MYOMANCY. See SUPERSTITION.

MYOPIA (Neo-Lat., from Lat. *myops*, from Gk. *μυωπ*, short-sighted, from *μῦς*, *myein*, to close + *ὥψ*, *ōps*, eye). Short sight. A form of ametropia due to the fact that the antero-posterior axis of the eyeball is too long; and hence its refracting media are not proportionately diminished in power. Parallel rays of light, therefore, are not brought to a focus on the retina, but in front of it, forming circles of diffusion on the retina. See SIGHT, DEFECTS OF.

MY'OSIN. See GLOBULINS.

MYOSOTIS. See FORGET-ME-NOT.

MYRIAPODA (Neo-Lat. nom. pl., from MGk. *μυρίαπους*, *myriopous*, having ten thousand feet, from Gk. *μύριος*, *myrioi*, ten thousand + *πούς*, *pous*, foot). A class of arthropods resembling annelids in their lengthened form, and in the great number of equal, or nearly equal, segments of which the

FORMS OF MYRIAPODS.

1. *Geophilus*. 2. *Polydesmus*.
3. *Julus*.

body is composed; but in most of their other characters more nearly agreeing with insects, among which they were ranked by the earlier naturalists. They differ from insects and all other arthropods in the fact that the posterior segments of the body bear jointed locomotor appendages. In addition to their affinities with insects, myriapods are worm-like and some of them suggest relations with the thysanurans. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organization the myriapods resemble insects, although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the myriapods is protected by a hard chitinous covering. The number of segments is various, seldom fewer than 24, although in some of the genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus*, are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion and the distinctly articulated legs of insects. In the higher myriapods, as *Scolopendra*, the legs are much fewer, and articulated like those of insects. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organization are carnivorous. The myriapods do not undergo marked metamorphoses, but the young greatly resemble the adults, although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached—the number of segments and of feet increase.

Myriapods are widely distributed, and are represented in almost every part of the earth. They flourish in moist and dry, hot and cold climates. Like other widely distributed animals, they show great variation in size and color, ranging from microscopic size to a length of more than six inches. Some of the *Julidæ* and *Polydesmidæ* of the tropics are beautifully and brilliantly col-

ored. Some of the species of *Geophilus* are phosphorescent. Most myriapods inhabit dark and obscure places. Some of the cave-inhabiting species from Wyandotte and Bradford caves in Indiana are described by Packard as light in color, and those from the latter cave have rudimentary eyes. The organs of defense throughout the class vary greatly. In the centipedes the large claws, supplied with poison from a gland, are weapons of offense and defense. The millipedes, on the other hand, rely for defense on an acid secretion from certain glands. Other forms are hairy or bristly. Hairiness was the most common mode of defense among fossil myriapods.

A fossil bristled myriapod has been found in America in Paleozoic strata, and two species have been found in the Old Red Sandstone of Scotland. The highest vertebrates in this deposit are fishes, and the highest plants are conifers. The Paleozoic species, about forty in number, all belong to an extinct order (*Archipolyпода*) and most of them were of gigantic size. Later fossil myriapods, contemporaneous with giant fossil Amphibia, occur in the coal measures. One of these forms from Illinois approaches very closely the *Julidæ* of to-day. Only one species has been found in the chalk layers, but in Tertiary and recent times plentiful remains have been found. The majority of these belong to the *Chilognatha* and *Chilopoda*. They have been found in the gypsum of France, in the brown coal of Germany, and in the Green River formation of North America. Amber has also yielded several species.

CLASSIFICATION. The class Myriapoda is now divided into five orders, the *Chilognatha* or *Diplopoda*, the *Chilopoda* or *Syngnatha*, the *Schizotarsia*, the *Symphyla*, and the *Pauropoda*. To the *Chilopoda* belong the common thousand-legs of the family *Julidæ*, as well as the representatives of seven other families, all of which bear two pairs of legs to each of the body segments except the first three. Verloef states that the males of some of the *Julidæ* undergo certain seasonal changes. In the spring and autumn the form of the legs and other organs changes. These seasonal changes are correlated with the sexual condition of the *Julus* just as the males of certain birds and fishes show a brighter coloration and other changes at the breeding season. *Julus* will feed freely in captivity if the earth is kept at the proper moisture and proper food is furnished plentifully. They will thrive on grass, leaves, and bits of apple and pear. The eggs are numerous, from 60 to 100 being deposited at a laying. The female forms a receptacle for the eggs some distance below the surface of the ground. It is in the shape of a hollow sphere, and is composed of little pellets of mud, which are molded by her jaws and front legs. The nest is perfectly smooth within, but the outside is rough and shows the pellet composition. In the top of the sphere a small opening is left until the eggs are laid. The hole is then plugged up with earth and the eggs are left to chance. The *chilopods* have many-jointed antennæ and only one pair of legs to each joint. To this group belong the large tropical centipedes of the family *Scolopendridæ* and the long slender *Geophilidæ*, as well as the *Lithobilidæ* and *Notophilidæ*.

The order *Schizotarsia* contains but a single family, the *Scutigera*, of which the common household centipede of the United States (*Scuti-*

gera forceps) is a familiar example. This creature, although viewed with horror by careful housekeepers, preys upon house-flies and small cockroaches, and is by no means an entirely undesirable denizen of households. It is prevalent in the Southern States, and extends as far north as the Hudson River Valley. The order Symphyla contains the single family Scolopendrellidæ, which have a great resemblance to certain of the Thysanura among the insects. The order Pauropoda consists of the single family Pauropodidæ, which contains only three genera. The type-genus, *Pauropus*, a curious crustacean-like form, was first discovered by Lord Avebury (Sir John Lubbock) in his kitchen garden in 1866.

Consult Sinclair, *Cambridge Natural History*, vol. v. (London, 1895); Scudder, "Systematic Review of Our Present Knowledge of Fossil Insects, Including Myriapods and Arachnids," in *Bulletin of the United States Geological Survey*, No. 31 (Washington, 1886).

MYRICA. An Asiatic and North American shrub. See CANDLEBERRY.

MYRISTIC ACID (from Neo-Lat. *Myristica*, from Gk. *μυριστικός*, *myristikos*, suitable for anointing, from *μυρίζω*, *myrizō*, to anoint, from *μύρον*, *myron*, unguent), $C_{15}H_{27}COOH$. A crystalline fatty acid, found in nutmeg, the seed of *Myristica fragrans*, growing on the Molucca Islands, and cultivated in tropical countries. It occurs in the form of a glyceride in the fat of the nutmeg, or nutmeg butter. It has also been found in small quantity among the products of the saponification of spermaceti, and of the fatty matter of milk; and hence this organic acid is one of those which are common to both the animal and vegetable kingdoms.

MYRMECOPHILY. See MYRMECOPHYTES.

MYRMECOPHYTES (from Gk. *μύρμηξ*, *myrmēx*, ant + *φυτόν*, *phyton*, plant), or MYRMECOPHILOUS PLANTS. Plants in which there are symbiotic relations between the plants and ants. Typical myrmecophytes are most commonly found in the tropics, and present peculiarities that are hard to explain in a purely scientific way. In some cases ants cut off leaves, take them to their nests, and raise crops of fungi that serve them as food. In other cases, as in the famous South American *Cecropia*, ants live in peculiar chambers within the plant, and feed upon products that appear to be useless so far as any other purpose is concerned. They appear, on the other hand, to defend the plants in which they dwell against leaf-cutting ants and other enemies. The relation here outlined is one of the most remarkable known types of symbiosis. The terms myrmecophily and myrmecophilous should be discarded for myrmecophytism and myrmecophytic. See SYMBIOSIS.

MYRMIDONES (Lat., from Gk. *Μυρμιδόνες*). In the *Iliad*, the Achæans of Phthiotis, in the south of Thessaly, ruled by King Peleus, and led to the Trojan War by his son Achilles. Later writers discovered an eponymous hero Myrmidon, son of Zeus, and father of Actor, the husband of Ægina, daughter of Asopus, who was by Zeus the mother of Æacus. For him Zeus changed the ants (*μύρμηκες*, *myrmēkes*) on the island of Ægina to men, and this race later wandered to Thessaly. The story is evidently due to the resemblance which the Greeks saw between Myrmidones and myrmēkes.

MYROB'ALAN (Lat. *myrobalanum*, from Gk. *μυροβάλανος*, *myrobalanos*, from *μύρον*, *myron*, unguent + *βάλανος*, *balanos*, acorn). The astringent fruit of certain species of *Terminalia* (natural order Combretaceæ), natives of the mountains of India. *Terminalia bellerica* and *Terminalia chebula* produce most of the myrobalans of commerce, but the fruits of other species often appear. Formerly myrobalans were credited with tonic properties; now they are rarely used medicinally. They are largely exported for tanners' and dyers' use, since they give a durable yellow with alum and an excellent black with iron. A number of species are valuable for timber, the best known of which, *Terminalia catappa*, is a large deciduous tree planted in many tropical countries. It is a popular shade tree in Honolulu, where it is called Mexican almond from the almond-like flavor of the nuts.

MY'RON (Lat., from Gk. *Μύρων*). An Athenian sculptor, who flourished about the middle of the fifth century B.C. He was a native of Eleuthera, near the Boeotian frontier of Attica, and is called a pupil of Hagelaidas of Argos. In his style he belongs in the period of transition just before Phidias, but his works show also a remarkable power of observation and great technical skill. He seems to have taken special pleasure in representing vigorous action, and to have indicated emotion rather by gesture and position than by expression. He was a worker in bronze, and also skilled in the engraving of plate. No original work has survived, but late copies of some of his statues are extant. Of these the most famous is the Discobolus (q.v.), or discus-thrower, of which there are specimens in the Vatican and the British Museum, though the best copy is in the Palazzo Lancellotti in Rome. (See illustration under GREEK ART.) Another work was a group on the Acropolis of Athens of Marsyas preparing to pick up the flutes thrown away by Athena, but starting back at the approach of the goddess. A copy of the Marsyas is in the Lateran Museum in Rome. In antiquity a bronze cow on the Acropolis was especially famed for its truth to nature. Many epigrams on the statue of the runner Ladas have also come down to us. Consult, in addition to the histories of Greek art, Furtwängler, *Masterpieces of Greek Sculpture*, Eng. trans. by E. Sellers (London and New York, 1895).

MYRRH. An umbelliferous plant. See CICYLY.

MYRRH (AS. *myrre*, *myrra*, from Lat. *myrrha*, *murrha*, *murra*, from Gk. *μύρρα*, *myrrha*, *myrrh*, from Aramaic *māra*, Heb. *mōr*, Ar. *murr*, *myrrh*, from Aramaic *mārr*, Heb. *mārar*, Ar. *marra*, to be bitter). A gum resin produced by *Balsamodendron myrrha*, a tree of the natural order Amyridaceæ, growing in Arabia and in Eastern Africa. The myrrh tree is small and scrubby, spiny, with whitish-gray bark, thinly scattered small leaves, consisting of three obovate obtusely toothed leaflets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. Myrrh exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the color at the same time becoming darker. Myrrh appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or red-

dish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, etc., also to cleanse foul ulcers and promote their healing, and as a mouth-wash and gargle, particularly in a spongy or ulcerated condition of the gums. The best myrrh is known as Turkey myrrh, being brought from Turkish ports. Most of the myrrh of commerce, however, passes either through Aden or through Bombay. The chief constituents of myrrh are: A resin known as myrrhin; a gum; a volatile oil known as *myrrhol* and having the composition $C_{10}H_{16}O$, and a bitter principle. An excellent mouth-wash for sore gums may be prepared by mixing 1 part of myrrh, 16 parts of eau de cologne, 1 part of borax, 3 parts of water, and 3 parts of syrup.

MYRTACEÆ (Neo-Lat. nom. pl., from Lat. *myrtus*, Gk. *μύρτος*, *myrtos*, myrtle, from Pers. *mārd*, myrtle), or **MYRTLE FAMILY**. A natural order of dicotyledonous trees and shrubs. Even as restricted by some botanists, who exclude various groups as orders which other botanists consider as suborders of the Myrtaceæ, this order contains about 70 genera and over 2000 species, chiefly natives of warm countries, but represented in temperate climates. Some of the species are gigantic trees, as the Eucalyptus or gum trees of Australia, and certain species of *Metrosideros*. The timber is generally compact. Astringency seems to be characteristic of the order, and the leaves or other parts of some species are used in medicine for this property. A fragrant or pungent volatile oil is often present in considerable quantity, of which oil of cajuput and oil of cloves are examples. Cloves and pimento are among the best known products of this order. The berries of several species are occasionally used as spices. A considerable number yield edible fruits, among which are the guava, species of the genus *Eugenia*, and some species of *Myrtus*. The pomegranate (*Punica Granatum*), which some botanists place in this

order, Engler makes the type of the order *Punicaceæ*. Benth and Hooker place it in the order *Lythraceæ*. The chief genera of the order as limited by Engler are *Myrtus*, *Psidium* (the guava), *Pimenta* (allspice), *Eugenia* (cloves), *Metrosideros*, *Eucalyptus*, *Melaleuca*, and *Darwinia*.

MYRTLE (*Myrtus*). A genus of plants of the natural order Myrtaceæ. The common myrtle (*Myrtus communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of the Mediterranean region and of

COMMON MYRTLE (*Myrtus communis*).

the temperate parts of Asia. The leaves are astringent and aromatic, contain a volatile oil, and were used as a stimulant by the ancients. The berries are also aromatic, and are used

in medicine in Greece and India. A myrtle wine, called myrtidanum, is made in Tuscany. Myrtle bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks the myrtle was sacred to Venus as the symbol of youth and beauty, and was much used in the festivals. It is often mentioned in poetry. The small-leaved myrtle (*Myrtus microphylla*) of Peru has red berries of the size of a pea, of a pleasant flavor and sugary sweetness. Those of the luma (*Myrtus Luma*) are also palatable, and are eaten in Chile, as are those of *Myrtus Ugni*, the Chilean guava, which is said to become a large tree with very hard and useful wood. These species have all been successfully grown in California as outdoor ornamental shrubs.

MYRTLE-BIRD. The American yellow-rumped warbler (*Dendroica coronata*). It is about $5\frac{1}{4}$ inches long, bluish ash above, streaked with black; white below, with a black patch on the breast; crown, rump, and sides bright yellow, and the throat white. It is one of the most numerous and earliest of spring migrants in the United States, and scatters all over the country, but passes on to the north, and few breed south of the latitude of Lake Ontario. The name refers to the prevalence of this warbler in the Southern States in winter, where they feed on berries, especially those of the wax-myrtle (*Myrica cerifera*). From the Rocky Mountains to the Pacific Coast a very similar species (differing mainly in having the throat yellow) takes the place of the Eastern form; it is known as Audubon's warbler (*Dendroica Auduboni*).

MYRTLE FAMILY. A popular name for the natural order Myrtaceæ (q.v.).

MY'SIA (Lat., from Gk. *Μυσία*). In ancient geography, a district in the northwest of Asia Minor, bounded on the north by the Hellespont and Propontis, on the east by Bithynia and Phrygia, on the south by Lydia, and on the west by the Ægean. In a stricter sense, Mysia was only the southeastern part of this district. The principal rivers were the Granicus, Scamander, Caicus, Æsepus, and Rhyndacus. The surface is mountainous in the interior, and in part tableland, among the mountains being Ida in the west and Olympus in the east. The inhabitants were thought by some ancient writers to be of Thracian, and by others of Lydian descent; probably there were immigrations from both countries. Mysia was subject to the Lydian monarchy, and under the Persian dominion formed, together with Lydia, one of the satrapies created by Darius. After the death of Alexander the Great it shared in the vicissitudes of Asia Minor during the wars of his successors and the Gallic invasion, but first assumed prominence in history with the rise in the third century B.C. of the Kingdom of Pergamum. Among its principal towns were Abydos, Cyzicus, Prusa, Lampsacus, Adramyttium, Alexandria Troas, and Pergamum.

MYSLOWITZ, mîs'łô-vîts. A town in the Province of Silesia, Prussia, on the Przemsza, 110 miles southeast of Breslau (Map: Prussia, H 3). Coal-mining, zinc-refining, flax-spinning, and brick-making are its principal industries. Population, in 1900, 13,365.

MYSORE, mî-sôr', or **MAISUR**, mî-sôor'. A native State of Southern India, bounded on the east, south, and west by Madras, on the south-

west also by Coorg, and on the north by Bombay and Madras (Map: India, C 6). Area, 27,936 square miles. The country consists of a plateau from 2000 to 3000 feet above the sea, inclosed in the angle between the Eastern and Western Ghats. Its surface is undulating, somewhat level in the east, but rugged and mountainous in the west, where it is heavily forested and sparsely populated. It consists mainly of primitive rocks, and basaltic trap formations are common; the *drugs*, precipitous rocky masses rising more than 1000 feet above the plateau, are characteristic features of the State. The rivers are all unnavigable mountain streams; most of them flow toward the Bay of Bengal, and are largely utilized for irrigation purposes; the northern streams belong to the basin of the Kistna, and the southern to the Kavery basin. Grain and oil-seeds form the major part of the crops. The betelnut and coconut palm are important, and coffee is grown in large quantities. There are a number of gold mines in the eastern part of the State.

Mysore is ruled by a Maharaja, whose word practically is law. A representative assembly meets annually, but its powers are limited to discussion. The State maintains a small military force of about 4000 men. An annual tribute is paid to the British Government in consideration of military protection. British interests are looked after by a political agent who resides at Mysore, the capital. In 1901 the population was 5,538,482, showing an increase of 12 per cent. for the decade. Nearly 94 per cent. of the population are Hindus. The remainder are mainly Mohammedans. The principal town is Bangalore.

HISTORY. Frequently mentioned in Hindu literature under the rule of various dynasties, the territory was merged with the Balala Kingdom of Delhi after the Mohammedan invasion of the fourteenth century. After the overthrow of the Ballala rule by Ala-ud-Din, a new State arose, including Mysore and part of the Carnatic, with Vijayanagar as capital. In 1565 its ruler, Raja Ram, was defeated and killed at the battle of Talikot by a Moslem confederation, and the State again became divided under the rule of several minor chiefs. One of these, Raja Wodeyar, captured Seringapatam in 1610, and his successors strengthened their rule until, at the close of the seventeenth century, their sovereignty extended throughout Mysore. This dynasty was supplanted in the eighteenth century by Hyder Ali (q.v.), the formidable foe to the rising British power in India. By the defeat and death of his son Tipu, Sultan at Seringapatam, in 1799, the State came under British control. Part of the territory was annexed to India, and a descendant of Wodeyar was appointed to rule over the remainder. Owing to misrule, the British took charge of the administration from 1831 to 1881.

MYSORE, or MAISUR. The capital of the native State of the same name, India, 10 miles southwest of Seringapatam and 245 miles southwest of Madras (Map: India, C 6). The town is picturesquely situated in a valley at the foot of the temple-crowned Chamundi Hill, which rises on the southeast 3489 feet above the sea. It is a well-built town, with wide and regular streets; area, about three square miles. The houses generally are built of teak and roofed with tiles; the chief buildings are the quadrangular fort inclosing the Maharaja's palace, the

Residency, the Mohan Mahal or pleasure palace, the summer palace, and the European churches. Modern methods have greatly improved the sanitation of the town. The manufacture of carpets is the leading industry, and there is an active trade in the products of the State. Mysore was tributary to Seringapatam until its ruler captured that city in 1610, and henceforth it was the capital of the State and the seat of the Raja. During the period of English rule (1831-81), the capital was removed to Bangalore. Population, in 1891, 74,048; in 1901, 68,111.

MYSTAGOGUE, *mīst'ā-gōg* (Lat. *mystagogus*, from Gk. *μυσταγωγός*, one who introduces into mysteries, from *μύστης*, *mystēs*, initiate, from *μύειν*, *myein*, to initiate, close the lips or eyes, from *μύ*, *my*, slight sound made by the lips + *αγωγός*, *agōgos*, leader, from *άγειν*, *agein*, to lead). In the Greek religious system, the functionary who directed the preparations of the candidates for initiation in the mysteries (q.v.). They were men who had passed through all the grades of initiation, and were probably under the cognizance of the State. Prior to presenting himself for initiation, each votary had to place himself under the guidance of one of these mystagogues, and received instruction from him as to the various purifications and ceremonies to be performed. The mystagogue passed upon the fitness or unfitness of the applicant to receive the rites. In the Christian writers the term is used of the priest who prepared candidates for the sacraments of baptism, confirmation, and the Eucharist.

MYSTERIES (Lat. *mysterium*, from Gk. *μυστήριον*, *mysterion* from *μύστης*, *mystēs*, initiate). Secret rites connected with the Greek religion. They have been divided into two groups: (1) those where the participants were a small circle of priests, officially connected with the sanctuary, and (2) those where the participants were numerous. Naturally our information on these matters is very scanty, and by no means trustworthy, and the subject has been a fertile field for ingenious speculation. For a long time the view was prevalent that the mysteries concealed deep truths and the remnants of a primitive revelation, too profound for the popular mind. The chief representative of this doctrine was Creuzer in his *Symbolik und Mythologie der alten Völker* (4 vols., Leipzig and Darmstadt, 1836-43). The death-blow to these theories, so far as critical scholarship was concerned, came from Lobeck, who in his *Aglaophamus* (Königsberg, 1829) showed that such occult wisdom was no part of their teaching. Mysteries were numerous in Greece, and were celebrated in honor of many gods, but in only a few places did they reach a national importance. Of these the most celebrated and revered were the Eleusinian mysteries, connected with the worship of Demeter and Cora (or Persephone) at Eleusis (q.v.) in Attica. With these goddesses there appear in the Eleusinian cult an anonymous god and goddess (*θεός*, *theos*, and *θεά*, *thea*), Pluto, Iacchus, Triptolemus, and Eubuleus, whose connection with the worship is by no means clear. The rites and legends connected with this cult are very similar to those prevailing not long ago among the European peasants, and point clearly to a similar belief in a 'corn-spirit,' which dies and is reborn yearly. So far as can be judged, the Eleusinian mysteries consisted large-

ly in the rehearsal before the initiated (*μύσται*, *mystai*) of a sort of miracle play, in which the rape of Cora, the sufferings of Demeter, and the final reunion of mother and daughter, together with the bestowal of the art of agriculture on man by Demeter, were represented in dramatic form. The initiation seems to have symbolized the redemption of the soul from the powers of the lower world and its reception by the goddess as pure. So far as can be learned from literature and art, the candidate was purified by a sacrifice, which he himself brought, and, after fasting and preparation, wandered through a series of dark and confused passages, beset by terrifying sights and sounds, but emerging at last into the light where he saw the goddesses. We know that candidates had to be initiated first into the Lesser Mysteries at Agræ, near Athens, six months before the ceremonies at Eleusis. The *Mystæ* seem to include all, while those who had been fully received are sometimes called *ἐπίσται*, *epoptai*, 'those who see.' As to the public ceremonial, we are better informed. The Lesser Mysteries were celebrated in the month Anthesterion (approximately February). They were accompanied, like the Greater Mysteries, by a sacred truce. The Greater Mysteries were celebrated in Boëdromion (approximately September) at Eleusis, though there was much preliminary ritual at Athens. On the 14th certain sacred relics (*τὰ λεγὰ, ta hiera*) were brought from Eleusis to Athens and deposited in the Eleusinia; the next day seems to have been given to the gathering of the celebrants; on the 16th the *Mystæ* went in procession to the beach at Phalerum for solemn purification in the salt water; the 17th and 18th were filled with offerings and ceremonies at various sanctuaries in Athens; on the 19th, early in the day, the sacred procession escorted the image of Iacchus and the sacred relics to Eleusis. At the bridge over the Cephissus jests and gibes were exchanged, and it was evening (hence the 20th in Greek reckoning) when they arrived at the great sanctuary. The following nights and days were given up to the performance of the sacred ritual and the ceremonies of initiation, which certainly made a strong impression on the spectators. On the 23d the ceremonies closed with a solemn pouring out of water from two earthen jars toward the east and west. It is certain that no dogmatic teaching formed part of the Eleusinian worship. The chief officials connected with this sanctuary were the Hierophant, who was always from the Eleusinian family of the Eumolpidæ, and from the family of the Kerykes, the Dadouchos or torch-bearer, the Hierokeryx or herald, and the priest at the altar (*ὁ ἐπὶ βωμῷ ἱερεὺς, ho epi bómō hierews*). In connection with the celebration a sacred truce, extending from the full moon of the previous month to the tenth day of the following was proclaimed so that the *Mystæ* could travel in security. Initiation was open to all ages and conditions, including even slaves, provided they were Hellenes (or later Romans), and were free from any great crime. Eleusinian mysteries were celebrated on a smaller scale at Phlius, Megalopolis, and elsewhere, while at Andania, in Messenia, they appear in combination with the Samothracian worship of the Cabiri.

Consult: Mommsen, *Feste der Stadt Athen* (Leipzig, 1898); Nebe, *De Mysteriorum Eleusiorum Tempore et Administratione Publica*

(Halle, 1886); Strube, *Bilderkreis von Eleusis* (Leipzig, 1870, 1872); Foucart, *Recherches sur l'origine et la nature des mystères d'Eleusis* (Paris, 1895), and *Les grands mystères d'Eleusis* (ib., 1900), very valuable, though the author's theory of the Egyptian origin of the mysteries is not generally accepted; Gardner, *New Chapters in Greek History* (London, 1892), and the works cited under ELEUSIS.

Next to the Eleusinian the most prominent were the Samothracian mysteries of the Cabiri or great gods. Originally these seem to have been two in number, though later we find two goddesses added, and the four, Axieros, Axiokersa, Axiokersos, and Kasmilos, were identified by the grammarians with Demeter, Persephone, Hades, and Hermes. The rites were believed to afford protection against the perils of the sea, and were doubtless in early times largely confined to seamen. Consult: Conze, *Archäologische Untersuchungen auf Samothrake* (Vienna, 1875-80), and Preller-Robert, *Griechische Mythologie*, i. 2 (Berlin, 1894).

Another sanctuary of the Cabiri lay near Thebes, where we find the deities worshiped as Cabiros and Pais, or 'boy.' The objects found seem to indicate that these mysteries were orgiastic in character. See *Athenische Mittheilungen des deutschen archäologischen Instituts*, vols. xiii. and xv. (Athens, 1888-90).

In the course of time other mysteries, such as those of Isis, Sabazios, Mithras, and other Oriental deities, spread through the Greek world, and at all times there were private sects, like the followers of Orpheus (q.v.), who professed to possess secret teachings which could insure peace and happiness in the other world to those who followed their directions here.

On the general subject of the Mysteries, consult in addition to the books named above: Petersen, *Der geheime Gottesdienst bei den Griechen* (Hamburg, 1848); Rohde, *Psyche* (3d ed., Leipzig, 1902); Aurich, *Das antike Mysterienwesen in seinem Einfluss auf das Christentum* (Göttingen, 1894).

MYSTERIES OF UDOLPHO. A novel by Mrs. Ann Radcliffe (1794). This once popular romance tells of the Castle of Udolpho in the Apennines, where terrific scenes of horror occur. The victim of these supernatural events is an English girl, Emily Saint Aubyn, who is finally rescued by her lover, the Chevalier Velancourt.

MYSTERY. The name given to a very early type of the mediæval drama, founded upon some part of the Bible narrative, and in England often used indiscriminately with that of miracle play (q.v.). The traditions of the ancient drama survived to some extent the fall of the Western Empire, and on them were modeled religious plays, intended less for acting than for reading. There is extant a Greek play entitled *Χριστὸς Παθὼν* (The Passion of Christ), long attributed to Saint Gregory Nazianzen, but now thought to be of much later date, which follows the structure of the ancient Greek drama. In the second half of the tenth century, Hroswitha or Roswitha (q.v.), a Benedictine nun of Gandersheim in Saxony, wishing to provide her sisters with a substitute for Terence, who was widely read by the learned throughout the Middle Ages, cast six martyrdoms in the form of the old Latin comedy. Through imitations of this kind, the classic drama may be said to have continued to exert some influence as late as 1200. But the main im-

petus to a revival of popular dramatic literature came from the Church. The clergy wished to provide some means of making the great events on which their teaching was based more vivid and real to their unlettered flocks. This was the more natural because the service of the Church was in its very nature dramatic. Its chief act of worship was, in no abstruse sense, a representation of the sacrifice of Christ; and both the symbolism of the ritual and the responsive nature of the liturgy shared the same character. Especially at the great festivals of Christmas and Easter it was customary to make it still more dramatic by representing the events then commemorated as actually taking place before the congregation. Traces of this procedure are found as early as the closing years of the tenth century. The words used, the directions to the performers, hymns and anthems, were at first in Latin; but as dialogue was introduced, they were naturally turned into the vernacular. In the thirteenth century, in fact, mysteries and miracle plays lost the favor of the Church. Where they were not still a part of the ritual, they were banished by various decrees from the sacred building, and the clergy were forbidden to take part in them. They passed first to the churchyard, and then to the streets and public squares, where they were performed on movable stages drawn from place to place. The actors in England were frequently members of the trade guilds, who arranged for these performances at Christmas, Easter, and Corpus Christi, supplemented by strolling players. In France they came under the control of the *Confréries de la Passion*, which were established in many of the leading towns—societies half religious, half literary, and wholly secularized by the fourteenth century. The plays devoted to the exposition of special mysteries were combined, in England at least, in an immense cycle, covering the entire range of the Scriptural narrative from the Creation to the Day of Judgment. In texts belonging to the fourteenth, fifteenth, and sixteenth centuries, four of these cycles, more or less complete, have come down to us. They are the York cycle (48 plays), the Towneley (32 plays), the Chester (25 plays), and the Coventry (42 plays); of other cycles there are fragments. The mystery plays died slowly as the regular drama came into existence. As late as 1580, we hear of one being represented at Coventry. Consult for both mysteries and miracle plays: Bates, *English Religious Drama* (New York, 1893); Hase, *Das geistliche Schauspiel des Mittelalters* (Leipzig, 1858; Eng. trans., London, 1880); Stoddard, *References for Students of Miracle Plays and Mysteries*, a classified list (Berkeley, 1887); Sepet, *Le drame chrétien au moyen-âge* (Paris, 1878); Pollard, *English Miracle Plays, Moralities, and Interludes*, with specimens (Oxford, 1890); Manley, *Specimens of the Pre-Shakespearean Drama*, arranged so as to show development (Boston, 1897); Wright, *Early Mysteries* (London, 1838); A. d'Ancona, *Sacre rappresentazioni dei secoli 14-16* (Florence, 1872); Ward, *English Dramatic Literature* (London, 1899); Jusserand, *Literary History of the English People* (ib., 1895); Petit de Julleville, *Les mystères* (Paris, 1886); Davidson, *Studies in the English Mystery Plays* (New Haven, 1892); and for reprints, besides the specimens given above, *York Plays* (ed. L. T. Smith, Oxford, 1885); *Chester Plays* (ed. Wright, London, 1843-

47); *Towneley Mysteries* (ed. Raine, Newcastle, 1836); *Digby Mysteries* (ed. Furnivall, London, 1882); *Miracles de notre Dame* (ed. G. Paris and Robert, Paris, 1876-81). See **DRAMA**; **MIRACLE PLAY**; **PASSION PLAY**.

MYSTERY OF EDWIN DROOD. The last and unfinished novel by Charles Dickens. The first number appeared in 1870 and only six were finished when he died. The scene is a cathedral town, where live a music teacher, John Jasper, and his young nephew, Edwin Drood. Both love the same girl, Rosa. Drood suddenly vanishes, and Neville Landless is accused by Jasper of murdering him. The story breaks off, and the mystery was never solved. Notes furnished by Dickens's son-in-law indicate that Jasper was the murderer, but that Rosa finally married Tartar, a sailor.

MYSTERY OF MARIE ROGET, *mâ'rê rô-zhû'*. A tale by Edgar A. Poe, published in three parts in *Snowden's Lady's Companion* (1842). It is a sequel to *Murders in the Rue Morgue*, the accounts of the murder of a beautiful Paris grisette, and a parallel, with other localities and names, of the murder of Mary Rogers at Weehawken, N. J.

MYSTICISM (from *mystic*, from Lat. *mysticus*, from Gk. *μυστικός*, *mystikos*, relating to mysteries, from *μύσσειν*, *mystēs*, initiate). The name given to certain forms of religious experience, in which man, transcending the ordinary limitations of time and sense, seems to hold direct communion with the Deity. Mysticism may be philosophical as well as religious, in which case its speculations are usually pantheistic in their tendency. Religious mysticism exhibits two wholly different qualities, curiously combined, viz. pure individualism and the sinking of personality. The mystic may have fervently striven to attain the exalted state of communion with God, yet when once it has been reached, conscious activity ceases, and through a sort of passive rapture the subject seems merged in the object of his yearning. Direct intuition supercedes reason. The mystic is not unconscious, yet he seems to be no longer self-conscious in the ordinary sense. The satisfaction which he feels is wholly different from that derived from ceremonial observances, for the true mystic is the opposite of a legalist. His attitude, indeed, is a protest against formalism. He feels himself to be independent of external authorities, whether of rite, creed, priesthood, or Scripture, though, of course, the religion of the Catholic mystic precludes this separation from externals.

In one or another of its forms, mysticism is a very ancient phenomenon, finding illustration in India both in Brahmanism and Buddhism, in Persia among the Sufis, and among the Greeks in Neo-Platonism. It passed over into Greek Christianity from Plotinus, through the writings of pseudo-Dionysius Areopagita (see **DIONYSIUS THE AREOPAGITE**), and his great commentator, Maximus Confessor (seventh century). John Scotus Erigena (ninth century) translated the pseudo-Dionysius into Latin, and thus introduced Greek mystical theology to Western Europe, where, superimposed upon the mysticism of Saint Augustine, it enjoyed increasing popularity. Monasticism proved a congenial soil for the cultivation of the mystic spirit, and some of its most perfect types are found among the monks, e.g. in the Eastern Church the Hesychastæ of Mount Athos (see **HESYCHASTS**), and in the Western,

Bernard of Clairvaux, Francis of Assisi, and Ignatius of Loyola. The Monastery of Saint Victor, near Paris, was a very influential centre of mysticism in the twelfth century. About the same time an Italian abbot, Joachim of Floris, prophesied that the dispensation of the Spirit would soon begin. Several famous mystics appear among the Schoolmen, some of whom were also members of monastic orders, e.g. Bonaventura, a disciple of the Victorines. Amalric of Bène, a Paris doctor (died 1207), pushed his mysticism to a pantheistic extreme.

Among the Dutch mystics are Ruysbroeck, author of several spiritual tracts (died 1381), Gerhardt Groot, founder of the Brethren of the Common Life (died 1384), and Thomas à Kempis, author of the *Imitation of Christ* (died 1471). Eckhardt (died c.1327) stands in the front rank of German mystics, and among his disciples were Tauler (died 1361) and Suso of Constance (died 1366). The *German Theology*, a popular book of devotion, was published by Luther in 1517. Jakob Böhme (died 1624) belongs to the Protestant school. Among more recent German mystics none perhaps is better known than Novalis, the disciple of Romanticism (died 1801). In England we find George Fox (died 1690). Among his contemporaries, the Cambridge Platonists (q.v.), especially Cudworth, More, and Smith, were both rationalistic and mystical; George Herbert (died 1633), Francis Quarles (died 1644), Henry Vaughan (died 1695), and later William Law (died 1761) were purely mystical. What is known as Quietism (q.v.) was a movement of the same nature with whose earlier stages Saint Francis of Sales, Bishop of Geneva (died 1622), had some sympathy, and which the Spaniard Molinos (died 1696), Fénelon (died 1715), and especially Madame Guyon (died 1717) made more definite. Not a few of the most gifted and honored among mystics have been women, e.g. Saint Hildegarde (died 1178), Elizabeth of Schönau (died 1164), Saint Catharine of Siena (died 1380), and Saint Theresa (died 1582).

Certain philosophical and scientific thinkers, including, for instance, Paracelsus, Giordano Bruno, Spinoza, Hegel, and Schelling, are less properly included among the mystics. But Immanuel Swedenborg (died 1772), eminent in applied science, but still more eminent for his religious allegorizing, deserves prominent mention.

Consult Preger, *Geschichte der deutschen Mystik* (Leipzig, 1874-1881); Vaughan, *Hours with the Mystics* (7th ed., London, 1895); Inge, *Christian Mysticism* (ib., 1899); James, *Varieties of Religious Experience* (London, 1902); Görres, *Die christliche Mystik* (Regensburg, 1836); Bigg, *The Christian Platonists of Alexandria* (London, 1886); id., *Neoplatonism* (ib., 1895). See the notices of the individuals mentioned in this article.

MYSTIC SHRINE, ANCIENT ARABIC ORDER OF NOBLES OF THE. An order asserted to have been founded at Mecca, Arabia, in the year of the Hegira 25. The modern order is of comparatively recent origin. The governing body in America is the Imperial Council, with eighty-five subordinate branches, called Temples. The order is not a Masonic body, but only Masons of the thirty-second degree of the Ancient and Accepted Scottish Rite, or Knights Templars in good standing, are eligible for admission. The membership in America amounts to about 68,000.

MYTH (Lat. *mythos*, from Gk. *μῦθος*, speech, legend). A form of folk-lore (q.v.) which sets forth as an historic tale the processes of nature, or beliefs concerning cosmogony (q.v.), religion (q.v.), custom (q.v.), tradition, and the like. The sum total of myths is the material for the science of mythology (q.v.), frequently termed comparative mythology. Within this many subdivisions may be set off, as the Greek myths concerning Diana (q.v.), the Teutonic Walhalla myths (see WALHALLA), the Polynesian water-myths, or the Hindu myths regarding caste (q.v.). Myth must be distinguished carefully from fable (q.v.) and from legend (q.v.). Thus we may have the fable of Zeus and the frogs, which points a moral teaching, or the legend of Saint Christopher (q.v.), which narrates a miraculous event, which may or may not have a moral bearing, but the Zeus-myth (see JUPITER) is based on belief in a sky-god, and is thus a part of nature-worship (q.v.).

MYTHICAL ISLANDS. Fabulous lands, with which popular lore or the imagination of poets and travelers have, since the earliest times, peopled various parts of the ocean. Among the Greeks, the Islands of the Blessed (q.v.), lying far in the western ocean, were the homes of those whom the divine favor saved from the pains of death to live in eternal bliss. Later, Plato placed in the same part of the world his lost Atlantis (q.v.). Celtic mythology presents a counterpart to the Islands of the Blessed in the fairy land of Avalon (q.v.), where Arthur was carried after his last battle. Of Celtic origin, too, is the mythical land of Saint Brendan (see BRENDAN, OR BRENNANN), lying off the western coast of Africa, in search of which expeditions set out as late as the beginning of the eighteenth century. To Christian refugees from the Iberian Peninsula, at the time of the Mohammedan invasion, legend ascribed the settlement of the long sought for Island of Seven Cities (q.v.). More within the realm of fact is Marco Polo's Cipango, identified by some with Japan. The Age of Discovery was fruitful of legendary lands, cities and islands. Best known among these last were the island of Bimini, in the region of the Bahamas, containing the fountain of youth, and the island of Brazil, which owed its name to its precious dyestuffs.

MYTHOLOGY (Lat. *mythologia*, from Gk. *μυθολογία*, from *μῦθος*, *mythos*, myth + *-λογία*, *-logia*, account, from *λέγω*, *legein*, to say). The science of myths, either a body of more or less doubtful stories, as when we speak of Greek or German mythology, or a rational account of how all such stories originate. Every race has its own myths, and in the first sense of the word a mythology has only to enumerate and classify the special stories of each race. The second application of the term, however, comprises various theories put forward to explain myths. Thus we come to what is now called the science of mythology, which deals with the origins of such myths or popular stories.

Myths may be divided into two sets of categories, arranged either according to the intellectual status of the original myth-makers or according to the subject-matter of the myth itself. Thus we may have myths of savages, as opposed to myths of cultivated races, and we may have myths of cosmogony, as opposed to myths of heroes. In many discussions of mythology it seems to be as-

sumed that the so-called 'savage myths' treated of the same subjects as do the 'higher myths,' only in a less cultivated manner; but this is an error. Hero-myths are sometimes called legends, to distinguish them from cosmogonic myths.

CLASSIFICATION OF MYTHS. The first important fact in mythology is that, however much we use the word mythology as if it were especially concerned with gods, the earliest mythology ignores the gods altogether. Now, if we examine the body of myths found among the most primitive people, we shall find that they are without exception concerned with the same subjects, and we may therefore draw the historical conclusion that mythology begins with the discussion of these subjects, whereas tales of gods and nature-myths are a later development. The two linked subjects thus forming the base of all mythology are the deeds of ancestors and cosmogonic explanation. It is customary to divide myths into historical and scientific, that is, myths of the past of man and myths to explain natural phenomena. But among the most primitive peoples the two sorts of myths become one. A vague tradition of the wanderings of a tribe is simply united with an explanation of a physical process, and thus the scientific myth is also historical. But there is one valid distinction to be kept in mind; that is, the distinction between such a scientific myth and a religious myth. Mythology has to do with religion only because religion is one of the many fields in which the art of telling stories has exercised itself. It does not follow, however, that a story in regard to the flood or to the way the world was made has any religious significance. The former example is a very good illustration of how the historical myth may become a religious myth. Thus in India the story of the deluge was told at first without any suggestion that the flood was a punishment of sin; later, however, it is interpreted as a 'washing out' of sin.

Another important principle in the classification of myths is the relativity of imagination in the myth-makers. This disposes of the rather crude demarcation into 'savage' and 'higher' myths. Thus the Polynesian and Melanesian mythology is almost as rich in stories of the gods as is that of Homer, but for all that the island-blacks are as savage as those of Africa, and their 'higher' mythology merely means that these savages are more imaginative than are the Mishmis and Kacharis of India, who have an active fear of devils, and a very vague idea of any other spiritual power except the ancestral ghost. An excellent illustration of mythology in its lowest stages is offered by the Central Australians. Here the whole burden of myths is concerned with the great deeds of the ancestors in the holy *Alcheringa* or 'time of old.' Of real gods there is only a Creator whose cosmogonic work is briefly described as 'cutting out the world.' The Creator made the world and the half-human ancestors of the tribes, but the mythology is concerned only with the latter. Gods, and especially tales of gods, come much later. If we may conclude that ancestor-deeds, and a somewhat adventitious and remote scientific explanation of the universe as formed by a superior being or as consisting of such a being's dis-membered parts (another popular savage myth), constitute the basis of mythology, we shall no less truly find that the doings of the

demons constitute the next stage. This phase of mythology is usually not developed beyond simple concrete performances. There is very little mysticism, and no system. A certain devil has had a difficulty with some member of the tribe and is either driven off or slays the man, who then becomes a devil in turn. A further stage is reached as the devil becomes more godlike, i.e. is no longer a mere mischief-maker, but a helper of man. This stage may be reached by savages, and it is characteristic of Polynesian mythology that, while mainly concerned with the doings of demons, it rises also to the conception of a kind-hearted demon, although this happens seldom.

At the stage when demons and not gods are the controlling spiritual agency, we find animal-myths in their crudest form, often, as in totemic tribes, being identical with ancestor-myths, but, again, without such identification. Thus, when the tribe is descended from an animal ancestor, or the ancestor has become an animal, the two sorts of myths merge; but myths about animals may be current without any notion of relationship between man and animal. The same is true in regard to myths about animated trees and mountains, etc. It is quite impossible to draw a sharp line between this stage and that where demons and animals and cult-heroes are elevated to the position of gods, and tales about them become part of theology.

In general we must distinguish between ancestor and cosmogonic myths, the myths of devils and of sprites, and the myths that collect about higher anthropopathic divinities. Again, not exactly cosmogonic, but historical, are the myths of floods and wanderings and of early settlements reflected in tales of hyperborean paradises. As the cosmogonic myths are early attempts to give not a religious, but a scientific or at least a logical explanation of the universe, so this class of myths may be called historical, and they may really reflect some pre-historical movement of races, though most of them are enwrapped in later fable. Thus myths of a deluge may in some cases rest on an actual flood, which as far as the tribe was concerned swept away the world. We cannot suppose, however, that any of these myths have come down to us in a pure condition. They are all accretions built up by successive generations. For this reason the higher mythology contains also the lower, though generally the more savage features in the latter have been softened down. Further, in the frequent amalgamation of tribes into a larger political unit myths often lose their original significance and are attached to quite different gods. Even without visible outward change the herogod becomes modified in spirit, according to the changing theology. Again, as tribes merge and distribute their myths, so myths by their own charm travel from land to land, the characters being changed. Myths in an advanced stage may become purely allegorical, as when a solar culture-hero is represented as destroying barbarism under the guise of a long anthropomorphic tale, such as the epic of the *Rāmāyana* in India. Again, in the process of anthropomorphizing, the hero may become so human as to suggest that he was a man, and we thus arrive at the Euhemeristic explanation of all myths as tales told about human beings afterwards elevated to divine rank. Thus, in India the 'mortal

gods,' or gods who had originally been men, are a recognized class, the most conspicuous member of the class being the local Cræsus called Kubera, who is usually regarded as king of the under-world wealth, a Pluto; but in this interpretation he is a god divinized out of a rich man named Kubera.

EXPLANATION OF MYTHS. The example just cited (and analogous cases) led to the notion that all myths were to be interpreted in this way, a view held by some rationalists in India, and favored in Greece by many thinkers, but first reduced to an 'atheistic' philosophy of mythology by Euhemerus in the fourth century B.C. In opposition to the older view that myths were to be interpreted allegorically, Euhemerus taught—whether seriously or not is now questioned by some scholars—that the gods were originally men, and that stories about men were transferred to gods, a method here and there countenanced by Plato. Herbert Spencer, who also believes that gods were at first the ghosts of men, has adopted the Euhemeristic explanation in its crudest form. He believes, for example, that there was once a girl called Dawn, and that when she died the Vedic Aryans sang to her ghost the Vedic 'hymns to Dawn'—a view consonant neither with the content of the hymns nor with the practices of the poets. At present, if we pass by Spencer's theory with the brief criticism it deserves, there are two accepted schools of interpretation. The older view is that of Max Müller. In its whole form it is quite as unhistorical as Spencer's, but it contains a truth ignored by the opposing school. Müller held that myths were nature-poetry, and that many of them in an advanced stage of evolution could be explained by what he called 'disease of language,' that is, mythology is the result of the misunderstanding, on the part of a whole people, of their inherited phraseology. Where an old poet referred to sunrise as 'the shining one' (feminine) being followed by 'the bright one' (masculine), his descendants interpreted the grammatical sex as implying sex in person and his phrase meant to them 'the (male god) Bright (sun) courts Miss Dawn,' and so, on the strength of countless errors of this sort, arose mythology, which can be analyzed into its component parts by comparing the names of gods in one language with cognate words in related languages. Müller's error lies in a too sweeping application of this theory, in his lack of appreciation of other causes leading to mythology, and in the weakness of his etymologies. But there is truth in the dictum that a misapprehension makes gods. A Vedic poet sings, "Who is the god whom we should revere?" and his sublime word is interpreted by a later generation as meaning "there is a god called Who, and we should make sacrifice to Who." Then later writers go still further and enjoin upon the priests to make two sets of offerings, one to Who and one to Whom, as distinct deities. The folk-lore explanation, which has obtained since Mannhardt and Tylor and is steadily gaining ground, rejects both Euhemerism and language-disease as factors of mythology, and seeks the explanation of the higher myth in the original conception of the lower. Kronos's brutality and *Little Red Riding Hood* are both stories popular in their day and paralleled by many like stories among savage nations to-day. Such tales are retained, toned down, symbolically explained, but in origin they belong to the tales

that please savages. There is no doubt that such is the state of the case, and that *Red Riding Hood* is not a sun-myth (exposed to disease of language), but a tale that pleasantly affected peasants. The folk-lore explanation runs to accumulation of tales, however, without a radical explanation, and it ignores too much what is true in Spencer's mythology, that many tales are simply ghost-stories. Nor can it be said that the folk-lore method is successful in explaining all myths. It is an error to suppose that all myths are psychical reflections of physical or of meteorological phenomena, for much must be attributed, even among savages, to poetical fancy. But what Mannhardt has himself called 'nature-poetry' and illustrated by modern examples among the Slavs shows that personalities originally solar are sometimes transferred to poetical representatives explicable only in a solar light. The true explanation of mythology will combine the hitherto antagonistic explanations of Lang and Müller, and will also admit that Spencer's theory of ghost-mythology is at times applicable. No stereotyped formula can include all the phenomena. In the last analysis will be found folk-lore, language-change, and ghost-stories. All three principles are active to-day in India, and probably have always been active among all peoples in proportion to their imaginative powers. The fourth element of poetic fancy affects all the other three. Much that is looked upon as elaborated mythology is nothing but a naïve statement of what appears to the savage as everyday facts, such as the birth of men from beasts or from the elements, the birth of animals from women, metempsychosis, the intimate relations between man and all natural objects.

MYTHOLOGY IN ART. That portion of art which is concerned with the representation of mythological concepts. Religious notions are symbolized at a very early stage in the history of mankind. Conceptions which can be given in vague and poetic terms in the literature, must of necessity in art be represented concretely. The first beginnings are rude and uncouth; yet they develop in the course of time into the most beautiful of all expressions of national art. They are thus important not only from the point of view of history of art, but as one of the main sources for an accurate knowledge of the history of religion. We may trace in them also in many cases the influence which one religion has exercised upon another. If, for instance, we find the bearded figure within a circle as the Iranian symbol of Ormazd, and in Assyrian sculpture see the same figure hovering over a field of battle, it is at once evident that the religious art of Assyria has influenced that of ancient Persia, and the implication follows that the actual concept of the deity of Ormazd has been modified by a Semitic deity.

Nowhere are the distinct national characteristics of mythology so clearly set forth as in art. In the Egyptian paintings and statues of deities, we have the stiff outlines and the grotesque animal-headed figures, which stand in marked contrast to the brutal and massive religious art of Assyria and Babylonia. From the point of view of comparative religion the most perfect productions of art are as a rule inferior to the rude and archaic. It might almost be laid down as a rule that the higher the artistic merit, the less the purely religious value. The most important contributions of Assyrian art to a knowledge of its mythology are to be found not in the finished productions of the late period, but in the more ancient seal-cylinders, whose purely artistic merit is often slight. In Greece, in like manner, the early religious art is rude, but here we find in the most archaic periods traces of influence from Egypt, or again, as in certain pictures of the struggle of Hercules with the Nemean lion, an analogue too close to be accidental with Babylonian pictures of the Gilgamesh cycle. Though the highest religious sentiments of a people at a given period are embodied in its art, the endeavor to make this embodiment perfect tends in the course of time to an increased purity in the type and symbolization of religious concept. This interacting process is stimulated by the fact that the statue or the painting is conceived to be in itself divine, and at later period a portion of godhood; later still it is a symbol which may indeed be a god to the vulgar, but to the cultured or to the initiated is but a representation of divinity. Artistic conceptions of divinities naturally vary, according to the character of the god represented. Thus in ancient Mexico we find beside the figure of the beneficent Quetzacoatl the horrible statue of the wargod Huitzilopochtli, on whose altar human sacrifices were offered. If the religious art of Mexico is rugged, that of India is effeminate. In India again, in harmony with the grotesque religious legends, we find strange divine figures. The monkey-god Hanuman, in harmony with his energetic character, has no touch of the effeminate about him, as has the love-god Kama, and in like manner we find the voluptuous figure of Parvati, the wife of Siva, in her kindly aspect, beside the frightful and demoniac figure of Durga,

the malignant form of the same goddess. In Greece, where mythology in art was developed to its utmost perfection, we find this principle carried out in its entirety. Beside the austere Athene stands the seductive Aphrodite; with the powerful Hercules is contrasted the delicate, almost too beautiful Apollo, and over all the Pantheon towers the majestic figure of Zeus. See ART, HISTORY OF; and the various articles on NATIONAL ART as well as the plates of EGYPTIAN DEITIES; HINDU DEITIES under INDIA; GREEK ART; JUPITER; LYSIPPUS; PARTHENON.

MYTILENE, mit'ī-lē'nā (Lat., from Gk. Μυτιλήνη, Turk. *Midilli*), or MITYLENE. The largest island in the Ægean Sea, also known as Lesbos (q.v.).

MYTILENE, or MITYLENE (modern Kastro, q.v., or Mitilini). The capital of the island of Lesbos (q.v.). It was colonized in very ancient times by the Æolians. Its situation on the southeast coast of Lesbos on a promontory that had been an island gave it two excellent harbors (Map: Turkey in Europe, F 5). Of its internal political history down to the time when Pittacus became practically dictator early in the sixth century B.C., something is to be learned from the fragments of the poetry of Alcæus (q.v.). Meanwhile the city had become the most important centre of the Asiatic Æolians and a great naval power, and had founded colonies in Mysia and in Thrace. After the Persian wars it became an important member of the Athenian Confederacy, but in B.C. 428, the fourth year of the Peloponnesian War, it rebelled against Athenian domination. Defeat after a famous struggle ended its power (B.C. 427). Mytilene fought on the side of King Mithridates in his war against Rome (B.C. 88), and after his defeat suffered for it. Consult: Leithäuser, *Der Abfall Mytilenes von Athens* (Leipzig, 1874); Cichorius, *Rom und Mytilene* (ib., 1888).

MYTILUS. See MUSSEL.

MYXINE (from Gk. μύξα, *myxa*, mucus). The single genus of the family Myxinidæ, represented by the single species *Myxine glutinosa*, the hagfish or 'borer' of the North Atlantic Coast. These eel-shaped parasitic animals, which burrow into the bodies of fishes, are extraordinary in their reproductive habits. According to Nansen, Myxine is generally or always in its young stage a male, while at a more advanced stage it becomes transformed into a female. The ovary is single, and on the right side, and there are no oviducts, the mature eggs falling into the abdominal cavity and being extruded through the peritoneal opening at the side of the vent. The eggs are few and large, and each is inclosed in an oblong horny case, with threads at each end, by which the egg adheres to some fixed object until it hatches. See HAGFISH.

EGG OF MYXINE.

MYXCEDEMA (Neo-Lat. nom. pl. from *μύξα*, *myxa*, mucus + *oedema*, *oîdēma*, swelling). A progressive disease characterized by widespread changes in nutrition and by the invasion of the subcutaneous tissues by solid edema, due to diminished functional activity of the thyroid gland. It has been called *cachexie pachydermique* (Char-

cot), *cachexia thyroidea* (Kocher), and *hydro-paresis* (Féris). Myxœdema is caused by destruction of the tissue of the thyroid gland by disease, or as a result of removal of it by operation. It occurs principally in women, and is in fact an acquired cretinism in adult life. By far the greater number of cases occur between the ages of thirty-five and forty-five. In some families there is a distinct inheritance of a predisposition to disease of the thyroid gland. The disease occurs most frequently in cold climates, and is perhaps most frequent in Europe. The symptoms of the disease develop gradually, in most cases nearly a year elapsing before the disease becomes distinct. Among the principal symptoms are languor; sensibility to cold; absence of perspiration; loss of hair; decay of nails and teeth; pallor; subnormal temperature; hallucinations of sight and hearing, and even actual insanity; anæmia; indigestion; and enlargement of lymphatic glands. The treatment is to feed the patient with thyroid gland extract or dry thyroid, together with tonics, such as phosphoric acid and iron. Thyroid grafting has proved efficacious in many cases. The partial or entire thyroid of an animal is transplanted into the peritoneal cavity or into the subcutaneous tissue of the patient, to whom thyroid has been administered for a considerable time previously to the grafting, as suggested by Victor Horsley. Treatment by the administration of thyroid extract has been largely employed since it was first used in 1891 by Murray of England. The extract is made by macerating sheep's thyroids in glycerine. It must be administered with great care, degeneration of the heart or of the great vessels being an indication for very small initial dosage. In some patients profuse diarrhœa results, in others vomiting, sweating, headache, swelling of the glands about the jaw, and prostration. The remedy may be used hypodermically. After the symptoms of the disease have disappeared, the patient must take a small quantity of the thyroid extract at regular intervals as long as she lives, to maintain the improved condition. See CRETINISM. Consult: Gull, "On a Cretinoid State Supervening in Adult Life in Women," in *Clinical Society's Transactions* (London, 1874); Murray, in *British Medical Journal* (London, 1891); Virchow, in *Berliner klinische Wochenschrift* (1887); Horsley, in *Brown Lectures* (London, 1884); Osler, in *American Journal of the Medical Sciences* (Philadelphia, 1893); Gimlette, *Myxœdema and the Thyroid Gland* (London, 1895).

MYXOMYCETES, mīk'sō-mī-sē'tēz (Neo-Lat. nom. pl., from Gk. *μύξα*, *myxa*, mucus + *μύκης*, *mykēs*, fungus). A group of organisms commonly called slime molds. Certain phases of their life history are very animal-like, but the final fructification has many plant characteristics, and as the forms are described and classified by the fructification the work has naturally fallen within the province of botany. They are here treated as one of the great groups of the fungi (q.v.). The purpose of the fructification is the production of multitudes of very minute spores. The spores germinate in moist situations on the soil and in humus, giving rise each to a motile protoplasmic body provided with a cilium (Figs. 6, 7, 8). These swarm cells swim around in the moisture, increasing in number by division (fission). After an active period they become more quiet and creep around

like amœbæ (Figs. 1, 2, 3), finally approaching one another and fusing in pairs, or perhaps several together. Such fused groups become centres of attraction to many hundreds of swarmers, which contribute their substances to the common mass. The result is a large protoplasmic body, called a plasmodium (Fig. 9), which moves over the surface of the humus and into crevices like a gigantic amœba. Its food is largely bacteria and other fungi, which are taken directly into the protoplasmic body and digested, the hard and worthless portions being discarded.

Vegetating plasmodia shun the light and seek moisture. But these habits are reversed when the fructification is to be formed; the plasmodia then come to the light and take position in the driest situations that they can find. This is the time when plasmodia are most conspicuous and are frequently found on stumps, bark, and humus. The largest plasmodia may cover several square inches, but most of them are much smaller, and some are no larger than a pin-head.

MYXOMYCETES.

Chondriodermis: 1, 2, 3, amœboid stage; 4, 5, resting stage; 6, 7, 8, motile stage; 9, plasmodium steinonites; 10, sporangia.

The form of the fructifications is exceedingly various, some being large and irregular, and others with an extraordinary delicacy and complexity of structure, but the general history of spore formation is much the same. The plasmodium excretes a great deal of material (and frequently mineral matter) which forms the wall of the spore-case (sporangium) and its stalk if present (Fig. 10). A filamentous network called the capillitium may also be developed inside the spore-case, its function being to distribute the spores. The protoplasm which remains after these activities divides up into minute rounded bodies which, investing themselves with walls, become the spores. The plasmodia of slime molds have been favorite subjects of observation by physiologists, who find here the largest masses of protoplasm that can be studied.

For a general account consult: Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887); and for special descriptive treatment, Lister, *A Monograph of the Mycetozoa* (London, 1894); McBride, *The North American Slime Moulds* (New York, 1899).

MYZONTES, mī-zōn'tēz. Same as *Cyclostomi* (q.v.).

N

N The fourteenth letter and eleventh consonant of the Roman alphabet. This character has varied very little in form and not at all in value since the origin of the alphabet. The original letter was apparently called *nun*, which in Phœnician and in the North Semitic languages signified 'fish.' Apparently the early pictographic character represented a fish. See ALPHABET.

PHONETIC CHARACTER. *N* stands for the dental or alveolar nasal sound which is the equivalent to *d* and *t*. The sound is produced by a check or mute contact and sonant vibration of the vocal cords as in *d* with the addition of the opening of the nasal passage made by lowering the soft palate. The size and shape of the resonance-chamber make the difference between *n* and the other nasal letters. Under certain conditions *n* may have a syllabic or vocalic value, as in *rotten*, *forgotten*. In scientific linguistics this value is represented by *ṇ*. It is sometimes silent after *m* or *l* in the same syllable as in *damn*, *hymn*, *autumn*, *kiln*. Before *g*, *k*, *ch* it receives a semi-guttural or palatal coloring to harmonize with the consonant it precedes, as in *long*, *think*, *pinch*.

SOURCE. In its historic development *n* represents an original *n* which has been preserved with great constancy through the Indo-Germanic period to the present time. Thus *night*, Gothic *nahts*, Skt. *nakti*, Lat. *nox*; or again Idg. **nevos*, 'new,' Skt. *navas*, Gk. *neōs*, Lat. *novos*, Goth. *niujis*, Ger. *neu*, Eng. *new*. In Anglo-Saxon an original Germanic *n* disappears before *s*, *f*, and *p*.

AS A SYMBOL. As a numeral *N* = 90 and *N* = 90,000. In chemistry *N* = nitrogen; *Na* = sodium (i.e. *natrum*).

NABA, nū'bā. A seaport of Japan. See NAFA.

NABAB, nā'bāb', LE (Fr., the Nabob). A story by Alphonse Daudet (1877), based on the career of a contemporary adventurer. Its characters are in large part actual persons thinly disguised.

NABATÆANS (Gk. Ναβαταῖοι, *Nabataioi*, Ar. *Nabaṭu*). An Arab people or tribe settled in various parts of the country east and southeast of Palestine, who formed during the Græco-Roman period a petty independent kingdom. Their history is known to us from classical authors, especially Diodorus and Josephus, as well as from numerous coins, and from inscriptions, dating

from the year B.C. 169 to A.D. 105, which have been collected by De Vogüé (1868), Doughty (1884), Huber (1884), and Euting (1885). They are located at various places from the Hauran in the North to Madain Salah (Al-Hijr in Northern Arabia) in the South. The Arabic character of the Nabatæans is evinced by their proper names, though they used a Western Aramaic language and script, as the Northern Arabic had not yet been reduced to writing. It is uncertain whether they are to be connected with the Nabaioth, an Arabic tribe mentioned together with Kedar as a son of Ishmael (Gen. xxv. 13; xxviii. 9; xxxvi. 3; I. Chron. i. 29; Is. lx. 7) and several times referred to as *Nabaiati* in the Assyrian inscriptions of Tiglath-pileser, Sargon, and Assurbanipal. The Nabatæans are first met with about 312 B.C. at Petra as nomads, but so strongly intrenched here that both the generals sent against them by Antigonos, Athenæus and Demetrius, were unable to dislodge them. The Nabatæan kingdom arose in ancient Edom upon the ruins of the Seleucid and Ptolemaic empires. Its first prince was Aretas I., to whom the high priest Jason fled in B.C. 169. Its first king was probably Erotimus (Taim-Allat, B.C. 110-100). Obedas I. (B.C. 90) was able to hold his own against Alexander Jannæus, and Aretas III. (Philellenos) against Antiochus XII. of Cœle-Syria. The latter even conquered Damascus, but was driven out by the general of Pompey. Antony presented part of the land of the Nabatæans to Cleopatra. When Malchus I. (B.C. 50-28) refused to pay tribute, his land was overrun by Herod. War broke out between Herod and Aretas IV. (A.D. 9-40), in which the Nabatæans were successful. When Paul was in Damascus, that city must have been once again in the power of the Nabatæans (II. Cor. xi. 32). At the time of the Emperor Claudius, King Abias undertook an expedition against Adiabene, but he was beaten back. Damascus was lost to Nero in the reign of Malchus II. (48-71). The last King of the Nabatæans was Rabel II. (71-106). In 106 Cornelius Palma, Governor of Syria, made the region from Petra in the South to Bostra in the North into a Roman province. In the fourth century two provinces were created: Arabia with Bostra as a centre, and Palæstina Tertia with Petra as centre. The latest inscriptions in Nabatæan characters are those of Al-Namarah (328), Zebed (512), and Harran (568); but the language is purely Arabic. Later Arabic writers use the word Nabatæan as the equivalent of Ara-

mean. The importance of the Nabatæans is due to the fact that they formed a sort of buffer State against the Arabs of the desert and because their country lay in the direct line of the caravan route from Arabia to Syria. Al-Hijr was an emporium for the products of Yemen; and many mausoleums built in the rocks and beautifully carved are evidence of the riches which were concentrated here. The national temple was also situated at this place. The chief gods of the Nabatæan Pantheon seem to have been Dushares (*Dhu al-Shara*), Manat, Kais, Allat, and Hobal. Consult: Euting, *Nabatäische Inschriften aus Arabien* (Berlin, 1885); Schürer, *Geschichte des jüdischen Volkes*, vol. i. (Leipzig, 1886-90).

NABAYUGAN, nā'bā-yōō'gān. A head-hunting Malay tribe in Cagayan Province, Luzon. See PHILIPPINE ISLANDS.

NABNES, nābz, THOMAS (1605-?). An English dramatist, born in Worcestershire. His first comedy, *Covent Garden*, was produced in London in 1632-33. His second attempt, *Tottenham Court* (1633), was followed by *Hannibal and Scipio: An Historical Tragedy* (1635), and a comedy called *The Bride* (1638); but more talent was displayed in his masques, such as *Spring's Glory* (1638). An edition of his works was published by Bullen (London, 1887; *Old English Plays*, new ser., vols. i. and ii.).

NABHA, nā'bā. An eastern native State of the Punjab, India (Map: India, C 2). Area, 936 square miles. Population, in 1891, 282,756; in 1901, 297,949. Capital, Nabha.

NA'BOB, or **NA'BAB** (Hind., Ar. *nawāb*, deputy, from Ar. *nāba*, to replace, to be a deputy). Under the Mogul Empire of India, the administrator of a province comprised in the region ruled by a *subahdar* or viceroy. The title was continued under the British rule, but gradually was applied to unofficial wealthy natives. In the United Kingdom and other European countries it is applied derisively to Euro-Indians who, having amassed fortunes in India, return to make an ostentatious display of their wealth.

NA'BONAS'SAR (Ass. *Nabu-nasir*, Nabu (or Nebo) protects). King of Babylonia (B.C. 747-734). His contemporary in Assyria, Tiglath-pileser III. (B.C. 745-727), succeeded with the help of the Aramæan hordes that at all times were a menace to Babylonian security in obtaining complete control of Babylonia, and emphasized his success by giving himself in his inscriptions the title of King of Sumer and Accad (i.e. Southern and Northern Babylonia), and by worshiping at the shrines of the Babylonian gods in the most important cities of the south: Sippar, Nippur, Babylon, Borsippa, Cuthah, Kish, Dilbat, and Erech. It is evident, therefore, that Nabonassar must have been merely a vassal to Tiglath-pileser III., but a semblance of independence was permitted to Babylonia because of a desire on the part of the Assyrian rulers to deal leniently with the old empire in the south for fear of incurring the displeasure of the Babylonian gods who were also the gods of Assyria. The history of Babylonia, therefore, in Nabonassar's reign is merely a part of Assyrian history. His name is preserved in the Ptolemaic canon, whose list of Babylonian kings begins indeed with Nabonassar. Why the beginning should have been made with this ruler is not

clear. There is nothing to warrant the supposition that the Babylonians began a new era—historical or astronomical—at the time of Nabonassar, though that date was adopted as a new astronomical era by the Greeks. Equally mysterious is Berosus's statement, preserved by Syncellus, that Nabonassar first collected and then destroyed the chronicles of his predecessors. Consult Rogers, *History of Babylonia and Assyria*, vol. ii. (New York, 1900); and for the reign of Tiglath-pileser, Rost, *Keilschrifttexte Tiglat-Pileasers III.* (Leipzig, 1893).

NABONIDUS (Ass. *Nabu-na'id*, Nabu (or Nebo) is exalted; Herodotus (i. 74, 77, 188) has erroneously *Λαβόννος, Labynētos*). The last King of the Neo-Babylonian Empire, sixth in order of succession from Nabopolassar (q.v.), the founder of this empire. He came to the throne in B.C. 555 as a result of a conspiracy formed apparently by the priests of the city of Babylon against Labosoarchod (Ass. *Labashi-Marduk*), the grandson of Nebuchadnezzar (through the female line), which cost Labosoarchod his life. Nabonidus was a native Babylonian and not, as his predecessors since Nabopolassar, a Chaldean. In his inscriptions, of which a large number have been found, he appears chiefly in the light of a builder and restorer of the sacred edifices in such ancient centres as Ur, Harran, and Sippar. While he did not neglect the sanctuaries of Marduk and Nebo at Babylon and Borsippa, yet his greater devotion to other centres appears to have aroused the opposition of the priests and of the population of Babylon, and the neglect of suitable preparation to resist the threatening advance of Cyrus (q.v.), the leader of the Medes, is probably to be ascribed to internal dissensions. It would appear that Nabonidus was not even present in the city of Babylon when in the summer of 538 the Persian army marched upon the capital. His son Belshazzar (Ass. *Bel-shar-usur*, Bel, protect the King) had been placed in control, while the father's official residence was at a place called Tema, the exact location of which is not known. Babylon fell, as a Babylonian chronicle puts it, 'without battle,' and in the autumn Cyrus himself entered the city in triumph and became heir to the glorious past of Mesopotamia and the Euphrates Valley. Belshazzar was put to death, while Nabonidus was banished to Karmania. Consult: Rogers, *History of Babylonia and Assyria* (New York, 1900); and the Babylonian-Assyrian histories of Tiele (Gotha, 1886), Hommel (Berlin, 1885), and Winckler (Leipzig, 1892).

NAB'OPOLAS'SAR (Ass. *Nabu-apal-usur*, Nebo, protect the son). The founder of the Neo-Babylonian Empire, King of Babylonia B.C. 625-605. He was not of royal birth, as is indicated by the absence of any reference to his father in the inscriptions that we have of him. By his own efforts he rose to a position of supremacy over the district of Chaldæa lying to the south of Babylonia proper as far as the Persian Gulf, which had managed even during the height of the Babylonian Empire to retain a certain measure of independence, and whose separate position continued to be recognized by the Assyrian kings when Babylonia had come under the control of Assyria. At various times the Chaldæans made attempts to regain their independence, and the growing weakness of Assyria after the death of

Assurbanipal in B.C. 626 furnished the desired opportunity for the Chaldeans to reassert themselves and to extend their control from Chaldæa to Babylonia. About B.C. 607 Nabopolassar, with the aid of the Medes and the northern invaders indefinitely known as the Scythians, brought about the fall of Nineveh and the destruction of the Assyrian realm. The Neo-Babylonian Empire now became the controlling influence in Mesopotamia and the Euphrates Valley. The few inscriptions of Nabopolassar which have been found show him to have been a man of force and energy, who managed not only to maintain his position against great odds, but to hand over to his son, Nebuchadnezzar, an empire almost as extensive and as powerful as was that of Assyria in her best days. He improved and enlarged the famous temple of Marduk in Babylon, and the sanctuaries of Shamash, the sun-god, and of Belit at Sippar, and constructed a canal at the latter place to bring the waters of the Euphrates to the city walls. The Chaldæan origin of the Neo-Babylonian Empire led to the use of the term Chaldæa among classical writers for Babylonia. Consult: Rogers, *History of Babylonia and Assyria* (New York, 1900), and the Babylonian-Assyrian histories of Tiele (Gotha, 1886), Hommel (Berlin, 1885), and Winckler (Leipzig, 1892).

NABOTH. The owner of a parcel of land, described as a 'vineyard,' in Jezreel, adjoining the palace of Ahab, King of Israel. When the latter proposed to buy the land, Naboth refused to sell (I. Kings xxi. 1-14). Thereupon the Queen, Jezebel, had Naboth put to death by the elders of his city on a false accusation of treason against God and the King, and the King took possession of the land. The crime was denounced by Elijah, and the downfall of the house of Ahab and the barbarous murder of Jezebel were regarded as its just punishment (I. Kings xxi.; II. Kings ix. 21-30). The story is interesting for the hints it gives as to local customs and popular ideas in Israel in the ninth century B.C. See **AHAB**; **JEZEBEL**.

NABU, nā'bōō. See **NEBO**, **MOUNT**.

NABUA, nā'bōō-ā. A town of Southern Luzon, Philippines, in the Province of Camarines. It is situated in a low, marshy region occupied by rice-fields, about 20 miles southeast of Nueva Caceres (Map: Philippine Islands, H 6). Population, in 1896, 17,789.

NABULUS, nā'bū-lōōs', or **NABLUS**. One of the chief cities of modern Palestine, the ancient Shechem (q.v.). It is situated about 35 miles north of Jerusalem, in a well-watered and productive valley, between the mountains Jebel esh-She-mali (Ebal) on the north and Jebel et-Tor (Gerizim) on the south. It is the seat of government for central Palestine and the corresponding region beyond the Jordan, the residence of a Greek bishop, has several mosques and Mohammedan schools, and English and Latin mission establishments. It has considerable industries, especially the manufacture of soap, and carries on a lively trade with the east-Jordan country and Jaffa. It has about 24,000 inhabitants, including the surviving remnant of the Samaritans, who occupy the southwest part of the town. See **SAMARITANS**.

NA'CHI. See **NATCHEZ**.

NACHTIGAL, nāg'tā-gāl, **GUSTAV** (1834-85). A German explorer, born at Eichstedt, near

Stendal. He studied medicine, practiced as a military physician in Cologne, and in 1863 went to Algiers, and then became a physician in the service of the Bey of Tunis. In 1869 he joined a caravan which was dispatched to carry from the King of Prussia to the Sultan of Bornu some gifts in recognition of the latter's services to various German explorers. After a journey in the Tibbu country he set out for Kuka, the capital of Bornu, where he arrived in 1870. He made a thorough exploration of Bornu; then went to Lake Chad. Making his way to Bagirmi, he followed up the Shari River and its tributaries. In the spring of 1874 he set out for Egypt, going through Wadai, which he was the first European to penetrate. He visited Abeshr, the capital of Wadai, passed through Darfur and arrived at Cairo in November, 1874. In 1875 he returned to Europe, where his explorations had made him famous. In 1884 he visited the west coast of Africa, where his explorations resulted in the acquisition by Germany of the important colonies of Togoland, Kamerun, and Lüderitzland. Before finishing his labors, however, he was taken sick and died. His greatest work, *Sahara und Sudan*, was published in 1879-89. Consult Ruhle, *Gustav Nachtigal* (Münster, 1892).

NACOGDOCHES, nā'kō-dō'chēz. A city and the county-seat of Nacogdoches County, Texas, 138 miles north by east of Houston: on the Houston, East and West Texas and the Texas and New Orleans railroads (Map: Texas, G 4). It has lumber mills, cotton gins, cotton compress, cottonseed oil mill, brick plants, etc.; and, as the commercial centre of a productive cotton-growing and farming section, controls wholesale interests of importance, and a trade in cotton, produce, hides, and lumber. Population, in 1890, 1138; in 1900, 1827. Nacogdoches owes its origin to a Spanish mission, established here early in the eighteenth century. As an outpost against American encroachment it played a part in the controversy between Spain and the United States over the Spanish possessions in the Southwest. It was captured in 1812 by an American filibustering party under Magee and Gutierrez.

NADAL', **EHRMAN SYME** (1843-). An American author, born at Lewisburg, W. Va. He graduated at Yale in 1864, was second secretary of the United States Legation at London in 1870-71 and 1877-83, and after 1884 was for several years a member of the staff of the New York *Nation*. His publications include *Impressions of London Social Life* (1875); *Essays at Home and Elsewhere* (1882); and *Zwiebak: Notes of a Professional Exile* (1895). He also contributed in similar vein to reviews and other periodicals.

NADAUD, nā'dō', **GUSTAVE** (1820-93). A French song-writer, born at Roubaix (Nord). He was educated for commercial life, but the success of some of his songs decided him to take up song-writing as a profession. Collections of his compositions appeared in 1849, 1852, 1862, 1870, 1879-80, and 1882, and many of the songs became popular. He also wrote three operettas, *Une idylle* (1861), a novel, and *Solfège poétique et musical* (1886), *Miettes poétiques* (1888), and *Nouvelles chansons à dire ou à chanter* (1889).

NADEN, **CONSTANCE CAROLINE WOODHILL** (1858-80). An English poet, born at Edgbs-

ton, Birmingham, January 24, 1858. She attended classes in science at the Birmingham and Midland Institute and at Mason College, and became a close student of Herbert Spencer, on whose philosophy she frequently gave lectures. She died December 23, 1889. Miss Naden published two volumes of poems: *Songs and Sonnets of Springtide* (1881), and *A Modern Apostle and Other Poems* (1887); containing pieces, as "The Pantheist's Song of Immortality," that give her an assured place among the lesser poets. Consult the *Memoir* by W. R. Hughes and others (London, 1891); *Induction and Deduction*, a prize essay, ed. by Lewins (ib., 1890); and *Complete Poetical Works*, ed. by Lewins (ib., 1894).

NADIR (Ar. *naẓir*, similar, corresponding (i.e., to the zenith), from *nazara*, to behold, to be face to face). That point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and centre of the earth are in one straight line. The zenith and nadir are 90° distant from every part of the horizon (q.v.). See **ZENITH**; **MERIDIAN CIRCLE**.

NADIR SHAH, ná-dēr shā (1688-1747). A King of Persia. He belonged to the Afshars, a Turkish tribe. He was born near Kelat, in the centre of the Persian province of Khorasan. At the age of seventeen he was taken prisoner by the Usbek Tatars, but, escaping after four years of captivity, he entered the service of the Governor of Khorasan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offense, he became an outlaw and for several years was the leader of a band of 3000 robbers. At this period the Persian throne was occupied by a usurper, Mir Vaiz, of the Afghan tribe of Ghilzai, who were bitterly hated by the Persians for cruelty and oppression. In favor of the rightful heir, Tahmasp II., Nadir took up arms against Malik Ashraf, the successor of Vaiz, and in token of his loyalty assumed the name of Tahmasp Kuli, or Slave of Tahmasp. Defeating the usurper in a series of engagements, he freed the provinces of Irak, Fars, and Kirman of even the semblance of Afghan domination. The assassination of Ashraf during his retreat terminated the war. Tahmasp then ascended the throne, and Nadir received for his services the government of the provinces of Khorasan, Mazandaran, Seistan, and Kirman. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which they had seized in the preceding reign. Meanwhile Tahmasp himself had been unsuccessful in his operations against the Turks. Nadir took this as a pretext to imprison the Shah, whose infant son, Abbas II., he placed on the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of Nadir himself, who was crowned as Nadir Shah, February 26, 1736. To win the support of the Afghans, the new ruler declared the Sunnite form of Mohammedanism to be the State religion instead of the Shiite, which has always been favored by the Persians. Nadir resumed the war with the Turks, and, though totally defeated in the first two battles by the Grand Vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also con-

quered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered together with his suite at Jelalabad, and satisfaction having been refused, Nadir, in revenge, ravaged the North-west Provinces and took Delhi, the capital of the Great Mogul, which was pillaged against his will (1739). With booty to the amount of four hundred million dollars, including the Koh-i-nur (q.v.) diamond and the famous peacock throne, he returned to the west bank of the Indus. He next reduced Bokhara and Khwarezm, restoring to Persia her limits under the Sassanids, and formed plans, which were never realized, for making Persia a maritime power. Embittered by an attempt to assassinate him in 1741, of prompting which he suspected the heir apparent, Rizakuli, whom he blinded and imprisoned, Nadir's character underwent a sudden change. Formerly open-hearted, liberal, and talented, he became suspicious, avaricious, and tyrannical. He was assassinated on June 20, 1747, and was succeeded by his nephew, Ali, who ascended the throne as Adil Shah, or the 'righteous king,' but was deposed within a year. Consult Maynard, *Nadir Shah* (Oxford, 1885).

NADLER, nü'dlēr, KARL CHRISTIAN GOTTFRIED (1809-49). A German poet, who wrote in the dialect of the Rhenish Palatinate. He was born at Heidelberg, and studied there and at Berlin. His poems, under the title *Fröhlich Palz, Gott erhalte* (1847; 8th edition, 1882), were excellent pieces of genre verse, the drinking songs being peculiarly rollicking and musical.

NADSON, nāt'són, SEMYON YAKOVLEVITCH (1862-87). A Russian lyric poet, born in Saint Petersburg, of Jewish extraction on his father's side. In 1878 he published his first poem, *At Dawn*. Shortly after he entered the army, but soon left it because of poor health. His volume of poems was bequeathed to the *Literary Fund*, which had advanced him a loan to go abroad. Its sale—over 50,000 copies—was unprecedented. It is now in the fourteenth edition, and a special *Nadson Fund* of 50,000 rubles has accumulated. His poetry charms by the soft melancholy of a youthful dreamer who is a prey to physical suffering.

NÆVIUS, GNÆUS. One of the earliest Latin poets, probably born in Campania, in the first half of the third century B.C. In his youth he served in the First Punic War, but later made his appearance at Rome as a dramatic writer. He was very decidedly attached to the plebeian party, and in his plays satirized and lampooned the Roman nobles with extreme virulence. His rashness ultimately caused his banishment to Utica in Africa, where he died about B.C. 200. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian metre. Of the plays only a few very unimportant fragments are extant, which may be found in Bothe's *Poetarum Latinorum Scenicarum Fragmenta* (Halberstadt, 1824); Klussmann's collection of the same (Jena, 1843); Müller's *Livii Andronici et Cn. Nævi Fabularum Reliquiæ* (Berlin, 1885); or Ribbeck's *Scanica Romanorum Poesis Fragmenta* (Leipzig, 1897-98). See also Sellar's *Roman Poets of the Republic* (Oxford, 1881).

NÆVUS (Lat., mole, wart, birth-mark), or **BIRTH-MARK**, **MOTHER'S MARK**. A congenital mark upon the skin consisting of the product of excessive development of fibrous tissue, hair, blood-vessels, or pigment in a circumscribed area. The term is generally and perhaps more properly limited to a variety of angioma, or vascular tumor, usually of small size, composed of enlarged capillaries which communicate freely with other capillaries of the skin. The ordinary form of nævus is the *vasculosus*. This is present at birth or appears during the early months of the child's life, presenting itself as a red stain, or a diffuse flat patch, somewhat elevated above the surrounding surface. It may be a punctate spot, or may cover the side of the face, or even the neck and chest, for example. This variety is called 'port-wine mark,' 'wine stain,' *tache de feu*, or *Feuermal*. The *nævus araneus* or 'spider cancer' is not a cancer, but an angioma, consisting of a central elevated red point from which radiate dilated vessels so that there is a rough resemblance to a star. It is commonly single and occurs usually in children of about a year or two years old, and is generally situated on the nose or cheeks. The *nævi* of vascular variety are found in the papillary layer of the upper part of the corium, and consist of irregularly intertwined and dilated capillary vessels of new growth with free anastomosis. In some there is a layer of connective tissue found encircling the vessels, or an enormous growth of connective tissue, so that the result may resemble elephantiasis (q.v.). The treatment for the removal of nævi is surgical. Excision with the knife, ligature, transfixion of the growth with a cataract needle, compression by means of pads retained in place with a rubber band, chemical caustics, such as nitric acid or the acid nitrate of mercury, multiple linear scarification, electropuncture, and electrolysis are the means employed, the last named being the best method of procedure. Vaccination directly upon the nævus is an obsolete means of removal. Port-wine marks may be removed by creating several minute cicatrices with the electric needle. Entire removal of an elevated mass may be effected by electrolysis, as in the case of a tumor (q.v.).

NAFA, nã'fã, **NABA**, or **NAVA**. A seaport on the western coast of the island of Okinawa, in the Loo-choo group, Japan (Map: Japan, H 7). It is the principal seaport of the group, and exports sugar, cotton, and silk to Japan. Population, in 1898, 35,453.

NÄFELS, nã'fêls. A village in the Canton of Glarus, Switzerland, on the Linth, four miles by rail north of the city of Glarus (Map: Switzerland, D 1). It was the scene of a famous battle, in 1388, in which 1500 natives defeated an Austrian force of four times their number. The anniversary of this battle, which freed the canton from the Austrian yoke, is still celebrated. Population, in 1900, 2500.

NAFTIA, nã'f'tê-ã, **LAGO**, or **LAGO DEI PALICI**. A small lake in Sicily, near Palagonia, in the Province of Catania. It is situated in a plain, near craggy hills, in an ancient crater, about 100 meters in diameter. At several points the water bubbles violently, sometimes rising to the height of two feet or more under the pressure of the outpouring of carbonic acid gas. The water is greenish, or turbid, and has an odor

of naphtha. The atmosphere is fatal to birds attempting to fly across the surface of the lake, and to small animals which approach it to satisfy their thirst; while to lean over it is believed to produce dizziness and headache in man. The ancients regarded these phenomena with great dread. Here were worshiped by the Siculi, the pre-Greek inhabitants of the island, a pair of chthonic gods of mighty power, called commonly by the Romans Palici (Gk. *παλικοί*). In the great servile revolt against Rome (B.C. 104) the temple was the centre of the conspirators. Consult Freeman, *History of Sicily*, I. (Oxford, 1891).

NĀGA, nã'gã (Skt., serpent). In Hindu mythology, a member of a fabulous race of semi-divine serpents with human faces, but reptile forms, inhabiting the lower world, where their capital, Bhogavati, was a scene of magnificence and splendor. Sesha, the sacred serpent of Vishnu, was their king. The name Nāga was applied also to an actual race of people in Central India, perhaps so called from their worship of serpents, and this people has left historical traces, although fable and myth doubtless become mixed in allusions to the serpent race.

NAGA. A town of Cebú, Philippines, on the east coast, 11 miles southwest of Cebú. It is a port of call for steamers and coasting vessels. Population, in 1896, 15,093.

NAGANA, nã-gã'nã. A disease of live stock prevalent in South Africa, caused by parasitic *Hæmatozoa*, which are carried from a diseased animal to a healthy one by the tsetse-fly (q.v.).

NAGANO, nã-gã'nô. An inland city of Hon-do, Japan, about 95 miles south-southwest of Niigata (Map: Japan, F 5). It is celebrated principally for the Buddhist Temple of Zenkoji, one of the most famous temples in Japan, founded in the latter part of the seventh century. The town is visited by many pilgrims, and carries on a considerable trade in textiles and woven goods. Population, in 1898, 31,319.

NAGĀRJUNA, nã-gã'r'jôo-nã, or **NĀGASĒNA**, nã'gã-sã'nã. A great Buddhist sage and teacher, the founder of the Madhyamika School of Northern Buddhism, also famous because of his religious conference or discussion with the Græco-Bactrian King Menander or Milinda (q.v.).

NAGAS, nã'gãz. The natives of the Naga Hills in Southeastern Assam. The Nagas of Manipur and the mountains extending to the north (Patkoi, Barai) of this country seem to be Indonesians, more or less pure, while on the Lushai Hills, south of Manipur, are probably Nagas mixed with Kyens and Burmese of Arakan. The Nagas live in permanent villages, the head-men of which hold their power largely by the exercise of sacerdotal functions. Marriage is exogamous, with paternal relationship. Many interesting taboos and kindred usages are in vogue. The Nagas are best subdivided into the Angami and Kanpui of the west, who wear a petticoat or apron, the Lhota and Hot in the centre, who wear a plaid, and the Nangta, or naked, in the east. Consult Hodson, "The Native Tribes of Manipur," in the *Journal of the Anthropological Institute* (London, 1901).

NAGASAKI, nã'gã-sã'kê. The capital of an important prefecture of the same name and one of the principal seaports of Japan, situated

on a small peninsula in the northwest of the island of Kiushiu, in longitude 129° 52' E. and latitude 32° 44' N. (Map: Japan, A 7). The harbor, about three miles long, is one of the safest in the East, and sufficiently deep for vessels of twenty-six feet draught. The town has water-works with filter beds, a meteorological station, schools, a theatre, and hospitals. The principal industrial establishments are the Akanoura Engine Works and several ship yards. The foreign commerce of Nagasaki amounted in 1900 to about \$11,000,000, of which about \$3,500,000 represented exports. The principal imports are cotton, coal, sugar, and petroleum, and the chief exports coal, rice, flour, camphor, vegetable wax, and tobacco. The shipping amounted in 1900 to nearly 2,000,000 registered tons. Nagasaki is an important coaling station. The principal countries of the world are represented at Nagasaki by consuls. Population, in 1900, 120,865, including 1705 foreigners, of whom 1144 were Chinese. The commercial importance of Nagasaki dates from the sixteenth century, when it became the stronghold of the Japanese Christians, and an important centre in the foreign trade of Japan. When the Europeans were expelled from Japan, the Dutch were permitted to maintain their factory on the islet of Deshima (q.v.). Nagasaki then became the only point of communication between Japan and Europe. It was opened to foreign commerce by the treaty of 1858.

NAGCARLÁN, nă'kăr-lăn'. A town of central Luzon, Philippines, in the Province of Laguna (Map: Luzon, G 10). It is situated 11 miles south of Santa Cruz, and has a population of about 13,000.

NAGEL, nă'gel, ALBRECHT EDUARD (1833-95). A German ophthalmologist. He was born at Danzig; studied at Berlin under Gräfe; and after practicing in his birthplace for several years, became docent (1864) and professor (1867) at Tübingen. His most important discovery was the identity of the retinas as opposed to the theory of projection. This is explained in his book, *Das Sehen mit zwei Augen* (1861). Nagel's further writings include: *Die Refraktions- und Akkommodationsanomalien des Auges* (1866); *Behandlung der Amaurosen und Amblyopien mit Strychnin* (1871); and *Die Vorbereitung zum medizinischen Studium* (1890).

NÄGELI, nă'ge-lê, KARL WILHELM (1817-91). A Swiss botanist, born in Kilchberg, near Zurich. After studying at Zurich, Geneva, and Berlin, he began in 1842 to teach botany in Zurich, was made extraordinary professor in 1848, full professor at Freiburg in 1852, in 1855 at Zurich, and finally was appointed to the chair of botany at Munich. He gave to the morphology of plants, especially cryptogams, a great impetus. He also worked upon the genera of phanerogams, pointing out the limitations of species, with especial reference to the occurrence of hybrids, and to their origin through the transformation of species. He was a somewhat voluminous writer on systematic, cytological, and morphological subjects. He discussed in his *Mechanisch-physiologische Theorie der Abstammungslehre* (1883) the causes of the transformation of species, maintaining that each species is compelled by some peculiar internal cause to develop into a new form independently of the environment, and up

to a certain degree independently of the struggle for existence. See PROGRESSION.

NÄGELSBACH, nă'gêls-băc, KARL FRIEDRICH (1806-59). A German classical scholar and professor at Erlangen (1842). He was born in Nuremberg, and was the author of a popular *Lateinische Stylistik* (1846, and often reissued); *Die homerische Theologie* (revised ed. 1861); *Die nachhomerische Theologie* (1857). He edited the *Agamemnon* of Æschylus (1863).

NAGLER, nă'glêr, GEORG KASPAR (1801-66). A German writer on art, born at Untersüßbach, Bavaria. Having settled at Munich as an antiquary, he began the publication of his *Neues allgemeines Künstlerlexikon* (22 vols., 1835-52), a monument of industry and careful research. Another important work is *Die Monogrammisten* (vols. i.-iii., 1857-63; vol. iv., ed. by Andresen, 1871; vol. v., ed. by Clauss, 1879); besides which he published the monographs, *Raphael als Mensch und Künstler* (1835); *Albrecht Dürer und seine Kunst* (1837); *Michel Angelo Buonarrotti als Künstler, and Leben und Werke des Malers und Radirers Rembrandt van Ryn* (1843).

NA'GOR (African name). A West African antelope (*Cervicapra redunca*), one of the reedbucks.

NAGOYA, nă-gō'yă. The capital of the Province of Owari, Japan, in the island of Hondo, 94 miles by rail east-northeast of Kyoto (Map: Japan, E 6). It formerly belonged to the House of Owari, one of the most prominent houses in Japan, whose castle, dating from the beginning of the seventeenth century, is the principal feature of Nagoya, and contains many specimens of the work of some of the best artists of Japan. Another interesting feature is the Buddhist temple of Higashi Hongwanji with beautiful specimens of wood-carving. In the vicinity of the town is the industrial settlement of Seto, where the first glazed pottery in Japan was produced in the thirteenth century, and where the first work in *cloisonné* enameling in the country was done in the nineteenth century. Nagoya is still one of the most important pottery centres in Japan, the industry employing almost its entire population. It has also extensive manufactures of cotton and silk and embroideries. Population, in 1898, 244,145.

NAGPUR, năg-poor', or **NAGPORE**. A division of the Central Provinces (q.v.), British India, comprising the districts of Nagpur, Bhandara, Chanda, Wardha, and Balaghat (Map: India, C 4). Area, 24,127 square miles; population, in 1891, 2,982,507; in 1901, 2,716,748. There are extensive tracts of low marshland throughout the region, and the climate generally is unhealthy. In the more fertile districts, cotton, rice, maize, oil-seed and other seeds, fruits, and vegetables are largely cultivated, and the division is famous for its oranges. The chief minerals are coal, antimony, ochre, and gold. The Gondas (q.v.) inhabit the hilly sections. Nagpur, formerly a part of the great Mahratta kingdom, was ruled by rajas, sometimes called the rajas of Berar, until 1853, when the dynasty became extinct, and the territory was annexed by the British. Capital, Nagpur.

NAGPUR, or **NAGPORE**. The capital of the Central Provinces, British India, and of a division and district, 520 miles by rail east-

northeast of Bombay (Map: India, C 4). It occupies an unhealthy site on the banks of the Nag, a small stream, and with its extensive suburbs covers an area seven miles in circumference. The European quarter is in the Sitabaldi suburb, centred by the fort-crowned Sitabaldi Hill. Here, also, on the north, are the bazaars and the cantonment. Several fine Hindu temples of Mahrattan architecture, handsome gardens, monumental tanks, and the tombs of the Bhonsla Rajas are notable native features. There are manufactures of silk, cotton, and cutlery, and a considerable trade in agricultural produce, salt, and European manufactured goods. Nagpur became the capital of an independent Mahratta raja in 1740. In 1817 it was the scene of an attack by Raja Appa Sahib with 18,000 troops on the British Residency. The Resident, Mr. Jenkins, who had anticipated trouble, and had managed to assemble 1350 men under Col. Scott, defeated the assailants after eighteen hours' fighting. A second battle a month later resulted in the Raja's submission and subsequent deposition. Population, in 1891, 117,014; in 1901, 127,734.

NAGUILIAN, nã'gè-lé'an. A town of Northern Luzon, Philippines, in the Province of La Unión, situated 11 miles southeast of San Fernando (Map: Philippine Islands, E 3). Population, 10,400.

NAGY-BÁNYA, nõ'y'-bãnyõ. A town of Northeastern Hungary, situated among the Lapos Mountains, 90 miles east of Debreczin (Map: Hungary, H 3). It has a State college, and its chief industries are gold, silver, and copper mining. Population, in 1900, 11,169.

NAGY-BECSKERÉK, bãch'kè-rék. A town of Hungary. See BECSKERÉK.

NAGY-KÁROLY, kã'ról-y'. The capital of the County of Szatmár, Hungary, situated 43 miles by rail east-northeast of Debreczin (Map: Hungary, H 3). It has a fine church, a palace of the Counts Károlyi, a Piarist monastery, and gymnasium. Its chief products are coarse cloth, linen, and leather. Population, in 1900, 15,382.

NAGY-KIKINDA, kè'kên-dõ, or GROSS KIKINDA. A town of Hungary, situated 36 miles by rail west of Temesvár (Map: Hungary, G 4). It has a higher gymnasium and an extensive trade in agricultural products and domestic animals. Population, in 1890, 22,923; in 1900, 28,843, over one-half Serbs.

NAGY-KÖRÖS, kè'rësh. A town of Hungary. See KÖRÖS.

NAGY-SZEBEN, sã'bën. A town of Hungary. See HERMANNSTADT.

NAGY-SZOMBAT, sãm'bõt. The Hungarian name of Tyrnau (q.v.).

NAGY-VÁRAD, vã'rõd. A town of Hungary. See GROSSWARDEIN.

NAHANT. A town in Essex County, Mass., on a peninsula extending into Massachusetts Bay; reached by stage from Lynn (four miles), and in summer by steamers from Boston (ten miles) (Map: Massachusetts, F 3). It has a public library with 13,500 volumes. Nahant has been for years a favorite place of summer resort for Boston business men, and has many handsome seaside residences. Population, in 1890, 880; in 1900, 1182. The site of Nahant is claimed to have been the landfall of the North-

men. It was visited in 1614 by Capt. John Smith, and in 1622 was granted to Capt. Robert Gorges. Until 1853, when it was incorporated as a separate town, Nahant was a part of Lynn. Consult Hurd, *History of Essex County, Massachusetts* (Philadelphia, 1888).

NAHARRO, nã-ãr'rõ, BARTOLOMÉ DE TORRES. A Spanish poet and dramatist, born at La Torre, near Badajoz, toward the end of the fifteenth century. He lived at Rome and subsequently at Naples, where he published his collected works under the title *Propaladic* (1517), and dedicated them to Ferdinand d'Avalos, the husband of Vittoria Colonna. His plays have action, character, and plot, and are of historic value; Naharro is called the creator of Spanish comedy. He also wrote ballads, sonnets, and epistles. It was some time before his plays became known in Spain, and the first Spanish edition of them did not appear until 1520. But during the following century his works were very popular, although, owing to his manner of describing the clergy, the later editions were expurgated.

NAHR-EL-ASI, nãr'ël-ã'sè. A river of Syria. See ORONTES.

NAHUATLAN (nã-wãt'lãn) STOCK. An American linguistic group centred about the southern part of the central plateau of Mexico, but with isolated tribes farther to the south, almost to the Isthmus of Panama. The Nahuatl stock, in the commonly accepted scope of the term, includes the Nahua proper or Aztec (q.v.) in and adjoining the valley of Mexico (States of Mexico and Puebla), the Tlascaltec (Tlaxcala), the Cuiclateco (Michoacan), the Cora, the Huichol (Jalisco), the Acaxee (Sinaloa and Durango), the Alaguilac, the Pipil (Guatemala and Salvador), the Niquiran (Nicaragua), and the Segua (Costa Rica), with numerous subtribes and dialects. Traditional and linguistic evidence makes the Nahuatl emigrants from the north, who acquired most of their culture from contact with the superior Mayan and Tarascan civilization after establishing themselves in the southern part of the peninsula. As their social condition advanced, the simple primitive system of ruling chiefs developed in some cases, particularly among the Aztec, into a regular hereditary monarchy. Descent and inheritance, both of office and property, were in the male line, but land was held by the clan, and marriage was regulated by gentile laws of kinship. Agriculture was the basis of national existence and was governed by strict laws, while the arts of weaving, pottery, and architecture reached a high degree of perfection. Gold, silver, and copper were worked, and a bronze alloy has been reported, but the ordinary tools and implements were still of stone or obsidian. Religious rites were observed with elaborate and imposing ceremonies, conducted by priestly orders of both sexes, which controlled also the education of the children. At Tenochtitlan or Mexico, the capital of the Aztec Empire, thousands of captives were annually devoted to the bloody rites of human sacrifice and cannibalism in honor of the god of war. Literature was extensively cultivated in the form of pictograph records and rituals, which were painted in brilliant colors upon books of maguey paper or dressed skins, very similar to those in use among

the Maya. The calendar, which was the common property not only of the southern Nahuatl nations, but also of several neighboring peoples, recognized the year of 365 days, and may have been of Maya origin, although developed along different lines. The Nahuatlans are now represented by nearly two million people, most of whom, although subjugated and to a certain extent Christianized, still occupy their ancient territories in nearly their ancient fashion, having adopted but little of the newer civilization in the place of that destroyed by the conqueror. The principal sources of information upon the history and civilization of the Nahuatlans tribes are: Sahagun, *Historia general de las cosas de Nueva España* (Mexico, 1829-30), and Prescott, *History of the Conquest of Mexico* (New York, 1843). See CORTÉS; MEXICO; MONTEZUMA; and tribal headings.

NAHUEL-HUAPI, ná-wál'wá-pé', or **TIGER LAKE**. A lake on the eastern slope of the Andes Range in Argentina, on the boundary between the territories of Neuquen and Rio Negro (Map: Argentina, C 12). It is 75 miles long, with an average width of 10 miles and an area of 309 square miles. It contains a number of islands covered with luxuriant vegetation, and its banks are fertile and well watered. It receives many streams, and discharges into the Atlantic Ocean through the Rio Negro.

NAHUM. The seventh of the minor prophets according to the usual arrangement. Nothing is known of his life except what may be gathered from the notice in the first verse of his prophecy, where he is called 'the Elkoshite.' Where Elkosh was is uncertain. It has been located in Galilee and in Assyria; a third identification is with Beit Jibrin (Eleutheropolis) in the Shephelah. Nahum's prophecy consists of two parts, besides the introductory verse: (1) A psalm (i. 2-ii. 2), which describes the majesty of God and His punishment of His enemies in somewhat general terms; and (2) the prophecy proper (ii. 3-iii. 19), which foretells the doom of Nineveh. The style is full of animation and fancy, and, at the same time, clear and rounded. The text is in part corrupt. The date of the prophecy cannot be fixed exactly, but must have been later than the capture of Thebes in Egypt (the "No" of iii. 8; see NO-AMON), by Assurbanipal, B.C. 664-663; and it must have been before the fall of Nineveh, about B.C. 606. The recent investigations of Bickell and Gunkel have established with certainty traces of an original acrostic arrangement in the psalm, and this artificiality points to a late date for this part of the book; it fits in with the conditions existing during the Persian rule in Palestine, when the religious community of Jerusalem was struggling against great odds, and may have been prefixed by an editor to the genuine prophecy of Nahum as an appropriate introduction. If this be the fact, it would be quite in accordance with the free treatment to which older discourses were subjected by post-exilic compilers. Consult the commentaries mentioned in the article MINOR PROPHETS; Bickell, *Beiträge zur semitischen Metrik* (Vienna, 1894); Gunkel, in *Zeitschrift für alttestamentliche Wissenschaft*, vol. xiii. (1893); Nestle, in *Zeitschrift des deutschen Palästinaverains*, vol. i. (1878); Davidson, "Nahum, Habakkuk, and Zephaniah," in the *Cambridge*

Bible for Schools and Colleges (Cambridge, 1896).

NAHUYS VAN BURGST, ná'hois ván boorast, HUBERT GERARD, Baron (1782-1858). A Dutch colonial soldier and geographical author, born in Amsterdam. In 1809 he went to Batavia, where he entered the army, and fought against the English in Bengal. In 1814 he was appointed commissioner to the Prince of Java. Nahuys was pensioned in 1830, and nine years afterwards returned to Holland, settling at Breda. His writings, which are of no small geographical importance, include: *Schets van Benkoelen op de westkust van het eiland Sumatra* (1826) and *Beschouwingen over Nederlandsch-Indië* (1847; 2d ed. 1848).

NAIADS, ná'yadz (Gk. *Naiðes*, *Naiðes*, *Naiðes*, *Niades*, from *nár*, *nan*, to flow; connected with Lat. *navis*, Gk. *naûs*, *naus*, Skt. *náu*, ship). In Greek mythology, the nymphs of the springs, and hence also of rivers. Caves, especially with trickling water, were sacred to them and believed to be their dwellings. Owing to the medicinal qualities of some springs, the Naiads naturally appear as healing divinities, and as divination was associated with the water, they became prophetic. Under their influence the prophet became inspired or even mad. See also NYMPH.

NAIANT, ná'ant, or **NATANT**, ná'tant (OF. swimming). An heraldic term applied to a fish when borne horizontally across the shield in a swimming position. See HERALDRY.

NAIL (AS. *nægel*, OHG. *nagal*, Ger. *Nagel*, nail, Goth. *ga-naglijan*, to nail; connected with OChurch Slav. *nogŭti*, Lith. *nagas*, Skt. *nakha*, nail). The terms nail, claw, and hoof are popular names for different developments of the same epidermal formation. All are horny secretions formed from the outer layer of the skin, primarily to protect the tip of the digits in the higher vertebrates. Nails have retained this function, while claws have become specialized as weapons of offense or defense, and hoofs are specialized to protect the whole of the terminal joint of the digit. Hoofs are usually thick, heavy, and blunt, and are best developed where the number of digits is reduced; they are characteristic of the great group of herbivorous animals known as Ungulata, and reach their highest development in the horse. Nails are flattened, usually thin, and more or less rounded at the end. They are present in some reptiles, in certain birds (as the grebes), and in many mammals, especially the monkeys and man. Compare HORN.

HUMAN NAILS. These are the elastic, horny plates placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a root, or part concealed within a fold of skin; a body, or exposed part attached to the surface of the skin; and a free anterior extremity called the edge. The skin below the root and body of the nail is termed the matrix, from its being the part from which the nail is produced. This is thick and covered with highly vascular papillæ, and its color is seen through the transparent horny tissue. Near the root the papillæ are smaller and less vascular; hence the portion of nail corresponding to this part is of a whiter color; from its form, this portion is termed the lunula. The chemical composition of the

nails is given in the article HORN. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. The general state of health influences the growth of nails, and after illness a deficient formation of horny matter may result, shown by the production of a groove across the nail. The breadth and position of this groove indicate roughly the period and duration of the illness. An inflammation of the matrix of the nail is called *onychia*, and an acute inflammation of the tissues about the nail is termed *paronychia* or *whitlow*. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most usual seat is the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed, in which the nail is imbedded. In obstinate cases, it is not infrequently necessary to remove a portion of the nail, an operation which may be done under local anæsthesia without pain.

NAILS. Slender pieces of metal, tapering toward and sometimes pointed at one end, and with flattened or rounded heads. Nails are made of many different materials, as copper, zinc, brass, iron, or steel, but the bulk of the nails in ordinary use are made of steel wire. Iron nails, in turn, may be either wrought, cut, or cast, or made from wire.

Until almost the close of the eighteenth century all nails were hand-made. In France for nearly a century light nails for carpenter work have been made of wire, but until 1850 they were made by hand with a hammer. The hand-made nail was pinched in a vise, with a portion projecting. A few blows of a hammer flattened one end into a head. The head was beaten into a counter sunk in the vise, thus regulating its size and shape. In Northern Europe, Britain, and America nails were made, at first, by forging on an anvil. The iron used for hand nail-making was first formed into nail-rods, which were sold in bundles. The nail-rods were prepared either by rolling the malleable iron into small bars of the required thickness or by the much more common practice of cutting plate iron into strips by means of rolling-shears. In colonial days the making of nails from these rods was a household industry among the New England farmers.

To America belongs the distinction of having first made cut nails by machinery, and with the advent of machine-cut nails the household industry of nail-making rapidly declined. Of these early inventions, the only one that has survived is that patented in 1786 by Ezekiel Reed, of Bridgewater, Mass. At the close of the eighteenth century twenty-three patents for nail machines, or improvements thereto, had been granted in the United States, and their use had been generally introduced into England, where they were

received with enthusiasm. In 1883 cut nails were first made of steel.

The manufacture of tacks was also a household industry in New England till well into the nineteenth century. The wire was pointed on a small anvil; it was then placed in a vise, worked by the foot, which clutched it between jaws furnished with a gauge to regulate the length. A certain portion was left projecting, which was beaten by a hammer into a flat head. New England, and particularly the city of Taunton, Mass., is now the centre of the tack-making industry in the United States.

Wire nails were first made in the United States by William Hersel, of New York, in 1851 or 1852. In 1875 Father Goebel, a Catholic priest, came to Covington, Ky., from Germany, where the art of making wire nails was practiced. Goebel began the manufacture of wire nails at Covington, and in 1876 the American Wire and Screw Nail Company was established under his leadership. At first the nails were made by hand, but soon a French machine was imported. In this machine the nails were held in dies to form the head. The blow of the hammer which produced the head was caused by a board or single leaf spring suspended from a ceiling, against which the machine, in rotating, pushed a cam. The release of the latter produced the blow.

For a time the wire nails were made with barbs, that they might hold more securely, and the new industry grew but slowly. In 1876, at the Centennial Exhibition, the company received a silver medal over French and German competitors. This called the attention of the trade to the article, and two other firms at once took up its manufacture. By 1885 there were twenty-six firms in the business, and the wire nail had been adopted by many manufacturers. Since then their use has rapidly increased.

Two types of wire-nail machines are described in Smith's *Treatise on Wire*. (See *Bibliography* at end of article.) In one type "The wire is automatically straightened from the coil and fed into the machine, where dies grip it, while a pair of nippers cuts the wire off in suitable lengths, when it is automatically pointed and headed. The latter operation is effected by means of the spring-bolt mechanism operated by a cam of the main shaft and remaining inoperative until a sufficient length of wire has been fed to the machine for the next nail. The cutting and pointing are performed in one operation." In the second type, the heads are formed by steady pressure instead of intermittent striking.

The older process of making cut nails is, in general, as follows: The ore, whether hematite or magnetic, is smelted in a blast-furnace, run into pigs, puddled, squeezed, and, if need be, hammered, rolled in the puddling-ball train, and cut to lengths. These are then fagoted—that is, piled so as to break joints—reheated to a white heat, drawn, passed through the nail-plate train, and the sheets, of the required width and thickness, allowed to cool. It is next cut across its length (the width of the sheet being usually about a foot) into strips which are a little wider than the length of the required nail. These plates, heated by being set on edge on hot coals, are seized in a clamp and fed to the machine, end first. The pieces cut out are alternate, and

slightly tapering, of course, with the fibre, and are squeezed and headed up by the machine before going into the trough.

In 1897 the wire nails produced in the United States amounted to 8,997,245 kegs of 100 pounds each. The output of cut nails for the same year was 2,106,799 kegs. American wire nails are largely exported to Europe and to other parts of the world. In 1898 the total number of cut-nail and cut-spike works in the United States was 55; the total number of wire-nail works was 79.

The accompanying table shows the export of nails from the United States for the past decade.

NAILS EXPORTED FROM THE UNITED STATES

(From the Statistical Abstract for 1900, prepared by the Bureau of Statistics, under the direction of the Secretary of the Treasury)

YEAR	Cut		Wire, wrought, horse-shoe, and all other, including tacks		Wire		All other, including tacks	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value
1891.....	11,723,727	\$283,839	1,768,433	\$156,858				
1892.....	12,197,669	273,191	2,066,267	160,239				
1893.....	15,604,347	330,554	2,300,501	158,093				
1894.....	16,736,643	330,118	3,233,776	180,607				
1895.....	16,895,428	283,646	4,367,267	210,192				
1896.....	20,730,260	428,630	6,031,297	321,055

1900.....	24,915,866	647,711			84,635,468	2,124,528	4,341,249	278,709

Consult: Swank, *History and Manufacture of Iron in All Ages* (Philadelphia, 1892); Smith, *Treatise on Wire, Its Manufacture and Uses* (London and New York, 1891).

NAIN, nā'in (Gk. *Natv*). A town in Galilee, mentioned in Luke vii. 11-17 as the scene of Jesus' miracle of raising a widow's son from death. The site is now occupied by a miserable mud village (modern name Na'in), but ruins near by show that once a city of some size existed on the spot. The situation on the slopes of 'Little Hermon,' about six miles southeast of Nazareth, is beautiful, commanding a view of the plain of Esdraelon, Mount Carmel to the southwest, Mount Hermon to the northeast, and of the varied landscape of Central Galilee.

NAIN SING (?-1882). A Hindu explorer in Central Asia. He was born at Numaon; was trained by a Colonel Montgomerie for exploring work, and in 1856 and 1857 was employed in Kashmir and Ladak by the Schlagintweits. His journey to Lhasa (1865-66) was rewarded by the Royal Geographical Society; in 1867 he explored the gold mines of Thok Jalung, and he went with Sir Douglas Forsyth to Yarkand in 1873. His most important journey was from Leh across the unexplored plateau of Tibet in 1874-75, marking its many lakes, to Lhasa, and thence to Calcutta. For a description, with map, of this expedition, consult the *Geographical Magazine* of 1876.

NAIPALI (nī-pā'lē) **LANGUAGE**. The Indian language spoken in Nepal. This dialect approaches in general structure more closely to Hindi than to any other of the modern Indian vernaculars. Thus, as examples showing the affinity of Naipali to the New Indian dialects, may be cited Naipali *pāk*, 'ripe,' Bengali *pākā*, Hindi *pakkā*, Sindhi *pakō* (Skt. *Pakva*); Naipali *mahaingō*, 'costly,' Hindi *mahaingā* (Skt. *mahārgha*); Naipali *dhilō*, 'loose,' Hindi *dhilā* (Skt. *dhīlā*); Naipali *dāt*, 'milk,' Hindi *dudh*, Panjabi *dudd* (Skt. *dugdha*). In inflection also there are parallels, as Naipali *gar chum*, 'I do,'

Gujarati *karuṁ chum*. Distinctive marks of Naipali are the occasional aspiration of medial consonants (e.g. *aghi*, 'before,' Hindi *age*, Prakrit *aggē*, Skt. *agrē*), softening of initial surds (e.g. Naipali *garanu* 'to make,' Hindi *karnā*, Skt. *kar*), and the use of an agential case as the active subject of a passive voice (a curious phenomenon widespread in the modern Indo-Iranian languages), in *-le* corresponding to the Hindi *-nē* (e.g. Naipali *dātīlē*, '[by the] milk,' Hindi *dudhnē*). The language has a number, possibly one-fifth, of loan-words from its Tibeto-Burman neighbors, but has maintained

itself on the whole with considerable purity. It has a very scanty literature written in the Devanagari character.

Consult: Turnbull, *Nepali Grammar, and English-Nepali and Nepali-English Vocabulary* (Darjiling, 1888); Hoernle, *Comparative Grammar of the Gaudian Languages* (London, 1880).

NAIRN, nārn. The capital of Nairnshire, Scotland, a royal and Parliamentary burgh, 15 miles northeast of Inverness, at the mouth of the river Nairn (Map: Scotland, E 2). It is noted for the excellence of its sea-bathing and artificial baths. It manufactures rope and twine. Population, in 1891, 4500; in 1901, 5100.

NAIRNE, nārn, CAROLINA (OLIPHANT) (1766-1845), Baroness. A Scotch song-writer, born at Gask, Perthshire. In 1806 she married her second cousin, Major William Murray Nairne (afterwards sixth Lord Nairne); lived in Edinburgh till her husband's death (1829); afterwards in Ireland and on the Continent; and returned to Gask, where she died. Between 1821 and 1824 she contributed songs to *The Scottish Minstrel* of R. A. Smith. As a song-writer, she is highly esteemed. Particularly beautiful are "Land o' the Leal," "Caller Herrin'," "The Laird o' Cockpen," and "The Auld House." Consult: Rogers, *Life and Songs of Lady Nairne* (Edinburgh, 1869); Kington Oliphant, *Jacobite Lairds* (Grampian Club, 1870).

NAIRN'SHIRE. A county in the northeast division of Scotland, bounded by the Moray Firth and the counties of Inverness and Moray (Map: Scotland, E 2). Its area is 195 square miles, of which about 26,000 acres are under cultivation. There is considerable agricultural activity, and the county is known for its cattle-breeding. Nairn is the only town of importance. Population, in 1801, 8300; in 1851, 10,000; in 1891, 9155; in 1901, 9300.

NAIRS, nā'ērz. The inhabitants of Malabar, in Southwestern Hindustan. They are a con-

glomerate of different castes and tribes, and in many cases contrast sharply with the Dravidians by their fine type, their light complexion, and their thin and prominent nose. They seem to have some linguistic and somatological affinities with the Indo-Aryans. They are probably a mixed race of Aryans and Malayalas. By all writers they are described as a tall people, prepossessing in their physical characteristics and their general bearing, and gracious in manner. Many of the women are quite pretty. The history of the Nairs begins with the invasion of the ancient Hindus and the establishment of a Brahman aristocracy—a conflict between these privileged classes and the democratic masses ended in victory for the latter and laid the foundations of the prosperity of the Nairs in the thirteenth century. Islam of a sort is in vogue, together with the older Hinduism. Through all these changes the peculiar marriage system, which has made the Nairs of special interest to ethnologists, has remained unchanged. This system, often called 'the Nair family,' is polyandry (often adelphic) with matriarchal joint family, though polyandry and polygamy may exist side by side or be inextricably mixed. The wealthy tend to be polygamous, the poor polyandrous. Consult: E. S. Schmidt, "Die Nairs," in *Globus*, vol. lxxviii. (Brunswick, 1895); Fawcett, "Nayars of Malabar," in *Bulletin of the Madras Government Museum*, vol. iii. (Madras, 1901).

NAISSANT, nā'sānt (Fr.; being born). A term applied in heraldic blazon to an animal depicted as coming forth out of the middle—not, like *issuant*, out of the boundary line—of an ordinary. See **HERALDRY**.

NA'JA (from Hind. *nāg*, Skt. *nāga*, snake). A genus of elapine venomous serpents of the tropical parts of the Old World, which includes the cobras. The typical species is the common hooded cobra (*Naja haje*) of Africa, called 'asp' in the north and 'spy-slange' or spitting-snake among the Dutch of South Africa. Other species are the cobra di capello and hamadryad. See **COBRA**; **HAMADRYAD**; **PROTEROGLYPHA**.

NAJAC, nā'zhāk', EMILE, Count de (1828-89). A French dramatic author, born at Lorient (Morbihan). Except for a short time spent in a Government position, he gave himself entirely to the writing of farces, texts for operas, and vaudevilles, sometimes in collaboration, and sometimes alone. Among these are: *Un mari en 150* (1853); *La fille de trente ans* (1859, with Scribe); *Le capitaine Bitterlin* (with About, 1860); *Un mariage de Paris* (with About, 1861); *Nos gens* (with About, 1866); *Bébé* (with Hennequin, 1877); *Nounou* (with Hennequin, 1879); *Divorçons* (with Sardou, 1880); and *Le fiacre 117* (with Millaud, 1886).

NAKAMURA MASANOWO, nā'ka-mōō'ra mā'sā-nō'wō (1825-?). A Japanese scholar, born in Yedo. He went to England in 1866 and remained there for two years, returning home on the outbreak of the Revolution. Thenceforth until his death he labored perseveringly in the interest of modern education. His schools and translations exerted wide influence, and his services were recognized by posthumous honors conferred by the Emperor.

NAKED BAT. A large Malayan, long-tailed, emballonurine bat (*Chiromeles torquatus*), re-

markable in having the skin entirely hairless except for a fringe of hairs about the neck. It has a projecting, pig-like snout and a thick tail. It inhabits the forests of Java, Sumatra, and Borneo, where it appears only at night. Its most curious feature is the presence of a pouch or pocket of skin on each side of the body under the arms, which is present in both sexes, and contains the mammae. In this pouch the young are carried while suckling. Consult: Dobson, *Catalogue of Cheiroptera in the British Museum* (London, 1878); Horsfield, *Zoölogical Researches in Java* (London, 1828). See **PLATE OF BATS**.

NAKHITCHEVAN, nā'kè-chē-vān'. A former town in the Government of Ekaterinoslav, Russia, situated on a hill on the right bank of the Don, 2½ miles from Rostov-on-the-Don, with which it is now incorporated. It has manufactures of silk, woolen, and silver goods, and has a considerable trade in jewelry and precious stones with Constantinople, Turkestan, Circassia, and Astrakhan. The town was founded by Armenians from the Crimea in 1779, and is the see of the Russian Greek-Armenian Patriarch. Population, in 1897, 29,312, mostly Armenians.

NAKONG (African name). One of the 'harnessed' antelopes of South-Central and East Africa, called also 'Speke's antelope,' 'sitatunga,' and *Tragelaphus Spekei*. It is peculiar for its perfectly uniform grayish color when mature. It formerly gathered in herds, and was one of the most highly prized of the smaller species. See **PLATE OF GAZELLES AND SMALL ANTELOPES**.

NAKSHATRA, nāk-shā'trā (Skt. *nakṣatra*, star, luminary; of doubtful etymology). A Sanskrit term used in the Vedic period in the sense of star. At a later time it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon was supposed to rest in its path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into the daughters of Daksha, who became the wives of the moon. The French astronomer Biot endeavored to show that the Hindu system of the Nakshatras was derived from the Chinese *sien*; but this theory won little favor. The arguments later advanced warmly favored the Indian origin of the system of the Nakshatras. Weber sought for Babylonian influence to explain the Nakshatras and some support has been given to this view. Consult Thibaut, "Astronomie. Astrologie und Mathematik," in Bühler, *Grundriss der indo-arischen Philologie* (Strassburg, 1899).

NAKSKOV, nāks'kōv. A town of Denmark, situated on a fiord of the west coast of the island of Laaland (Map: Denmark, E 4). It is the terminus of the Laaland Railroad, and has a harbor with considerable shipping and an active trade in grain. Population, in 1901, 8317.

NALA, nā'lā. A legendary king of ancient India whose domain was Nishadha, apparently a district between the modern Oudh and Berar. The story of his marriage with Damayanti, the daughter of King Bhima of Vidarbha (modern Berar), together with the events which followed in consequence of his passion for gambling, the loss of his kingdom, his desertion of wife and children, the final reunion with them, and the restoration of his fortunes, forms one of the most romantic episodes of the *Mahābhā-*

rata (q.v.). This episode, entitled the *Nalopakhyaṇam*, or Story of Nala, has often been separately edited and translated; as an edition of the Sanskrit text, together with Dean Milman's translation, by Monier-Williams (Oxford, 1879); a versified rendering by Sir Edwin Arnold, *Indian Idylls* (Boston, 1883); a translation into German prose by Kellner, *Nala und Damayanti* (Leipzig, 1886), and several others.

The subject of Nala's career was a favorite theme with the Hindus. One of these, the Sanskrit *Nalodaya*, or Rise of Nala, describes in four cantos the restoration of Nala's fortunes. This artificial poem is ascribed to Kalidasa, but it probably belongs to a much later age. It is a remarkable specimen of the so-called Kavya style of artificial composition, abounding in elaborate metrical devices, alliterative versification, and intricate rhythms, complicated constructions, and pedantic imagery. It has been edited by Benary (Berlin, 1830), by Yates (Calcutta, 1844), and by Vidyasagara (ib., 1873). An excellent German translation, imitating the artificial devices of the original, was made by von Schack, *Stimmen vom Ganges* (2d ed., Stuttgart, 1877).

To the same Nala cycle belongs the *Naiṣhadhiya*, or *Naiṣhadha-Carata*, Adventures of Nala of Nishadha, written in twenty-two cantos by one Sri-Harsha, who belongs to the latter half of the twelfth century of our era. An edition of this, with the Sanskrit commentary of Narayana, was published by Röer (Calcutta, 1855), and Swadatta (Bombay, 1894).

NAMANGAN, nā'mān-gān'. A district town in the Territory of Ferghana, Russian Turkestan, situated on the canal of Yangi (fed by the Naryn), about 45 miles northwest of New Margelan, the capital of the territory (Map: Asia, Central, M 1). The chief occupations are cotton-ginning and the manufacturing of soap, leather, etc. The trade in cotton, fruit, and animal products is important. Population, in 1897, 61,906, including only a few Russians.

NAMAQUALAND, nā-mā'kwā-lānd, LITTLE. A division of Cape Colony bordering on German Southwest Africa (Map: Cape Colony, D 6). It has an area of 19,154 square miles, with a population of 16,800 in 1891. It is important on account of its copper deposits. The chief town is Port Nolloth on the coast.

NAMAYCUSH, nām'ā-kūsh (North American Indian name). The lake or Mackinaw trout (*Chistomere namaycush*), the largest of the Salmonide. It is closely related to the charr, from which it differs slightly in the character of the vomerine teeth. It is a very good food-fish and is the second in commercial importance of the fish of the Great Lakes. Extreme weights of 125 pounds have been reported, but the average is from 15 to 20 pounds. Its food is fishes and a great variety of other things. The spawning season is during September and November. The *namaycush* occurs in the Great Lakes, and in the inland lakes of New York and Northern New England, where the local names 'longe' and 'togue' are applied to it. It is also found in the headwaters of the Fraser and Columbia rivers, and the streams of Vancouver Island. A deep-water variety, called *siscowet* (q.v.), is found in Lake Superior. Its flesh is fatter and less desirable as food. See SALMON; TROUT; and con-

sult authorities there cited. See Plate of TROUT AND GRAYLING.

NAM DINH, nām dēn'y'. A city of Tongking, French Indo-China, situated 40 miles south-east of Hanoi, on the Tongking River, 30 miles from the sea (Map: French Indo-China, E 2). It lies in the most fertile region of the delta, and is prosperous and well built, with broad, paved streets. It is the seat of a French resident, and the intellectual centre of Tongking. It is almost as important commercially as Hanoi, has numerous well-stocked shops, regular boat service on the river, and a brisk trade in rice, silk, cotton, and indigo. Population, about 30,000.

NAME (AS. *nama*, Goth. *namō*, OHG. *namo*, Ger. *Name*; connected with Lat. *nomen*, Gk. *ὄνομα*, *onoma*, Ir. *ainm*, OPruss. *emnes*, OChurch Slav. *ime*, name, and with Lat. *gnoscere*, Gk. *γινώσκειν*, *gignōskein*, Skt. *jāṇ*, Ger. *kennen*, Eng. *know*). In law, a word or words employed to designate a person, place, or thing. In early times in England the Christian name was the only one recognized by the law, and surnames were mere words of description to identify one person from another of the same Christian name. This practice was confirmed and received legal sanction by a statute (1 Henry V., c. 8), called the "Statute of Additions," which provided that not only the name of an individual should be inserted in a writ or indictment, but his estate or degree, his calling or business, and the town or district in which he resided. By reason of the above custom and the statute, many persons who had not otherwise adopted surnames were known by the name of their calling, place of residence, or by some other characteristic. Thus, George, the smith, became George Smith, and John of Wessington became John Wessington or Washington.

The middle name or initial of a person is generally regarded as of no importance, and not a part of his legal name. Therefore the omission of it in a legal instrument or proceedings is not considered an error, except in a few jurisdictions. In general a person's Christian name should be written out, and in some States the mere initial of the Christian name, together with the surname, has been held insufficient under statutes requiring the names of persons to be subscribed to certain instruments, as a petition for a highway.

Owing to the almost infinite variety of surnames and the consequent difficulty in spelling them properly, the courts have adopted a rule known as *idem sonans* (the same sound), by which they determine whether or not an incorrect spelling of a name is a fatal error in legal documents. Briefly stated, the rule provides that where a name is not correctly spelled, if it sounds identically like the name intended to be written, it will be held sufficient, the error in spelling being disregarded. Thus the surnames Preyer, Prior, and Pryor have been held to be *idem sonans*. This rule is followed as to legal instruments and transactions generally, but where a name in an instrument varies in some irregular manner from the common method of spelling a name identically the same in pronunciation, the necessity for departing from such a doctrine is apparent, as in the case of such as Jaeger and Yaejer, which may be pronounced so as to sound alike, and a person searching

against the name of Jaeger would naturally not find the record of the conveyance under Yaeger; and accordingly the courts may hold that the public is not bound by constructive notice in such a case.

There are statutory provisions in some jurisdictions requiring the registration of fictitious trade names, where persons adopt them and do not do business under their correct names. Corporations are usually required to adopt names which are not identical with those of other corporations in the same State. At common law there is no property right in a name, but the United States Statutes provide for protection in the use of trade names to a certain extent, and courts of equity will sometimes interfere to enjoin the wrongful use of the business name of another, to prevent fraud. See **COGNOMEN**; **MISNOMER**; **TITLE**; **TRADE-NAME**; **TRADEMARK**.

NAMUR, nâ'mur'. A province of Belgium, bounded on the north by Brabant and Liège, on the east by the Province of Luxemburg, on the south by France, and on the west by Hainault (Map: Belgium, C 4). Area, 1390 square miles. The province is traversed through the centre by the Meuse River. Its surface is partly level, partly hilly, and in part densely forested. The soil is very fertile, and agriculture is the chief occupation, though a large proportion of the population is engaged in mining and allied industries. About 750,000 tons of coal are mined yearly, and the province is rich in iron, lead, sulphur, alum, and marble. Population, in 1900, 346,512. Namur appears as a county as early as the tenth century, and came later successively under the counts of Hainault and Flanders, and the dukes of Burgundy, finally constituting one of the seventeen provinces of the Netherlands.

NAMUR. The capital of the Province of Namur, Belgium, at the confluence of the Sambre and Meuse, 35 miles southeast of Brussels (Map: Belgium, C 4). Two bridges across the Meuse connect it with the extensive suburb of Jambes, and several bridges span the Sambre, connecting it with the suburb of Salzinnes. An extensive circle of nine detached forts has revived its former military importance, and there are large cavalry barracks in the town. Among many fine churches is the Renaissance Cathedral of Saint Aubin, built in 1751-67, and noted for the beauty of its statues, carvings, and paintings. The Archaeological Museum has a valuable collection of Roman and Frankish antiquities, and an art gallery is attached to the Hôtel-de-Ville. Namur is an important industrial centre, with iron and brass foundries, and is known for its manufactures of cutlery, glass, leather, and bronze art objects. The city was taken by the forces of Louis XIV. in 1692, and three years later was besieged and captured by William III. It was taken by the French in 1746, and restored to Austria in 1748. For a third time it fell into the hands of the French in 1792. Population, in 1900, 32,333.

NANA, nâ'nâ'. One of the Rougon-Macquart series of novels by Emile Zola (1880). It is a study of a courtesan in whom are depicted the fruits of an evil heredity and their reflex influence on society.

NANAIMO, nâ-nî'mô. A town and port of Vancouver Island, British Columbia, Canada,

on Departure Bay, on the east coast (Map: British Columbia, E 5). It is opposite Vancouver town on the mainland, with which it has daily steamboat communication. It has a safe and commodious harbor, and is the centre of the coal-mining industry of British Columbia, its coal fields having an area of 200 square miles. It also has large lumber mills. The town dates from the erection of the Hudson's Bay Company block-house in 1833. It was incorporated in 1874, and has municipal gas, electric lighting, and water works, telephone system, etc. The United States is represented by a consular agent. Population, in 1891, 4595; in 1901, 6130. Consult Bell, *Canadian Mining Manual* (Montreal, 1893).

NANA SAHIB, nâ'nâ sâ'hîb (c.1820-?). A Hindu, one of the leaders of the Sepoy mutiny of 1857. He is said to have been the son of a Brahman from the Deccan, and his real name was Dhundu Pant. He was born about 1820, and was adopted as a son in 1827 by Baji Rao, the childless ex-peshwa of Poona, whose estate, which amounted to more than a million dollars, he inherited. He was refused, however, the annual pension of eight lacs of rupees, or about four hundred thousand dollars, which had been granted Baji Rao during his lifetime. This rankled in his mind, although he was allowed to retain some of the state of a native prince, a retinue of 200 soldiers, with three field-pieces, and a fortified residence at Bithur, 10 miles west of Cawnpore. He had long maintained an agent in England, Azim Ulla Khan, who told him tales of British weakness. When, therefore, the mutiny broke out in May, 1857, Nana Sahib offered to assist the English, but treacherously placed himself at the head of the mutineers in Cawnpore. The European troops were induced, on June 25th, to capitulate to Nana Sahib, who promised they should be sent down the Ganges in safety. They embarked on boats provided for them, but had not sooner done so than a murderous fire was opened upon them. The sepoys were ordered to shoot the men, but to spare the women and children, who were removed to a house in Cawnpore. On July 15th Sir H. Havelock, who had advanced from Allahabad, defeated the sepoys in two engagements, one within eight miles of Cawnpore; and Nana Sahib thereupon directed that the women and children should be put to death and that their corpses should be cast into a well, which is now marked with a beautiful statue in their memory. A long series of engagements against Nana Sahib followed, in which he was always the loser, and he was ultimately driven beyond the English frontier into Nepal, where he probably perished in the jungle.

NAN-CHANG-FU, nân'châng'fû'. The capital of the Province of Kiang-si, China, situated at the head of the delta formed by the Kan-kiang at its entrance into the Po-yang lake, about 175 miles southeast of Hankow (Map: China, E 6). It is an important centre of the porcelain trade. Population, estimated at 100,000.

NANCY, nân'sé'. The capital of the Department of Meurthe-et-Moselle, France, and an important railroad junction, 220 miles east of Paris, and 94 miles west of Strassburg, on the left bank of the Meurthe, six miles above its junction with the Moselle (Map: France, N 3). It is a strongly fortified and well-built city, with fine squares, broad streets, and imposing edifices.

The city owes much of its architectural ornamentation to Stanislas Leszczyński, King of Poland, who resided here as Duke of Lorraine. His statue stands in the Place Stanislas, the most important square in the city, surrounded by imposing edifices, including the theatre, the Hôtel-de-Ville, and the Episcopal Palace.

The Hôtel-de-Ville, dating from the seventeenth century, contains a fine ballroom with mural paintings by Girardet. The Ducal Palace is an attractive example of the Gothic style and holds the Musée Lorrain, a collection of historical and other antiquities. The cathedral is a creation of the famous Mansart. Nancy has seven fine triumphal arches, the most elaborate one being the Porte Royal, constructed under Louis XV. Among other structures of note are the Gothic Church of Saint Epvre, an ancient Gothic castle, and the Palais du Gouvernement, now used for military purposes.

Nancy has a university (see below), a noted school of forestry (the only one in France), one of the two French hypnotic schools, an important hospital, a seminary, a botanic garden, and a public library of over 100,000 volumes and 5000 MSS. Attached to the school of forestry is a valuable forestry museum.

The situation of Nancy on the Eastern Canal and the Canal Marne-au-Rhin gives it a large trade. Its principal manufactures are embroidery, hardware, boots and shoes, straw hats, woollen goods, and agricultural implements. The great breweries here are among the most important in France. In art industries the city furnishes many unique features and varieties. Not a few of the artistic specialties in furniture and in printing in France originated here. To facilitate traffic, a belt line railway has been built. Population, in 1891, 78,110; in 1901, 102,559.

Charles the Bold was overwhelmed and slain before the gates of Nancy in 1477 in battle against René of Lorraine and his Swiss mercenaries. Nancy was the seat of the dukes of Lorraine down to 1766, in which year it came to France. The town has greatly grown in general importance since the loss of Alsace-Lorraine by France, large numbers of Alsations coming here to live.

NANCY, UNIVERSITY OF. One of the leading universities of France, founded originally at Pont-à-Mousson. It had its inception in the papal bull of 1572, issued at the instance of the Cardinal of Lorraine, and consisted at first of two faculties: Theology and Arts. It was surrendered to the Jesuits to combat heresy. A law faculty was added in 1582 and a medical faculty in 1598. The University maintained a steady growth and in 1608 its attendance reached about 2000. This growth was checked by the wars of the seventeenth century. In 1768 it was removed to Nancy by the order of Louis XV. During the stormy days of the French Revolution it went down with the rest of the French universities, but was not reorganized at the establishment of the University of France. In 1852, at the instance of forty municipalities a rectorate was established, and in 1854 the faculties of Letters and Science were organized. In 1864 the faculty of Law and in 1871 the faculty of Medicine, consisting mostly of professors who had come over from Strassburg University, were established. Until 1896 these were known as Facultés de Nancy and were

under the control of the University of France, but with the dissolution of that university, Nancy became autonomous. In 1902 the University of Nancy consisted of the faculties of Law, Medicine, Mathematics, Natural Science, and Philosophy, and the School of Pharmacy. It also included the chemical, serotherapeutic, electrotechnic, and agriculture institutes and the "Études Coloniales." The attendance in 1902 was 1130. The library contains about 38,000 volumes.

NANDA DEVI, nān'da dā'vê. A peak of the Himalayas (q.v.).

NANDU, nān'dōō. The Brazilian name of the South American ostrich. See RHEA.

NANEK, nā'nāk, or **NANAK**, nā'nāk (1469-1538). Founder of the religious sect of Sikhs (q.v.). He was born at the village of Talwandi, now called Nankana, on the bank of the river Ravi, near Lahore, India, and was a Kshatriya in caste. In his youth he showed a tendency toward mysticism. He was at first a shepherd, and afterwards became a Government official, in charge of the State's granary. He visited all the sacred places of India for the purposes of formulating the religious system he wished to introduce among his neighboring tribes. He spent two years in the town of Livanobhion, where he associated himself with Kabir, the founder of a monotheistic sect. It was due to the influence of Kabir, whom Nanek often quotes in his book, that he determined to found a similar sect. Having previously made pilgrimages to Mecca and Medina, he returned to India, where he compiled the great work known as the *Adi-Granth*. For many years he traveled widely, and proclaimed everywhere the doctrines of his new religion. He preached the abolition of caste, the unity of God, and the obligation to lead a pure life, and soon had a large following. Upon his death, which occurred at Kirtipur on the Ravi River, his disciple Lina (or Labona) assumed the leadership of the sect. Ten apostles, or 'gurus,' as they are termed, are traced from Nanek down to Govind Sinh in 1708, with whom the succession stopped.

NANGASAKI, nān'gā-sā'kê. A seaport of Japan. See NAGASAKI.

NANINI, nā-nē'nē, GIOVANNI MARIA (c.1540-1607). An Italian composer, born at Tivoli. He opened the first public school of music ever controlled by an Italian musician in Rome. The famous Palestrina and a nephew, Bernardino, were two of his assistants. He succeeded Palestrina as *maestro* at Santa Maria Maggiore in Rome, and in 1577 became a member of the Papal Choir. Three years before his death he was appointed *maestro di cappella* of the Sistine Chapel. A six-part motet, *Hodie Nobis Caelorum Rex*, composed by him, is sung annually on Christmas morning in the Sistine Chapel. Some of his most important works remain in MS. and are the private property of the Sistine Chapel and the Vatican Library. His printed works include motets, madrigals, canzonets, and church pieces, most of which examples are regarded as representing the best of the Palestrina period. He died at Rome.

NANKEEN' CLOTH. A fabric formerly imported extensively from China, and said to be the manufacture of Nanking; the color, a yellowish buff, being a favorite one. In the middle of the nineteenth century this material was much

used for clothing, especially for trousers. Lately nankeen has been largely superseded by ordinary cotton, artificially colored to imitate the genuine fabric.

NANKING' (Chin., Southern Capital.) The capital of the Province of Kiang-su, China, and seat of the viceroy for the three provinces of Kiang-su, Kiang-si, and Ngan-hwei. It is 194 miles northwest of Shanghai, near the Yang-tse River, latitude $32^{\circ} 40' N.$, longitude $118^{\circ} 47' E.$ (Map: China, E 5). It was made the capital of the Empire and called Nanking in 1368, but was the capital only until 1403. Its official name, given by the Manchu Dynasty, is Kiang-ning. It is an ancient city, having been the capital as far back as A.D. 317-582. It has been famous as a literary centre and for its fine arts, manufactures, and monuments. It was captured by the Tai-pings in 1853, who held it for more than a year. They destroyed the beautiful porcelain tower from fear of its geomantic influences, and so injured the city that it has not yet recovered fully. The first British treaty was signed in Nanking in 1842. Its present importance in part is from its military college, arsenal, and factories for the making of war material. It is a centre of missionary activity. The climate is exceedingly unhealthy. The population is variously estimated at from one-quarter to one-third of a million inhabitants. It was opened to foreign trade in 1899, but its commercial importance is insignificant, owing to the proximity of Chin-kiang (q.v.). In the vicinity are the famous Ming tombs.

NAN'-NING'. A treaty port of Southern China, in the Province of Kwang-si, situated at the head of navigation on the Yu-kiang River, 320 miles west by south of Canton (Map: China, C 6). It is one of the principal trading stations near the southern frontier, and lies on the route of the proposed railroad from Hanoi to Canton. Population, 40,000.

NANNINOSE (corruption of American Indian *mananosay*), or **MANNINOSE.** A local name in use along the South Atlantic coast for the soft clam (*Mya arenaria*). See CLAM.

NANSEN, nân'sen, FRIEDTJOF (1861—). A Norwegian Arctic explorer and naturalist, born near Christiania, Norway. He was educated in the university of his native city, and was trained as a zoölogist. In his twenty-first year he undertook a trip to East Greenland waters for zoölogical specimens; the same year he was appointed curator in the Natural History Museum at Bergen. He became known to the world as the first man to cross the ice cap of Greenland, an adventurous journey from the east to the west coast, undertaken in 1888, which he described in two volumes, *The First Crossing of Greenland* (1890). He spent the winter of 1888-89 among the West Greenland natives, which resulted in a volume on *Eskimo Life* (1893). After his return to Norway he was appointed curator in the Museum of Comparative Anatomy at the Christiania University. From his twenty-third year he was constantly planning for the great journey into the polar regions, upon which he did not embark till nine years later. He had unusual natural and acquired qualifications for the work, and his winter among the Eskimos was of inestimable value to him in his later experiences.

Nansen inferred, partly from the appearance

in Greenland of a pair of trousers which had been left upon the ice south of Siberia when the *Jeannette* was abandoned, partly from the presence in Greenland of driftwood from Siberia, and partly from the experience of other explorers, that a ship driven with the ice by prevailing winds might drift from above Siberia across the pole. The weight of Arctic authority did not support this plan; nevertheless, with the assistance of the Government and private citizens Nansen built and equipped the Arctic exploring vessel *Fram* (Forward), left Norway in 1893, skirted the north coasts of Europe and Asia, put into the polar pack ice near the New Siberia Islands on September 22, 1893, and drifted northwest till March 14, 1895. On that day, with a single companion, Lieutenant Johansen, he left the *Fram* frozen in the pack and started toward the Pole with dog sledges. On April 7, 1895, he reached latitude $86^{\circ} 4' N.$, within 272 statute miles of the North Pole, and 184 miles nearer to it than any man had ever been before him. Further progress was impossible, and he retreated to Franz Josef Land, where he and Johansen spent the winter in a snow hut, living on Arctic game. In the spring they started southward for Spitzbergen, but fortunately found the winter camp of the Harmsworth expedition under Jackson, and returned home on the ship of that party in the summer of 1896. Meanwhile the *Fram* drifted around to the north of the Franz Josef Land Archipelago, reaching the latitude of $85^{\circ} 57'$, then "blasted her way southward to open water, and reached the coast of Europe within a week of Nansen's arrival there. The scientific results of the expedition were very great, and were published in a series of reports. Nansen also wrote *Farthest North*, a popular description of the expedition. His achievements were recognized by many geographical societies, which conferred their highest honors upon the explorer. He made extensive lecture tours in Europe and the United States.

Nansen failed to find any form of life above the 84th parallel. His discovery of a wide sea of oceanic depth, north of the New Siberia Islands, overthrew the theory of the prevailing shallowness of the Arctic Ocean. He found that, owing to the predominance of water in the far North, the temperatures there were higher than along the north coast of Asia. He discovered no land except a few little islands near the Asian coast; and the free movement of the ice masses driven, as Nansen observed, by the winds in every direction, has led geographers to conclude that there is no large land near the North Pole. See POLAR RESEARCH.

NANTEL', GUILLAUME ALPHONSE (1852—). A Canadian advocate, journalist, and politician, born at Saint Jérôme, Quebec. He was educated at Sainte Thérèse de Blainville, was admitted to the bar, and after several years of practice established at Saint Jérôme the colonization newspaper *Le Nord*, whose publication he continued until 1887. From 1887 to 1892 he was editor of *La Presse* at Montreal, and in 1897 established the weekly journal *Le Monde Canadien*. In 1882 he was returned by Terrebonne to the Quebec Assembly, and in 1886, 1890 and 1892 was reelected by acclamation. From 1891 to 1896 he was Minister of Public Works. He became a director of the Great Northern Railway and of the Northern Colonization Railway, and published in the in-

terests of colonization *Notre nord-ouest provincial* (1888).

NANTERRE, nân'târ'. A town of France in the Department of Seine, situated a few miles north of Paris, near Saint Denis. According to the tradition, it is the birthplace of Sainte Geneviève, the patron saint of Paris. Population, in 1901, 9214; of commune, 14,140.

NANTES, nânt. An important seaport town, capital of the Department of Loire-Inférieure, France, situated on the right bank of the Loire, at its confluence with the Erdre and the Sèvre-Nantaise, both navigable streams (Map: France, E 4). It is about 250 miles by rail southwest of Paris. Besides railways, there is communication with the interior by steamers on the Loire. The city is handsome and well built. Among the numerous striking and beautiful buildings, the chief are the Cathedral of Saint Pierre and the old castle, dating from 938. The Bourse is a modern building and one of the finest in France. There are a public library containing 200,000 volumes, a museum of paintings, a museum of natural history, an ecclesiastical college, several learned societies, and three theatres. A very beautiful promenade, formed by the Cours Saint Pierre and the Cours Saint André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. On the right bank of the river there are six miles of quays. Formerly vessels of 200 tons only could reach the port, vessels of greater burden unloading at Paimbœuf, or Saint-Nazaire, but a ship canal on the left bank now admits large sailing vessels and steamers directly to Nantes. In the manufacture of sugar Nantes stands next to Paris and Marseilles. Its ship-building industry and its tobacco factories are also very important. There are also iron, copper, and lead foundries, oil and soap works, food-preserving establishments, saw mills, and manufactures of railroad material, of cotton and woolen goods, chemicals, and cement.

Nantes, anciently *Condivincum*, was founded before the Roman conquest. It took its present name from that of a Gallic tribe, the *Namnetes*. It was the capital of the Duchy of Brittany, and its history until the fifteenth century is a record of struggles with successive invaders in defense of its independence. In 1491 the duchy was united to France by the marriage in the castle of Anne of Brittany to Charles VIII., King of France. The castle also witnessed the signing of the famous Edict of Nantes (q.v.) by Henry IV. in 1598. From the fifteenth century the commerce of the town began to have a great development, and in the seventeenth and eighteenth centuries its prosperity increased on account of the slave trade, but in 1790 Nantes had declined greatly in importance. During the Revolution it was the scene of the *noyades* and other atrocities of the infamous Carrier (q.v.). The population, which showed a falling off in 1880 and in 1890, in the last decade advanced again, and in 1901 Nantes had 132,990 inhabitants. Consult Maillard, *Nantes et le département au XIXème siècle* (Nantes, 1896).

NANTES, EDICT OF. The name given to the famous decree signed in the city of Nantes by Henry IV. of France, April 13, 1598, which secured to the Protestant portion of his subjects

partial freedom of religion. The document consisted of ninety-two patent or public articles and fifty-six secret or close ones, and among its chief provisions were the following: the proclamation of a full amnesty; the granting of liberty of conscience to the Huguenots; the permitting to Huguenot chiefs and noblemen of public religious exercises attended by themselves, their families, and the families of their dependents. In addition the Huguenots were to be allowed to establish new churches, except in Paris and the surrounding districts, and in the royal residences; and to maintain universities, or theological colleges, of which the Huguenots had four, those at Montauban, Saumur, Montpellier, and Sedan. Adherents of the reformed faith were also to be eligible to all civil offices and dignities; but they were obliged outwardly to celebrate the festivals of the Catholic Church, and to pay tithes to the Catholic priesthood. In each Parlement a *chambre de l'édit* was created to take cognizance of all cases arising out of the act and to supervise its working. Owing to the difficulties and delays in registering the Edict of Nantes, it was not published until a year after it had been signed by the King. It remained in force until revoked by Louis XIV., October 22, 1685. See HUGUENOTS.

NANTEUIL, nân'té'y, ROBERT (1630-78). A celebrated French engraver, born at Rheims. He studied in his native city under Nicolas Regneson. About 1645 he went to Paris, and there worked in crayon and pastel for some time before he took up the graver again. His plates having come to the King's notice, he was appointed designer of the Cabinet (1658). He is credited with the decree of 1660, dated from Saint Jean de Luz, by which engraving was raised to an equality with painting and set apart from the purely mechanic arts. He left about three hundred plates, which include portraits of many of the celebrities of the time. Consult Duplessis, *Histoire de la gravure en France* (Paris, 1861).

NAN'TICOKE. A former important Algonquian tribe of Maryland. They were noted for their dark complexion and peculiar customs and ceremonies, from which they acquired the reputation of being a tribe of sorcerers. Their power was broken by the Iroquois in 1678. In 1707 they had seven villages, and in 1722 their principal village still contained about one hundred inhabitants and was the seat of an 'empress,' who ruled over all the neighboring Indians. The whole tribe then numbered about 500. Soon afterwards they began a gradual removal to the Iroquois country, and settled in several villages on the eastern branch of the Susquehanna, in southern New York, although a portion of them continued to reside in their old country. In 1753 a part of those on the Susquehanna became incorporated with the Iroquois, but the majority removed to the Ohio and joined the Delaware tribe, with which they became completely merged. There are still several score of mixed-blood Nanticoke in southern Delaware.

NAN'TICOKE. A borough in Luzerne County, Pa., eight miles west-southwest of Wilkes-barre; on the Susquehanna River, and on the Pennsylvania, the Lackawanna, and the Central of New Jersey railroads (Map: Pennsylvania, E 2). It is chiefly engaged in mining and pre-

paring for market anthracite coal, but has also hosiery mills, a canning factory, etc. Settled in 1850-55, Nanticoke was incorporated in 1874; it is governed under the charter of that date, which provides for a Burgess, elected every three years, and a unicameral council. Population, in 1890, 10,044; in 1900, 12,116.

NANTUCKET. A town and the county-seat of Nantucket County, Mass., co-extensive with Nantucket Island and several small outlying islands; 60 miles southeast of New Bedford, with which it has steamboat communication (Map: Massachusetts, G 5). Nantucket is widely noted as a summer resort, presenting much of picturesque and historic interest. It was formerly the seat of a great whaling industry, but at present the community is engaged principally in fishing, agriculture, and the coast-wise trade. The town, including within its corporate limits several villages, contains the Athenæum (public library), Admiral Sir Isaac Coffin's Lancastrian School, and Muskeget Park. The government is administered by town meetings. Population, in 1890, 3268; in 1900, 3006.

In 1659 the first settlers, headed by Thomas Macy, came to the island and settled at Madaket, the present site of Nantucket not having been chosen until 1673. Consult Hinchman, *Early Settlers of Nantucket, Their Associates, and Their Descendants* (Philadelphia, 1901).

NANTWICH, nânt'ich. A market-town in Cheshire, England, on the Weaver, 20 miles southeast of Chester (Map: England, D 3). The parish church, one of the finest country churches in England, was restored in 1864. Nantwich was famous in former times for its brine-springs and salt-works. Shoes, gloves, cotton goods, and ale are manufactured. The town owns its water supply and markets. Nantwich dates from the Roman period, and was formerly called Halen Gwyn—the white salt town. Population, in 1891, 7400; in 1901, 7700.

NANTYGLO, nânt'f-glo, and **BLAINA,** blâ'na. A town in Monmouthshire, England, 7½ miles southwest of Abergavenny (Map: England, C 5). It has important coal-mining and iron industries. Population, in 1891, 12,400; in 1901, 13,500.

NAOGEORG, nâ'ô-gâ-ôrg', THOMAS (1511-63). A German Protestant dramatist, whose name in the vernacular was Kirchmeyer. He was born at Hubelschmeiss, near Straubing; possibly studied at Tübingen; and in 1535 became pastor. His Latin poems, all animated by the most bitter opposition to the Papacy, include the dramas, *Pammachius* (1538); *Incendia seu Pyrgopolinices* (1541); *Mercator seu Indicius* (1541); and the satiric poem *Regnum Papisticum* (1553). These were often rendered into German, and were long popular, as were his weaker biblical dramas, *Hamanus* (1543); *Hieremias* (1551); and *Judas Iscariotes* (1551).

NAOROJI, nou'rô-jê, DADABHAI (1825—). The first Indian member of the British House of Commons. The son of a Parsi priest, he was born at Bombay, and educated in the school of that city which afterwards became the Elphinstone Institution. He was appointed professor of mathematics and of natural philosophy there in 1854, but after 1855 he lived chiefly in England. He was instrumental in founding the East India Association in 1867, and three years after-

wards he succeeded in having certain positions in the civil service opened to native Indians. In 1874 he was made Prime Minister to the Prince of Baroda. From 1885 to 1887 he was a member of the Bombay Legislature, and he was president of the Indian National Congress in 1886 and in 1893. He was a liberal member of Parliament for Central Finsbury in 1892-95, and in 1895 was appointed a member of the royal commission to inquire into Indian affairs. His publications include: *England's Duties to India* (1867); *The Wants and Means of India* (1870); collected articles published in 1887; and *Poverty and Un-British Rule in India* (1901).

NA'OS (Gk. *vab*, Attic *reûs*, from *valer*, *naiein*, to dwell). The central chamber of a Greek or Græco-Roman temple. See **CELLA**; **PRO-NAOS**.

NAPA, nâ'pâ. A city and the county-seat of Napa County, Cal., 46 miles northeast of San Francisco; on the navigable Napa River, and on the Southern Pacific Railroad (Map: California, B 2). It is the seat of a State Hospital for the Insane, and has attractions of beautiful scenery and special features of interest in Napa Soda Springs, Napa Redwoods, Calistoga Hot Springs, and petrified forests. The leading industries are fruit-growing and the manufacture of tanned leather, shoes, gloves, and woolen goods. At Napa Junction there are Portland cement works, the vicinity having extensive deposits of cement rock. Settled in 1847, Napa was incorporated in 1863. The present government is administered under a charter of 1893, which provides for a mayor, elected every two years, and a unicameral council. Population, in 1890, 4395; in 1900, 4036.

NAP'ANEE. A town and port of entry, Lennox County, Ontario, Canada, at the mouth of the Napanee River, on the Bay of Quinté, 23 miles west of Kingston. It has a station on the Grand Trunk Railway and is the terminus of the Bay of Quinté and Napanee Railway. It is a grain-trading centre and the seat of a United States consular agent. Population, in 1891, 3433; in 1901, 3143.

NAPATA, nâ-pâ'tâ. The ancient capital of Ethiopia (q.v.), mentioned in inscriptions as early as B.C. 1450, and later the seat of independent kings. It was rivalled by Meroë (q.v.) after the Persian period. For the ruins of the city, destroyed by Petronius, see **BARKAL**.

NA'PERVILLE. A city in DuPage County, Ill., 30 miles west of Chicago; on the DuPage River, and on the Chicago, Burlington and Quincy Railroad (Map: Illinois, D 2). The city, chiefly a residential place, has the Nichols Library, and is the seat of Northwestern College (Evangelical Association), established in 1861. There are quarries, a furniture factory, and a fly-net factory. The electric-light plant is owned and operated by the municipality. Naperville was settled in 1830, and was incorporated in 1857. Population, in 1890, 2216; in 1900, 2629.

NAPH'TALI. According to Gen. xxx. 7-8, the fifth son of Jacob, and the second born to him by Bilhah. In the actual history of the Hebrew Confederation, the tribe Naphtali plays but a minor part. Its territory lay in the north, bordering on the Sea of Galilee. According to Judges iv. 6, Barak came from Kedesh in Naph-

tali, but it is doubtful whether the addition 'Naphtali' is correct here, though both the clans Naphtali and Zebulon were involved in the struggle against the King of Hazor. (See DEBORAH.) According to Josephus (Wars, iii. 3, 2) the Naphtalites were men of valor. Their dangerous position as a border tribe made them among the first to fall into the hands of Assyria (B.C. 734; cf. II. Kings xv. 29). In the religious development of Israel the tribe plays no part, but in the post-exile period Tiberias (q.v.), on the western shore of the Sea of Galilee, comes into prominence, and after the destruction of Jerusalem it became one of the centres of Jewish learning.

NAPHTHA (Lat., from Median Pers. *nāp̄θa*, Av. *nāp̄ta*, Pers. *naft*, moist; connected with Lat. *Neptunus*, *Neptune*, name of the sea-god). A term originally applied to an inflammable liquid which exudes from the soil in certain parts of Persia. Subsequently the use of the term spread to include some of the more volatile oils found in Europe and even in America. The product of the oil fields of Southern Russia is usually called naphtha, although it differs in no way from the ordinary grades of petroleum. Naphtha properly includes the lighter oils which pass off first in the distillation of petroleum, the gravities ranging from 90 to 62 degrees Beaumé. Pennsylvania crude oil contains from 8 to 20 per cent. of naphtha. In the refining of such naphtha several products are obtained by fractional distillation, those which pass off first, namely rhigolene and cymogene, are gases at ordinary temperatures and are seldom saved. The next product is known as gasoline, a material largely used in machines and for illuminating purposes. After this come stove naphtha and gas naphtha, the latter being the base of much of the illuminating gas now made. Petroleum naphtha is often treated with chemicals to deodorize it. Naphtha may also be obtained in the distillation of wood and coal tar. See PETROLEUM.

NAPHTHALENE (from *naphtha* + *alcohol*), $C_{10}H_8$. A crystalline solid chemical compound of carbon and hydrogen, found abundantly in coal-tar (q.v.). The crystalline mass obtained from this source is pressed, warmed with a little strong sulphuric acid, and then distilled in a current of steam or subjected to a process of sublimation. When thus obtained in the pure state, naphthalene melts at $80^{\circ} C.$ ($176^{\circ} F.$), and boils at $218^{\circ} C.$ ($424^{\circ} F.$). It has a peculiar characteristic odor, is insoluble in water, but freely soluble in ether and in hot alcohol. It is largely used in the manufacture of coloring substances and to some extent also as an enricher for ordinary illuminating gas. The molecule of naphthalene is composed of two rings of carbon atoms, with hydrogen atoms attached to them, and its constitution is represented by either of the following graphic formulas:

A number of interesting derivatives of this hydrocarbon are obtained by the action on

naphthalene of chlorine, nitric acid, etc. The most important derivatives commercially are the so-called sulphonic acids. By acting on naphthalene with an excess of sulphuric acid, we obtain naphthalene-sulphonic acid, $C_{10}H_7SO_3H + H_2O$, from which, by substitution processes, a large number of compounds are produced, many of these finding employment in the color and dye industry.

NAPIER, *nā'pl-ēr*. The capital and chief port of Hawke's Bay County and Provincial District, North Island, New Zealand, on the east coast (Map: New Zealand, F 3). Wool is the chief export; there are also large exports of timber, canned and frozen meats. The principal public buildings comprise an Anglican cathedral, town hall, and athensium. It has railway communication with Wellington and New Plymouth. Population, in 1901, 9015.

NAPIER, *nāp'yēr* or *nā-pēr'*, Sir CHARLES (1786-1860). A British admiral. His father was the Hon. Capt. Charles Napier, R. N., second son of Francis, fifth Lord Napier. He was born at the family seat, Merchiston Hall, Stirling, Scotland. At thirteen he went to sea as a naval volunteer. In 1808 he received the command of the *Recruit*, 18 guns, serving in the West Indies. He became a post-captain, but being thrown out of active service, volunteered in the Peninsular Army, and was wounded at Busaco. In 1814 he was ordered to America, and took an active part in the operations against Baltimore. In 1829 he received the command of the *Galatea*, a 42-gun frigate, and was employed 'on particular service' on the coast of Portugal. He accepted the command of the fleet of Dom Pedro, the father of the young Queen, Maria da Gloria, in the struggle against her uncle, Dom Miguel, and by defeating the Miguelite fleet, hastened the downfall of the usurper. He was made admiral-in-chief of the Portuguese navy, but soon returned to England. In the war between the Porte and Mehemet Ali, he organized a land force, with which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre. He next blockaded Alexandria, and concluded a convention with Mehemet Ali. For these services he was knighted, and in 1847 he received the command of the Channel Fleet. When the Russian War broke out, he was sent out to command the Baltic fleet, but had to content himself with a prudent and successful blockade of the strongly fortified ports, which somewhat disappointed public expectations of more daring achievements. He twice sat in Parliament, and, until his death, labored with success to reform the British naval administration. He was a man of great personal courage and decision of character, but selfish, vainglorious, and arrogant. These traits are strongly marked in his works: *The War in Portugal* (1836); *The War in Syria* (1842); *The Navy: Its Past and Present State* (1851). Partiality marks the biography by his stepson Gen. Elers Napier, *The Life and Correspondence of Admiral Sir Charles Napier* (London, 1862).

NAPIER, Sir CHARLES JAMES (1782-1853). A celebrated British general, son of Col. George Napier. He was born at Whitehall, August 10, 1782, and in his twelfth year received a commission in the Thirty-third Infantry. His first mili-

tary experience was in Ireland in 1798. His next active service was in Spain during the Napoleonic wars, and he commanded the Fiftieth Infantry at Coruña, where he was wounded and taken prisoner. Marshal Ney dismissed him on parole, and he went to England, but returned in 1810 to the Peninsula after having been exchanged. At Coa he fought as a volunteer and had two horses killed under him. At Busaco a shot in the face broke his jaw and injured an eye; but he recovered in time to be present at the battle of Fuentes de Oñoro and the second siege of Badajoz, both in 1811. In the summer of 1813 he was with the fleet under Beckwith, and afterwards under Cockburn, engaged in desultory operations on the coast of the United States. In 1815 he took part in the storming of Cambrai, and marched into Paris with the allied armies. From 1822 to 1830 he was Resident (Governor) of Cephalonia, one of the Ionian Islands, the affairs of which he administered with great energy and intelligence. In 1841 he was ordered to India to take command of the army at Bombay. The most splendid service of his life now began, and resulted in the conquest of Sindh against great odds. In the battle of Miani, 1843, Napier with about 2000 troops attacked a strongly posted native force ten times as great, and defeated it, killing more than 6000 men. Thereupon all the ameeris surrendered with the exception of Shih Muhammed, who brought 25,000 men into line of battle at Hyderabad. In three hours Napier's little army of 5000 men gained a decisive victory, and a few days afterwards the English general was master of Sindh. The Governor-General, Lord Ellenborough, made him Governor of the conquered territory, but though his administration was very successful, as were also various campaigns against the hill tribes, Napier retired in 1847, after having quarreled with the directors of the East India Company. During the Sikh war of 1848-49 he again went to India, but arrived too late to take part in the conflict. After having put down a mutiny among the native soldiers, he returned to England in 1850, having had another quarrel with the directors. He retired to the Hampshire Downs, near Portsmouth, busying himself with literary labors. There he died on August 29, 1853. Napier was a man brave to rashness, quarrelsome with his superiors, but beloved by his soldiers, and one of the most remarkable of the military men of his time. Consult: Bruce, *Life of General Sir Charles Napier* (London, 1885); Butler, *Sir Charles Napier* (ib., 1890). His brother, Sir William Francis Patrick Napier (q.v.), has also written of him.

NAPIER, Sir FRANCIS (1819-98). An English diplomat, born at Thirlestane, in Selkirkshire. He entered the diplomatic service in 1840, was attaché at Vienna and at Constantinople, secretary of legation at Naples, envoy to Washington and The Hague, and ambassador to Saint Petersburg (1860-64) and to Berlin (1864-66). From Berlin he was transferred to India as Governor of Madras, and there labored incessantly and wisely, especially in behalf of public health during the famine in Ganjam. In 1872, after serving temporarily as Governor-General of India, he returned to England and was created Baron Ettrick of Ettrick.

NAPIER, JOHN (1550-1617). A Scotch mathematician, born at Merchiston, near Edinburgh. He was educated at Saint Andrews and probably also abroad. His natural pugnacity of character often involved him in difficulties with his neighbors and tenants. In 1594 he published his *Plaine Discovery of the Whole Revelation of Saint John* (2d ed., London, 1611), in which he sought to prove that the Pope was Antichrist. In somewhat the same spirit, ostensibly to defend his country from "the enemies of God and true religion," he made some secret inventions, including burning-mirrors, a piece of artillery, and a chariot of metal, none of which had any more merit than his theological contributions. Napier's fame rests on his mathematical discoveries, and he is chiefly known as the inventor of logarithms (q.v.). In his earlier investigations he seems to have been considering the subject of imaginary roots, and he refers to this as an important algebraic secret. The idea of logarithms seems to have occurred to him as early as 1594, and thenceforward the rest of his life was spent in developing the idea and computing logarithmic tables. He also invented some mechanical devices for computation known as 'Napier's rods.' (See CALCULATING MACHINES.) By means of these, multiplication and division can be performed, and square and cube roots extracted. He was also the inventor of a number of formulas in trigonometry, known as 'Napier's circular parts.' (See CIRCULAR PARTS.) Napier was one of the first English writers to make any valuable contribution to mathematics, and his discoveries mark an epoch in the history of science. His chief writings are: *De Arte Logistica* (written in 1573, published in 1839); *Mirifici Logarithmorum Canonis Descriptio* (1614 and subsequent editions; Eng. trans., 1616 and 1857); *Mirifici Logarithmorum Canonis Constructio* (1619; Eng. trans. 1889); *Rabdologia seu Numerationis per Virgulas Libri Duo* (1617). Consult: Mark Napier, *Memoirs of Napier* (Edinburgh, 1793); Earl of Buchan, *Life of Napier* (ib., 1877). A complete edition of Napier's works appeared in Edinburgh in 1839. A bibliography of Napier's works, by Macdonald, may be found in the English translation of the *Mirifici Logarithmorum Canonis Constructio* mentioned above.

NAPIER, ROBERT (1791-1876). A Scotch marine engineer, born at Dumbarton. He was for a time apprenticed to his father, a blacksmith, and afterwards went to Glasgow, where in 1815, after working for Robert Stevenson, he set up a smithy, with two apprentices. In 1823 he built his first marine engine. In 1830 he supplied engines for the Glasgow Steam-Packet Company, and ten years later he supplied the Cunard Company with engines for their first four steamers. He added shipbuilding to the construction of engines in 1841, and built more than 300 vessels for the Government, and the larger companies.

NAPIER, ROBERT CORNELIS, Lord Napier of Magdala (1810-90). A British soldier, born at Colombo, Ceylon. He studied at the East India Company's military college at Addiscombe, and at the royal engineering school at Chatham, and from 1828 to 1845 was chiefly employed on the public works. In the latter year, however, he participated in several battles of the First Sikh War. During the Second Sikh War (1848-49) he again saw active service, and at its close was appointed

civil engineer to the board of administration of the Punjab, in which capacity he inaugurated and partly carried out a comprehensive scheme of public improvements. During the summer and fall of 1857, at the time of the Mutiny, Napier distinguished himself in the movements which resulted in the relief of Lucknow. Later he also planned the recapture of that place. In June, 1858, he coöperated with Sir Hugh Rose in the latter's operations against the insurgent forces under Tantia Topi and the Ranees of Jhansi; and on the 29th, after Sir Hugh's departure, he took the chief command in Central India. In August he coöperated with Brigadier-General Smith in the capture of Paori; in December, with slight loss to himself, destroyed Ferozeshah's army and in April, 1859, captured Raja Man Singh of Narwar and Tantia Topi. Subsequently he was appointed military member of the council of the Governor-General and aided in the amalgamation of the national army and that of the East India Company. Lord Elgin's (q.v.) sudden death left him Acting Governor-General for a short time. In 1868 he commanded the English expedition sent to Abyssinia and stormed the royal stronghold of Magdala. On his arrival in England Queen Victoria created him Baron of Magdala. The next year he was appointed commander-in-chief in India. Six years later he returned to Europe, and in 1883 was raised to the rank of field-marshal. Consult Markham, *History of the Abyssinian Expedition* (London, 1869), and Escott, *Pillars of the Empire* (London, 1879).

NAPIER, Sir WILLIAM FRANCIS PATRICK (1785-1860). An English general and historian, born at Celbridge, Kildare, Ireland, December 17, 1785. He was a brother of Sir Charles James Napier, the conqueror of Sindh, and a cousin of Sir Charles Napier, the English admiral. Entering the army as ensign in the Royal Irish Artillery (1800), he became captain of a regiment in Sir John Moore's brigade (1804); took part in the siege of Copenhagen (1807); went with his regiment to Spain (1808); and for his bravery in the Peninsular campaigns was appointed lieutenant-colonel (1813). Later he became colonel (1830); then Lieutenant-Governor of Guernsey (1842), and general (1859). He was knighted in 1848. Napier passed his last years at Scinde House, Clapham, where he died February 10, 1860. Napier gained an immense reputation by his *History of the Peninsular War* (6 vols., 1828-40). This work, which aimed to tell the truth, led to a long controversy with the officers who had taken part in the campaigns. It is, however, believed to be an impartial statement of facts. His *History of Sir Charles Napier's Administration of Scinde* (1851) is written in his boldest style. Consult the *Life* by Lord Aberdare (London, 1864).

NAPIER'S RODS, or BONES. See CALCULATING MACHINES.

NAPLES (It. *Napoli*; anciently, *Neapolis*). The largest city and the second seaport of Italy, capital of the Province of Naples, formerly the capital of the Kingdom of the Two Sicilies, situated on the western coast of the Peninsula, at the foot of encircling hills, on the north side of the Bay of Naples, in latitude 40° 51' N., and longitude 14° 16' E. (Map: Italy, J 7). It is about five miles long and three miles broad. The climate is

mild, although the variations in temperature and humidity, owing to alternating winds from the north and south, are often great and sudden. The thermometer ranges from 26° F. in January to 97° in July, the average winter temperature being 50°, the average summer temperature 75°. Fogs are rare and snow seldom falls. The rainy season lasts from the end of January to the beginning of April. The heat of summer is tempered by the sea wind that blows until about 2 o'clock in the afternoon. Vesuvius acts as a great natural barometer: when its smoke blows toward Capri, fair weather is always expected.

The far-famed situation of the city on the sea, amid its amphitheatre of hills, can be compared perhaps only with that of Constantinople. Across the bay to the south is visible the historic island of Capri; on the eastern shore are villas, vineyards, and orange groves grouped around tiny cities, while over all towers Vesuvius with ominous grandeur. The environs in general are unsurpassed for loveliness and the great variety of interest they present. Sorrento, Capri, Ischia, and the Phlegrean district are localities that delight the sightseer. Other striking attractions are the former monastery of the Camaldolites (q.v.), and the hill of Posilipo with its multiple associations and its fine streets offering magnificent views.

Architecturally Naples is by contrast surprisingly poor. The ancient and commercial part of the city lies east of a line drawn from Capodimonte through Sant' Elmo to Castello dell' Ovo, and is divided from north to south by the Via Roma.

The modern and western part, where are nearly all the principal hotels, is bordered on the south by the famous Riviera di Chiaia along the bay in a curved course of three miles. Here the Villa Nazionale stretches away—a splendid park dating from 1780. It is embellished with lordly allées, statues, and miniature temples. It contains the well-known aquarium of Naples, which is filled with a great variety of extraordinary fish—frutti di mare. It is, in fact, a school established for the scientific investigation of the aquatic fauna and flora of the Mediterranean. The public squares or larghi of Naples are adorned with fountains and obelisks; and within the precincts of the city are several highly prized springs of fresh mineral waters.

The handsome Renaissance Porta Capuana is justly celebrated. The castles are numerous. Among the principal ones are the Castello Nuovo, called the Bastille of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch erected in honor of Alfonso of Aragon; the Castello Sant' Elmo, commanding a magnificent view from the ramparts; and the historic egg-shaped Castello dell' Ovo. The last was begun in 1154. It is situated on an islet connected with the mainland, and is one of the conspicuous features. Near it is the street Santa Lucia—the centre of the noisy Neapolitan life, particularly of the lower classes. Women engaged in domestic duties, naked children, and peddlers of all sorts present a unique spectacle here in a city characterized by festivals and processions and bustling traffic. The neighboring royal palace is of modern construction. It has an imposing façade decorated with rich statues. The interior is uninteresting.

Of the nearly four hundred churches none is very striking. The cathedral, dedicated to Saint Januarius, contains the celebrated vials in which the liquefaction of the saint's blood is alleged to take place on three annual festivals. The church also contains the tombs of Charles of Anjou and Pope Innocent IV., besides numerous fine paintings and statues. San Martino is an interesting religious precinct, with its belvedere, cloisters, and museum. In the monastery attached to the Church of Santi Severino e Sosio are deposited the valuable archives of the former Neapolitan kingdom, consisting of some 40,000 manuscripts, the earliest dating from 703.

Naples is far richer in archæological than in architectural interest. The Museo Nazionale contains an immense and unsurpassed collection of frescoes, paintings, mosaics, sculptures, antiquities, coins, medals, and inscriptions, including objects excavated at Herculaneum and Pompeii. Among its rarest, most celebrated possessions are the Farnese Bull, the Farnese Hercules, the Mosaic of the Battle of Alexander, the Pompeian frescoes, and a valuable collection of bronzes and vases.

The splendid Galleria Umberto Primo was completed in 1890 at great expense.

At the head of the educational system is the university (q.v.). There are also an engineering school, an Oriental institute, an astronomical observatory, a botanical garden, several unions for the study and diffusion of many leading branches of knowledge, a marine school, and a royal conservatory of music. The charitable institutions are numerous, on an extensive scale, and richly endowed. Besides that of the university there is the National Library, with over 350,000 volumes, 200,000 pamphlets, and about 8000 manuscripts. Naples has many good playhouses. The San Carlos is one of the largest and most famous of opera houses. The marionette theatres and the theatres where the famous Neapolitan Pulcinella is to be seen are a never-failing source of entertainment.

Naples is one of the most important manufacturing centres in Italy. Ships, locomotives and cars, and stationary engines are built; and glass, cotton, wool, gloves, perfumery, linen and silk products are manufactured. The extensive steel works are chiefly in the hands of English firms. Copies of ancient vases and bronzes, lava articles, and coral and tortoise-shell goods are also largely dealt in. The commerce of Naples is even more important than are its industries. It has regular communication by steamers with nearly all parts of the world. The harbor has been much improved in the last decade. The tonnage of vessels entering was 3,356,435 in 1900, an increase of nearly 1,700,000 tons during the decade. The chief articles of import are coal, iron and steel (Great Britain, Germany, and Belgium), grain (Russia and India), lumber (Austria-Hungary), cotton (United States and India), wool, leather, oils, and wines (France), and chemicals (Germany and Great Britain). The leading exports are wine and brandy, dried and sub-tropical fruits, nuts, paper, and hemp. The total value of the imports in 1900 was \$11,594,567, showing an increase of nearly \$2,800,000 since 1898. The exports for 1900 were valued at \$20,916,631.

Half of the population of Naples, including

the countless *lazzaroni* and *trovatori*, were huddled together in the slums in ancient unsanitary buildings that crowded narrow, crooked streets, until the cholera epidemic of 1884 aroused the whole country. In 1885 the Italian Parliament voted \$20,000,000 toward a systematic renovation which, when entirely completed, will cost city and nation not less than \$100,000,000. A new water supply was at once introduced from the mountains near Avellino, 50 miles away, and plans were elaborated for a new sewer system, for new streets, new squares, and new buildings. Of 271 old streets 144 were to be abolished and 127 widened; the habitations of 90,000 people were to be destroyed, and the density of the population reduced from 645 to 280 per acre. The work so far has been done on contract by private companies, and the resale of street frontage on the new business streets has to some extent reimbursed the Government. The water-works are owned by a private company. The population of Naples in 1901 was 563,731.

Consult: Colletta, *History of the Kingdom of Naples*, translated by Horner (Edinburgh, 1858); Beloch, *Kampanien. Geschichte und Topographie des antiken Neapel* (2d ed., Berlin, 1890); Del Balzo, *Napoli e i Napolitani* (Milan, 1884); Forbes, *Rambles in Naples* (New York, 1886); Hare, *Cities of Southern Italy* (London, 1883); Waters, *Naples* (Boston, 1894); Pellet, *Naples contemporain* (Paris, 1894); Rolfe, *Naples in the Nineties* (London, 1897); Whitehouse, *The Collapse of the Kingdom of Naples* (New York, 1899); Norway, *Naples Past and Present* (New York, 1901); Rispoli, *La provincia e la città di Napoli* (Naples, 1902).

NAPLES, BAY OF. A bay of the Mediterranean Sea on the southwest coast of Italy (Map: Italy, J 7). It is 20 miles wide from Cape Miseno on the northwest to Point Campanella on the southeast, and extends inward about 10 miles. The bay is famous for its beautiful scenery, the view including the city of Naples, Castellamare, and the other towns and villages along the shores, dominated by Mount Vesuvius on the east, while at the entrance to the bay are the lovely islands of Ischia and Capri.

NAPLES, KINGDOM OF. See TWO SICILIES, KINGDOM OF THE.

NAPLES, UNIVERSITY OF. An Italian university, founded in 1224 by the Emperor Frederick II. It was reformed or reconstructed at least three times before 1266, when Charles I. of Anjou finally placed it on a sound footing. Among its earliest and most brilliant scholars was Thomas Aquinas, who lectured here during its short but brilliant revival about 1272-74. It was reorganized in 1780, and since the incorporation of Naples with Italy, 1860, it has increased remarkably in numbers and influence. It had in 1901 a budget of over 900,000 lire and more than 5100 students, chiefly in law and medicine. Its library contains about 160,000 volumes and 30,000 pamphlets.

NAPO, nã'pô. A tributary of the Upper Amazon. It rises on the slope of Mount Cotopaxi in Ecuador and flows southeast, emptying into the Amazon near the eastern boundary of Ecuador after a course of 750 miles (Map: Ecuador, C 4). In its upper course it flows in a steep incline through a rough and rocky valley, but after emerging from the mountains it traverses a vast

NAPLES
VIEW OF THE CITY FROM THE TOMB OF VERGIL (UPPER)
PIAZZA DEL MUNICIPIO (LOWER)

forest-covered plain, almost unexplored, and sparsely inhabited by savages. The Napo is navigable for steamers nearly 400 miles, but the natural wealth of the region, including gold, sarsaparilla, and rubber, is but little exploited.

NAPOLEON. A village and the county-seat of Henry County, Ohio, 35 miles southwest of Toledo; on the Maumee River, the Miami and Erie Canal, and the Wabash and Detroit and Lima Northern railroads (Map: Ohio, B 3). It is of some importance as an industrial centre, its chief manufactured product being flour. The water-works and electric-light plant are owned by the municipality. Population, in 1890, 2764; in 1900, 3639.

NAPOLEON I., *Fr. pron. ná'pó'lá'ón'* (Napoleon Bonaparte) (1769-1821). Emperor of the French, born at Ajaccio, on the island of Corsica, August 15, 1769. The family of Buonaparte (as the name was spelled until 1796) was of Tuscan origin, but had been settled in Corsica since 1629. The parents of the future Emperor were Carlo Maria de Buonaparte and Letizia Ramolino, a descendant of a good Florentine family. Napoleon was the fourth child and the second son. After a few months spent in learning French in a school at Autun, he entered the military school at Brienne on April 23, 1779, and there remained until he was transferred to the great military school in Paris in September, 1784. Just a year later he received his commission as second lieutenant in La Fère Regiment of Artillery, which was stationed at Valence. He served with this regiment until 1791, but passed the greater part of his time (1786-88 and 1789-91) on furlough in Corsica, where he took part in the patriotic movement under Paoli. He was in Paris during the events of August 10, 1792, when the mob of Paris attacked the Tuileries, and on August 30th attained the rank of captain in the army. He returned to Corsica, but this time he had a falling out with Paoli and identified himself with the French Revolutionary Party on the island. The defeat of this party compelled Napoleon and the other members of his family to escape and take refuge in France in June, 1793. As yet Napoleon had shown little indication of his genius and of the mighty career he was destined to lead. Self-contained and gloomy, he had made scarcely any friends except Bourrienne. He had mastered his profession of arms, had shown a capacity for intrigue, and had learned to rely upon himself. In his long leisure hours he had devoted himself faithfully to books of a solid character. He was in the beginning an enthusiastic admirer of Rousseau, and his earliest writings, which date from the Valence period, reveal an amount of sentiment that is strangely unlike the man who later squandered human lives by the hundred thousand in order to gratify his ambition. Buonaparte rejoined his regiment in Southern France, participated in the occupation of Marseilles by the Revolutionary forces, and then marched to Toulon to take part in the siege of that town. As *chef de bataillon* in the Second Regiment of Artillery he was practically in charge of the artillery during the siege operations, and won for himself golden opinions from the commissioners of the Convention with the army. One of these commissioners was Robespierre's younger brother, Augustin, whose intimate friend and confidant Buonaparte now became. His conduct at Toulon won him promo-

tion to the rank of general of brigade, but his relations with the younger Robespierre and his outspoken Jacobinism caused his imprisonment after the coup of the 9th Thermidor. An old Corsican acquaintance, Saliceti, was one of the commissioners of the Convention in the south of France at this moment and intervened on behalf of the young artillery officer. Marmont, who was in position to help Buonaparte at this time, said that he did so because he saw "there was so much future in his mind." He was released on August 20, 1794, and after further misfortunes he turned up in Paris, where he found temporary employment in the topographical bureau.

The Convention was now drawing to a close, but was forced to face one more insurrection, one antagonistic to the new Constitution of the Year III. (See FRENCH REVOLUTION.) The work of defending the Convention was intrusted to Barras (q.v.), who selected as his second in command Buonaparte, whom he had seen at Toulon, and whom he now found in Paris half fed and shabbily clothed, awaiting the next turn of the wheel of fortune. "From the first," says Thiébault, "his activity was astonishing; he seemed to be everywhere at once: he surprised people by his laconic, clear, and prompt orders: everybody was struck by the vigor of his arrangements, and passed from admiration to confidence, and from confidence to enthusiasm." With the 'whiff of grape shot' he swept the Parisian mob from the streets on the 13th Vendémiaire (October 5, 1795). The Convention came to an end, the Directory took its place with Barras as one of the Directors, and Buonaparte succeeded Barras as commander of the Army of the Interior. Barras welcomed the young hero of the hour to his salon, where the grace of person and charm of manner of a young Creole widow, Josephine de Beauharnais, aroused in Buonaparte passionate admiration and love. Despite a disparity of six years in their ages, the influence of Barras brought about a marriage on March 9, 1796. Meanwhile the favor of another Director had brought to Buonaparte a much more important command in the army. Buonaparte had visited the Genoese Riviera in 1794, and at the Topographical Bureau he had taken the opportunity to prepare a plan of campaign in Northern Italy, which he now perfected and presented to Carnot (q.v.), who admired it and ordered its execution. Schérer, the general of the Army of Italy, replied that if the Directors wanted the plan carried out they could send down the man who devised it to do it. He was taken at his word; Buonaparte was appointed to the command, and left Paris two days after his marriage, arriving at Nice in March, 1796.

At this moment, after the treaties of Basel, France was still at war with England, Austria, and Sardinia. England was no longer a factor in the military situation on the Continent; Austria had been attacked only in Southern Germany, while on the Italian frontier France had done nothing except to make intermittent attacks on Sardinian territory. Italy was made up of patches of Austrian territory and of petty States under Austrian influence, which offered a rich spoil for the conqueror. The main body of the Austro-Sardinian army was at Montenotte, occupying the pass between the Maritime Alps and the Apennines at the headwaters of the Bormida and the Tanaro, two affluents of the Po. One

road followed the latter northwest to Turin, the other road followed the Bormida to the northeast to Milan; between the two was an almost impassable mountain country. A successful blow would compel the Sardinians to retreat on their capital, Turin, and the Austrians on Milan, their headquarters in Italy, without hope of reuniting their forces. This army of 52,000 men was somewhat scattered and could not be used in full force at any one point, and many of the men were sick. The French Army of Italy was no better off. There were 42,000 poorly equipped, worse clad, and unpaid men scattered in detachments along the Riviera from Nice to Savona. Their new commander, Buonaparte, was a slender, delicate-looking youth of twenty-six, who was known only for some skill shown in handling artillery at Toulon and in Paris. Rumor said he owed his appointment to a discreditable intrigue between Josephine and Barras. Certainly there was little to promise one of the greatest military campaigns in all history, the most dazzling success of modern times. Bonaparte (as he now spelled his name) from the moment of his arrival took hold of things with the grasp of an experienced general skilled in the management of men. His address to his army kindled their imagination: "Soldiers, you are half-starved and half-naked; the Government owes you much, but can do nothing for you. I am about to lead you into the most fertile valleys of the world; there you will find flourishing cities and teeming provinces; there you will reap honor, glory, and riches. Soldiers of the Army of Italy, will you lack courage?" Reinforcements arrived which raised the army to about 50,000 men, whom Bonaparte concentrated at Savona. The campaign opened at Montenotte on April 11th. Three successive attacks compelled the Sardinians under Colli to retreat toward Turin, while the Austrian commander, Beaulieu, fell back toward Milan. Bonaparte pressed on against Colli, and, though he had no power to negotiate, compelled him to sign the armistice of Cherasco (April 28th), which gave France military control of Piedmont and left Bonaparte free to attack Beaulieu. From this moment Bonaparte showed the Directory that they had no ordinary general to deal with. He did not wait for orders. He did things and then reported; he preferred no requests, but presented demands coupled with an ultimatum. Immediately after the signature of the armistice with Colli, Bonaparte reassembled his forces, which had scattered to forage and plunder, and prepared to attack Beaulieu, who had retreated across the Po and the Ticino. Beaulieu expected Bonaparte's attack near Pavia. The French commander turned his flank, seized Piacenza on May 7th, and compelled Beaulieu to retreat across the Adda, leaving Milan to the French. Bonaparte pursued the retreating Austrians and defeated them at the bridge of Lodi across the Adda, on May 10th. After this battle it is said the troops gave Bonaparte the endearing name of the Little Corporal; from this time they were thoroughly devoted to him. Bonaparte promptly occupied Milan and there displayed his characteristic qualities. He appealed to the popular enthusiasm, and led the Milanese to believe that he was their deliverer. He established a temporary administration, welcomed artists and writers, and showed an interest in the University of Pavia. On the other hand, he ex-

torted a war contribution of 20,000,000 francs and seized and sent to Paris numerous literary and art treasures. The young general did not dally. In a few days he was again pushing on against the Austrians, and on June 3d the siege of Mantua was begun. This strongly fortified town was the key to Northern Italy. While the siege was in progress Bonaparte paid his respects to the Dukes of Modena and Parma, to the Grand Duke of Tuscany, and to the Pope, each of whom he compelled to buy peace with large sums of money and with treasures of art and literature. The Austrians raised army after army for the relief of Mantua, but in vain. The first, under Wurmser, advanced from Tyrol in three divisions, and compelled the raising of the siege of Mantua by Bonaparte, who marched to meet the Austrians and defeated them at Castiglione on August 5th. Wurmser made a second attempt by the valley of the Brenta, but was defeated at Bassano on September 8th, and driven into Mantua, the siege of which was resumed by the French. Alvinczy, by the way of the Brenta, and Davidovich, by the way of the Adige, brought the second Austrian army into Italy, planning to concentrate 60,000 men at Verona. Bonaparte had to meet them with about 40,000, and at Caldiero, on November 12th, he met a severe check; but, driven to desperation, he put forth superhuman efforts, and after three days of fighting defeated the Austrians at the bridge of Arcole and forced them to retreat. Alvinczy, from the wreck of his army and with reinforcements, created the third Austrian army and advanced southward between Lake Garda and the Adige. Bonaparte hastened to meet him, seized the important strategic position at Rivoli, repulsed Alvinczy on January 14, 1797, and hurled him back into Tyrol. Turning back on Mantua, Bonaparte captured at La Favorita two days later an important detachment of Alvinczy's force which by a flank movement had almost succeeded in reaching Mantua. Wurmser surrendered Mantua on February 2d. In this famous campaign of 1796 Bonaparte relied on three important maxims to which he held fast throughout his career: divide for foraging, concentrate for fighting; unity of command is essential for success; and time is everything. Quickness to divine his enemy's plans; a thorough knowledge of geography which produced combinations that were executed with bewildering audacity; an ability to get a maximum amount of marching and fighting out of an army of young veterans who were poorly shod and clad and ill-fed; and the loyal support of his subordinates, Augereau, Masséna, Joubert, Lannes, Marmont, Victor, Murat, and Junot, combined to enable Bonaparte to conquer Northern Italy for France. The campaign of 1797 was an act of colossal audacity. With less than 50,000 men Bonaparte drove the Archduke Charles and the Austrians from Italy, forced the passes of the Alps in March, and pressed on directly for Vienna without waiting for Moreau (q.v.) to cooperate. At Leoben, within one hundred miles of Vienna, he signed preliminaries of peace with Austria on April 18th.

Bonaparte the conqueror began to take wider views of the part he was to play, and played it with a boldness and a skill that dazzled France into complaisance. He organized the Italian conquests into the Cisalpine Republic and con-

NAPOLEON I.
FROM AN ENGRAVING OF A PORTRAIT BY DAVID

stituted the Genoese dominions into the Ligurian Republic; he sent Augereau as his secret agent to conduct the military operations of the coup d'état of the 18th Fructidor (see FRENCH REVOLUTION); he lived and acted like a monarch in Northern Italy; and finally, disregarding the express orders of the Directors, he negotiated with Austria the Treaty of Campo Formio (October 17, 1797). Austria gave up her former Belgian possessions and Lombardy, and received most of the territories of the extinguished Republic of Venice. Bonaparte now returned to France, but the Directors were afraid of him and sought to rid themselves of him by dispatching him on some out-of-the-way or hazardous enterprise. It was evident to him that a direct attack upon France's one remaining foe, England, could not succeed, and he suggested instead the campaign in Egypt. The Oriental dream was always before his eyes, and throughout life influenced his policy. He saw in India the source of England's power, and he determined to attack India. He negotiated with Tipu Sultan, a determined foe of the English, and, as the easiest route to India was by the Red Sea, he proposed to conquer Egypt as a stepping-stone to India. An expedition was fitted out with the utmost secrecy at Toulon, and on May 19, 1798, he set sail with a large fleet carrying 35,000 men. He stopped on the way to capture Malta. On July 1st he landed in Egypt and occupied Alexandria on the next day. Advancing into the desert, he encountered and defeated the famous Mameluke cavalry in the battle of the Pyramids on July 21st, and three days later entered Cairo. Desaix was detached to conquer Upper Egypt, and Bonaparte devoted himself to consolidate his conquests. On August 1st-2d, however, Nelson destroyed his fleet in Abukir Bay, and Turkey declared war and planned to recover Egypt. Taking the offensive at the beginning of 1799, Bonaparte invaded Syria, captured Jaffa, and laid siege to Acre. Junot fought an engagement with the Turks near Nazareth, and Kléber found himself attacked by thirty thousand of them at the foot of Mount Tabor on April 15th, but was rescued by the opportune arrival of Bonaparte. Returning to Acre, Bonaparte found that he was unable to take the place by storm, and having lost five thousand men in fighting or from the plague, he ordered a retreat. Arriving in Egypt, he met another Turkish force, which had landed near Alexandria, and defeated it on July 25th. News from France told of the infidelity of Josephine, and of the evil plight of France under the decadent Directory, which was being attacked by the newly formed Second Coalition of the Powers of Europe against France. On the night of August 22d-23d, leaving Kléber in command, Bonaparte escaped from Alexandria, and evading the English ships, landed at Fréjus on October 9, 1799.

On reaching Paris he speedily took council with the members of his family and after a scene with Josephine forgave her, though he did not forget her offense. Councils with Talleyrand, Sieyès, and other important men of affairs followed, but most of all with his brother Lucien, who was now president of the Council of Five Hundred. Plans were speedily devised, and on November 9, 1799, the famous coup d'état of the 18th Brumaire took place. The Directory was overthrown, the Council of Five Hundred dispersed, and a provisional government composed of

Bonaparte and two of the late Directors, Sieyès and Roger Ducos, installed. Sieyès (q.v.) expected to be the managing head of the new combination, but at the first meeting found that Bonaparte had everything in his own hands. In a few weeks the Provisional Government drew up and promulgated the Constitution of the Year VIII., which, in spite of its elaborate provisions for the Legislature and the other parts of the Government, really intrusted all power to Bonaparte, who became First Consul (December 24, 1799). Having arranged the more important details of the administration and restored internal peace by the pacification of the Vendée, he turned his attention to the military situation. The victory of Masséna at Zurich on September 25-26, 1799, had freed France from the danger of invasion by the Second Coalition, but Italy and Southern Germany were once more in the hands of the Austrians, and Masséna with a French army was shut up in Genoa. Bonaparte suddenly and with the utmost secrecy gathered a new army for the invasion of Italy. Instead of taking the expected course of advancing along the Riviera as in 1796 and raising the siege of Genoa, he took his army, whose existence was unknown to the Austrians, across the Great Saint Bernard Pass and occupied Milan on June 2, 1800. The surprised Austrian General Melas endeavored to gather his forces and save himself. A detachment under Lannes defeated an Austrian detachment at Montebello on June 9th, but on the 14th Bonaparte found himself forced to face the main Austrian army of 31,000 men at Marengo with only 18,000, and with difficulty saved himself from complete defeat. The opportune arrival of Desaix after the battle was really over led to a renewal of the fight, to the astonishment of the Austrians, who were driven from the field. The campaign of Marengo was a masterpiece, but the honors of the victory itself belong to Desaix, who bought it with his life, and to Lannes, Bessières, and the younger Kellermann. Melas evacuated all of Italy west of Mantua, but Austria was not ready to make peace until she had been defeated by Moreau at Hohenlinden (q.v.) on December 3d, and Macdonald had crossed the Splügen and threatened Vienna. Negotiations were then opened between Cobenzl and Joseph Bonaparte, and on February 9, 1801, the Treaty of Lunéville was signed. England was now the only remaining foe of France. England forced the French to evacuate Egypt and captured Malta; while Bonaparte forced Naples and Portugal to abandon the English alliance. The faint-hearted Addington Ministry in England signed preliminaries of peace with France on October 1, 1801, and on March 27, 1802, Cornwallis and Joseph Bonaparte signed the Treaty of Amiens, which gave France complete peace for the first time in ten years. The diplomatic genius of Bonaparte shines brightly in these treaties, which enabled him to make real gains for France such as all the wars of Louis XIV. had failed to obtain. He carefully hid many things in these treaties for future use, which enabled him to appear as the pacificator and reorganizer not only of France, but of Europe, and as the founder of a great colonial empire. Seeds for future war were as carefully sown, which were to bring forth fruit at the appropriate season.

Bonaparte had shown himself the greatest master of the art of war, and one of the shrewdest of diplomats, when at thirty years of age he undertook the duties of a ruler, law-giver, and administrator. His greatness lay in the universality of his genius and in his inordinate capacity for hard work. Further, he was able to command the services of many men of extraordinary ability, and to make their work his own. His reorganization of the Government of France was accomplished in a few months and comprised enough achievements of the first order to have established the enduring fame of several statesmen. This tremendous activity so stirred and inspired his officials that they said "the gigantic entered into our very habits of thought." With Gaudin he reorganized the treasury department, regulated the assessment and collection of the taxes, and organized the Bank of France. With Chaptal he reorganized the local administration with the prefects and subprefects responsible to the central authority, the Council of State. The schism between the Catholic Church and the constitutional clergy was healed and the Catholic Church restored to its old-time place in France, by the negotiation of the Concordat (q.v.) with Pius VII. in 1801. The Lutherans, the Calvinists, and ultimately even the Jews were brought into similarly close relations with the State. The educational system was reconstructed, especially in the matter of secondary schools and of technical education. The work was completed by the establishment in 1808 of the University of France, which comprised the whole teaching force of the Empire. The establishment of the Legion of Honor in May, 1802, provided a means of recognizing services to the State. The greatest triumph was the codification of the laws of France. (See CODE NAPOLEON.) All these acts revealed Bonaparte as a master workman who deftly joined together in a perfect whole the many parts which numerous craftsmen had wrought out with difficulty in the days of the Revolution.

France had lost her colonial empire in the eighteenth century, and it was the fond hope of Bonaparte that he might restore it and thus rival England in commerce and upon the seas. To this end he began a series of enterprises which embraced every quarter of the globe—North and South America, Africa, India and the East, and Australia. He secured the cession of Louisiana from Spain, and sent an army to recover Haiti, where the blacks had successfully risen against their oppressors. In all these schemes he was checkmated by England, but on the Continent of Europe he was hindered by nothing more serious than protests in reaping the fruit of the wars of the French Revolution. He reconstituted upon the new French lines the Batavian Republic, the Cisalpine Republic (which became the Italian Republic), and the Ligurian Republic (1801-02). He extended the bounds of France, which already had the Rhine, the Pyrenees, and the Alps as her frontiers, by the unjustifiable annexation of Piedmont and Parma in 1802. He was actively concerned in the reorganization of Switzerland and of Germany in 1803. The Treaty of Aranjuez (March 21, 1801) bound Spain to France, while Portugal, the faithful ally of England, was humbled by the Treaty of Badajoz (September 29, 1801).

Bonaparte's colonial schemes were frustrated

by yellow fever, which destroyed General Leclerc and his army in Haiti and forced the Consul to sacrifice Louisiana to the United States (1803) and abandon his dream of empire beyond the seas. Pique at this disappointment hastened Bonaparte into the predetermined rupture with England. A *casus belli* was found in the question of Malta, which England refused to surrender in accordance with the terms of the Treaty of Amiens. Mortier occupied Hanover, of which George III. was King. Gen. Gouvion Saint-Cyr was ordered to occupy the Kingdom of Naples, an ally of England, to offset the occupation of Malta. The French army was mobilized in six divisions and stationed along the Channel from Ostend to Brest. War existed from May 16, 1803, but actual hostilities did not begin until over two years later. In the meantime England recalled Pitt to office (May, 1804). Pitt's great service consisted in securing allies and in forming the Third Coalition against France. In this work he was aided by Bonaparte's blunders, the most notable of which was the execution of the Duc d'Enghien (March 21, 1804), in retaliation for the Royalist plots of Pichegru and Georges Cadoudal. On the day of Pitt's return to power, Bonaparte was offered the title of Emperor by the French Senate, and on December 2, 1804, he was crowned Emperor as Napoleon I. at Paris in the presence of Pope Pius VII. On May 26th, 1805, he was crowned at Milan King of Italy. A few days later followed the last of his series of aggressions, which provoked Austria and Russia into the alliance with England, the annexation to France of the Ligurian Republic (June 4). A month later Russia and England signed their alliance against Napoleon, and on August 9th they were secretly joined by Austria. Sweden, Portugal, and Naples were practically, though not formally, parties to this coalition.

For two years Napoleon had been dallying with a scheme for the invasion of England. In the camps along the Channel he had organized, equipped, and drilled his famous Grand Army, composed largely of veterans of the wars of the Revolution, and at Boulogne special preparations had long been under way for an attack upon England. The summer of 1805 seemed the propitious time for the attack, and Napoleon made elaborate dispositions for obtaining naval control of the Channel and for the transportation of an army of 160,000 men from Boulogne to the Kentish coast. The French fleet under Villeneuve, however, was outmanœuvred and outfought by the English under Cornwallis, Calder, and Nelson. By the middle of August, 1805, the scheme had become impossible of execution. Napoleon, however, had foreseen this possibility; his other acts had already provided him with another chance to employ his army, and he had worked out in his mind the plan of his most brilliantly successful campaign, that of Austerlitz. On August 29th the Army of England was officially denominated the Grand Army and divided into seven corps under Bernadotte, Marmont, Davout, Soult, Lannes, Ney, and Augereau, with the cavalry under Murat, and the Imperial Guard under Bessières, in all about 220,000 men under the personal command of the Emperor, with Berthier as chief of staff. War was declared against Austria on September 25th, and the next day the movement of the

Grand Army into Southern Germany began. On the part of Austria, the Archduke Charles, with over 90,000 men, the best general and the largest army, was intrusted with operations in Italy, where 50,000 French troops were under the command of Masséna, while the smaller Austrian army under the command of the Archduke Ferdinand and General Mack, invaded Bavaria and occupied the untenable line of the Danube and the Iller with headquarters at Ulm. This move left Austria almost bare of troops. Making a feint at repeating Moreau's tactics of 1796 in attempting to turn Mack's left, Napoleon ordered the actual attack to be made on the right. Bernadotte and Marmont occupied Munich, Davout and Soult seized Augsburg, while Ney and Lannes occupied Günzburg and operated to the north of Ulm. Mack made three fruitless attempts to extricate himself, but after defeats at Wertingen, Memmingen, and Elchingen (October 14th), he was forced to capitulate with 33,000 men on October 20th. Though the Archduke Ferdinand escaped, Napoleon's forces were thus able to advance directly to Vienna, which he occupied on November 13th. The Russian forces which had been advancing to support Mack were forced to fall back into Bohemia, where the various divisions were united under the command of Kutusoff and joined by part of the Austrian forces. Napoleon marched northward to meet them, and on December 2d won his greatest victory, Austerlitz. The campaign of Ulm and Austerlitz was won by Napoleon's knowledge of the value of time, the whirlwind rapidity of his movements, and the precision of his combinations. The battle of Austerlitz was won by a masterly use of artillery. The vanquished Emperor Francis I. of Austria humbled himself before Napoleon in the Treaty of Pressburg (December 26th) and consented to large cessions of territory, including the former Venetian dominions, Tyrol (which was given to Bavaria), etc. The overthrow of Austria resulted in the formal dissolution of the old Holy Roman Empire (August 6, 1806).

What Austerlitz was for Napoleon on land, Trafalgar was for England on the sea. After a brief rest at home, Nelson had been ordered out to attack Villeneuve, who with the combined French and Spanish fleets sailed out of Cadiz and met Nelson off Cape Trafalgar. England's greatest sea-fighter won the greatest naval battle of the century, but lost his life (October 21, 1805). After this the French were able to do nothing at sea, and the ports of both France and her allies were generally blockaded by the English fleets. England was undisputed mistress of the seas, while Napoleon began to remake the map of Europe as though he were the undisputed master of the Continent. The most important changes during the year 1806 were the formation under his protection of the Confederation of the Rhine, the establishment of his brother Joseph as King of Naples, and of his brother Louis as King of Holland, and the creation of the Grand Duchy of Berg for his brother-in-law Murat. The death of Pitt (January 23, 1806) led to negotiations between Napoleon and Fox, the new Foreign Secretary. These negotiations, as well as those with Russia, came to naught, and to Napoleon's surprise this failure was coupled with the decision on the part of Frederick William III. of Prussia to make war upon him. Single-handed

Prussia undertook to meet Napoleon, who, as soon as he foresaw that war was inevitable, acted with the same vigor as in the previous year. The Prussian army under Prince Hohenlohe-Ingelfingen and Charles William Ferdinand, Duke of Brunswick, was drawn out in a line eighty-five miles in length, extending from Gera westward to the borders of Hesse-Cassel with the bulk at Erfurt. Napoleon left Paris on September 25th and assumed charge of the campaign at Würzburg on October 2d. On the 10th Prince Louis Ferdinand was defeated and slain in a skirmish at Saalfeld; on the 14th Napoleon surprised the Prussian army in its attempt to concentrate, and in person defeated Hohenlohe at Jena, while Davout defeated Brunswick at Auerstädt. Murat and Lannes pursued Hohenlohe and forced him to surrender at Prenzlau (October 28th), while the other remnants of the Prussian army and the fortresses surrendered without a blow. Saxony, which had acted as the ally of Prussia, went over to Napoleon, and later received as reward the Duchy of Warsaw. From the Prussian capital Napoleon issued the Berlin Decree, which, with the Milan Decree of 1807 and other decrees, was directed against English commerce. See CONTINENTAL SYSTEM.

Prussia, though vanquished, continued weakly the struggle in her eastern provinces, where Bannigsen and the Russians were ready to join in the contest. Murat occupied Warsaw, then Prussian territory, in November, 1806. In December Napoleon entered the ancient Polish capital and was greeted as the restorer of Polish liberties. The French having gone into winter quarters, Bannigsen hoped to surprise them and destroy them before they could again take the field, and accordingly attacked Ney and Bernadotte, but their successful resistance defeated the plan and Napoleon in person pursued Bannigsen, who retreated toward Königsberg and overtook him at Eylau (q.v.). The ensuing battle (February 7-8, 1807) was a butchery, not a victory. Napoleon hurried up reinforcements to renew the struggle in the spring. Sebastiani, the French Ambassador at Constantinople, persuaded the Sultan to declare war against Russia. Gardane was sent to stir up Persia to like action. Mortier induced the Swedes to treat with France. The campaign for Königsberg began early in June and was marked by the indecisive action of Heilsberg (June 10) and the defeat, four days later, of the Russians under Bannigsen at Friedland (q.v.). On June 25th the Czar and Napoleon held their famous conference of Tilsit (q.v.) on a raft moored in the Niemen. By the Treaty of Tilsit, Prussia was humbled even more than Austria had been at Pressburg, while the Czar became the ally of Napoleon and began to plan with him the division of the world between them.

Though England, under the Ministry of All the Talents, had behaved very badly toward Prussia and Russia, she remained the one steadfast foe of the French Emperor, and pursued without wavering her policy of opposition to Napoleon. At Tilsit Napoleon bound the Czar to enforce the Continental System against England, and then began the task of compelling all the lesser Powers to adhere to the system. There were to be no neutrals. Portugal, the constant ally of England, was the first victim. By the Treaty of Fontainebleau Napoleon joined with Spain to dismember that kingdom, and in November, 1807,

a French army under Junot occupied the country with little trouble, the royal family having already started for the New World to establish a temporary capital at Rio de Janeiro. The year 1808 witnessed the unfolding of Napoleon's designs against Spain. Gradually, in spite of all treaties, French troops were sent across the Pyrenees, where they quietly took possession of various fortresses. Spain was suffering from the family troubles of the Bourbon monarch, and it suited Napoleon's purpose to make use of them and to order the advance of a French army under Murat toward Madrid. This movement precipitated the fall of the Bourbons. Charles IV. was compelled by a popular uprising to abdicate in favor of his son, Ferdinand VII. (March), and a little later father and son, at a meeting with Napoleon at Bayonne, were forced to renounce the Spanish throne. On June 6, 1808, Joseph Bonaparte was proclaimed King of Spain. For an account of the struggle in Spain and Portugal, see *PENINSULAR WAR*.

In Austria Francis I. had called to office as his chief minister Count Philip Stadion, who, with the aid of Archduke Charles, devoted himself to the task of preparing Austria for another struggle with Napoleon. The misfortunes of Napoleon in Spain and the urgency of England, which offered liberal subsidies and active coöperation, determined the Austrians to try their fortunes once more in the spring of 1809. In April Archduke Charles opened the war by invading Bavaria, while another force under Archduke John invaded Italy. Napoleon reached the scene promptly and in the five days' fighting (April 19th-23d) around Ratisbon completely defeated the Austrian plan of campaign and forced Archduke Charles to retreat toward Vienna, which the victorious Emperor entered on May 13th. He then crossed the Danube and attacked the Archduke, who had taken up strong positions in the villages of Aspern and Essling. Two days of hard fighting (May 21st-22d) failed to give Napoleon any decided advantage, and he found himself and his army practically prisoners on the island of Lobau in the Danube. With his accustomed vigor he ordered up reinforcements and reorganized the troops under him. On July 5th Napoleon left the island of Lobau and on the 6th defeated the Archduke Charles in a great battle at Wagram. On October 14th was signed the Treaty of Schönbrunn (q.v.), by which Austria was forced to make large cessions of territory to the overbearing conqueror. From 1809 to 1812 the main strength of the French Empire was devoted to continuing the struggle in the Peninsula. A number of isolated events in other parts of Europe, however, made the period important. In pursuance of the Treaty of Tilsit, the Czar robbed Sweden of Finland (1808), and in the same year the French seized Swedish Pomerania. The next year the Swedish Kingdom was the scene of a revolution. Gustavus IV. was deposed and his uncle placed on the throne as Charles XIII. Marshal Bernadotte, the brother-in-law of Joseph Bonaparte, was elected heir to the childless monarchy and intrusted with the government of the kingdom. (See *CHARLES XIV.*) Denmark had likewise been marked to suffer on behalf of Napoleon's Continental System: but in this instance he was forestalled by England, which seized the Danish fleet in September, 1807. After the Treaty of Tilsit a kingdom of Westphalia was carved out

for Jerome Bonaparte in Germany, and numerous changes made in the Confederation of the Rhine. Napoleon enlarged his own empire by the annexation of Tuscany (1807), the Papal States (1809), Holland (1810), Valais, and the German coastline to Lübeck (1810). He also kept the Illyrian provinces, which had been wrested from Austria, for himself. Naples was transferred to Murat after the choice of Joseph as King of Spain. Pope Pius VII., the same pontiff who had consecrated Napoleon as Emperor in 1804, was carried away as a prisoner and kept in confinement. The new Cæsar must have an heir to his empire, and accordingly Josephine, to whom the Emperor was greatly attached, was divorced and a marriage arranged in 1810 with the Archduchess Maria Louisa of Austria, daughter of the Emperor Francis, who bore Napoleon one son, the King of Rome (1811). From Napoleon's policy England profited as much as did France, for the whole commerce of the seas was under her control and she had seized the colonies of France and all those of the countries under French control or influence that she saw fit. During the years from 1809 to 1815 England furnished the inspiration and the sinews of war for every campaign against Napoleon, but it was only in the Peninsula that she was directly responsible for the conduct of the campaign, which was carried on with desperation on both sides till the French were driven beyond the Pyrenees in 1814.

For three years after Wagram Napoleon did not in person conduct a single military operation. Family affairs and the administration of his great empire occupied all his attention. During these years many changes were taking place which presaged the downfall of the great conqueror. Austria was very cautiously strengthening her position under the skillful direction of Metternich. The regeneration of Prussia under Stein, Scharnhorst, and Hardenberg is one of the most notable events of the nineteenth century. Russia was never content with the French alliance, and the enforcement of the Continental System was causing great suffering and discontent, and the Czar Alexander was beginning to lose his enthusiastic admiration for Napoleon, who had offended him by concluding a matrimonial alliance with Austria without waiting for an answer to his request for the hand of a grand duchess in marriage, and, most of all, by the annexation of Oldenburg to France. The estrangement was increased by the Cæsarism of Napoleon, who could no longer endure the existence of even a friendly rival. Alexander, duly warned of Napoleon's intentions, turned to England and in 1812 entered into a close alliance with her. With Turkey he negotiated the Peace of Bucharest (May 28th), and with Sweden not only peace, but alliance (April 5th). Napoleon left Paris early in May, and went direct to Dresden, where he took care to bind Prussia, Austria, and the other German States more closely to his cause. Then he entered Poland, where he regulated the internal affairs and supervised the mobilization of his army. On June 22d he issued a declaration of war against Russia. The passage of the Niemen was begun on June 24th, and by the end of the month Napoleon had 400,000 men across the Russian frontier. The Czar had between 250,000 and 300,000 men under arms, but only about one-half of this number ready to face Napoleon under Barclay de Tolly and Bagration, who conducted a Fa-

bian campaign. Napoleon found the country devastated and abandoned as he advanced, with no enemy to make a stand against him. Like Charles XII., a century earlier, he was being lured to his ruin. At Smolensk (August 17th-18th) the French encountered the first serious resistance. Napoleon as he advanced had to leave large bodies of troops along his line of march, and he detached a large force to the northward to capture Mitau and Riga and threaten Saint Petersburg. Russian discontent became pronounced as the people saw Barclay de Tolly and Bagration permitting Napoleon to advance unresisted on their ancient capital, Moscow. The two generals allowed themselves to be superseded by Kutusoff, who chose his ground, and on September 7th offered battle to the French at Borodino (q.v.). It was the bloodiest battle of the century, the losses probably aggregating 40,000 on each side. The loss to Napoleon, who could obtain no reinforcements, was fatal, but still he pressed on and entered Moscow (September 14th) only to find himself robbed of the fruit of victory by the terrible conflagration which broke out two days later. With a folly that seemed madness, Napoleon lingered in the city until October 19th before beginning the retreat. The hard-fought drawn battle of Malo-Yaroslavitz (October 24th) compelled Napoleon to retreat by the same desert road on which he had advanced, instead of by a more southerly route through country not yet devastated by war. Sufferings from the cold and from lack of food were intensified by the constant presence of the Russians on the flanks and in the rear. The expected supplies were not found at Smolensk, and the sufferings of the French reached their terrible climax at the crossing of the Beresina (November 26th-28th), where thousands perished in spite of the heroic efforts of Oudinot and Ney. A week later Napoleon turned over the command to Murat and hastened to reach Paris and organize a new army before the news of the great disaster should become known in Western Europe. Ney, the bravest of the brave, in command of the rear-guard, protected the retreat, but only 20,000 out of the 400,000 who had crossed the Niemen in June recrossed it in December. The disaster, however, was greater than the mere loss of an army of 400,000 men. Napoleon had lost his prestige, and henceforth Castlereagh, the English Foreign Minister, and the Czar Alexander supplanted Napoleon as controllers of the destinies of Europe. The Czar advanced into Eastern Prussia, where he installed as Governor the ex-Minister Stein, who placed himself at the head of a great Prussian patriotic rising against Napoleon. Driven by this outburst of national spirit, Frederick William III. signed an alliance with the Czar at Kalisz (February 27, 1813). Austria, under Metternich, hesitated between Napoleon and Alexander and offered to mediate. Napoleon sent into Germany a new army made up of conscripts and of troops withdrawn from Spain, and on April 29th, at Weimar, assumed the direction of the campaign of 1813, which he had decided to fight on the line of the Elbe, where Eugène de Beauharnais and Davout were struggling to check the Russians and repress the Prussians. Successes at Lützen and Gross-Görschen (May 2d) on the great plain around Leipzig enabled Napoleon to occupy Dresden as his base

of operations, and advance to Bautzen, where he defeated the Allies on May 20th-21st.

Napoleon should have followed up this movement with vigor, but he hesitated because of the untrained condition of his army and of the attitude of Austria. Bernadotte, after the Treaty of Stockholm with England (March 3d), had landed at Stralsund, prepared to take an active part in the overthrow of Napoleon, whom he had learned to hate bitterly. Moreau, the only surviving French rival of Napoleon, was summoned from America to act as chief adviser of the Allies. England signed new treaties with Prussia and Russia (June 14th-15th), and the Czar and Metternich signed at Reichenbach (June 27th) a secret treaty, by which Austria bound herself to join the Allies if Napoleon did not accept her proposals before the expiration of the truce, on August 10th. This was equivalent to a treaty of alliance, for it was certain that the Congress of Prague would accomplish nothing. On August 10th the Austrian army under Schwarzenberg began operations in Bohemia in concert with the allied army under Blücher in Silesia. The victory of Wellington at Vittoria (June 21, 1813) encouraged the Allies and made a great victory an absolute necessity to Napoleon, who promptly took the offensive and attempted to force a battle with Blücher near Görlitz and crush him and then turn against Schwarzenberg. Blücher evaded battle and Schwarzenberg advanced to attack Dresden. Napoleon reached Dresden just in time, and on August 26th-27th won his last great victory. (See DRESDEN, BATTLE OF.) For the moment Dresden was saved, but the success was more than offset by the defeats inflicted upon his subordinates, Oudinot at Grosbeeren (August 23d), Macdonald on the Katzbach (August 26th), Vandamme at Kulm (August 29th-30th), and Ney at Dennewitz (September 6th). The losses of Napoleon during the ten-days' campaign were almost overwhelming and irretrievable, while reinforcements speedily made good the losses of the Allies. Napoleon failed to appreciate that the line of the Elbe had become untenable from the moment that Austria joined the Allies, and instead of falling back of the Rhine and offering to negotiate, he continued to struggle to hold Dresden. Constant rains and bad roads had been an important factor in the August campaigns and prevented Napoleon, in spite of his boundless energy and activity, from accomplishing anything in September. This failure was fatal, for in October the Allies, who had defined their relations in the Treaty of Toplitz (September 19th), took the offensive and developed their campaign with such skill that Napoleon was completely deceived until they had nearly completed their dispositions. Blücher, unperceived, crept around Napoleon's left, got in touch with Bernadotte, and advanced toward Leipzig from the north, while Schwarzenberg was advancing from the south toward the same place. Napoleon left Gouvion Saint-Cyr to hold Dresden and hurriedly concentrated all available forces to protect Leipzig and hold his lines of communication. For three days (October 16th, 18th, and 19th), 'the Battle of the Nations' raged around Leipzig, and on the last day the French were driven out of Leipzig in a disastrous rout. (See LEIPZIG, BATTLES OF.) Napoleon retreated hastily behind the Rhine, stopping only to destroy, at Hanau (October 30th), the army

of Bavaria, which had recently joined the Allies. Napoleon made a serious mistake in leaving able lieutenants with large garrisons to hold the great German fortresses, thus depriving himself of the assistance of Rapp, who held Danzig with 8000 men; Davout, who was shut up in Hamburg with 12,000 men, and many others. These places were besieged and captured by the Allies during the ensuing months, but the bulk of the allied army pressed on toward Paris. Blücher with the Prussians and part of the Russians crossed the Rhine at Caub (December 31st) and began the invasion of France; Schwarzenberg, with the Austrians and the rest of the Russians, entered France by the way of Basel. To meet this double invasion, Napoleon could only muster a small army. This he interposed between Blücher and Schwarzenberg, whom he defeated in turn. Blücher's army was dispersed in the battles of Brienne, Champaubert, Montmirail, and Vauchamps, between January 29th and February 14, 1814, while divisions of Schwarzenberg's army were severely worsted at Nangis (February 17th) and Montereau (February 18th).

This first defensive campaign of 1814 is one of the most brilliant defensive fights in military history. The military genius of Napoleon never shone more brightly, though the dulling of his political sense made his failure inevitable. With a little army of worn out and defeated men, reinforced by a few hastily collected and untrained conscripts, he thrust himself between two vastly superior forces against which he hurled himself alternately with such swiftness, skill, and violence as to shatter the hostile armies and frustrate the plans of the opposing generals. Finally, worn out, he had to succumb to the overwhelming numbers of the foe and to the inseparable obstacles of time and space.

Napoleon, who had refused to accept the proposals of Frankfort submitted by the Allies on November 9, 1813, now sent Caulaincourt to meet their representatives in the Congress of Châtillon (February 3-March 19, 1814), but with instructions to 'sign nothing.' The Allies once more defined their relations to one another in the Treaty of Chaumont (March 1st), brought up new troops, and prepared to crush Napoleon. Napoleon's second defensive campaign of 1814 was a brilliant failure—a stubborn struggle against the inevitable. The first blows were struck at Blücher on March 7th and 9th at Craonne and Laon, but failed to interrupt Blücher's campaign seriously. An attack upon a part of Schwarzenberg's army at Arcis-sur-Aube met with no better success, and so Napoleon turned to the eastward to threaten Schwarzenberg's line of communication. But the great disparity of forces enabled the Allies to neglect this movement and to concentrate on Paris. Schwarzenberg and Blücher arrived before Paris on March 30th, and after hard fighting with Marmont, Mortier, and Moncey, occupied the French capital. The Emperor arrived just a few hours too late to strike a blow in defense of his capital, and could only make an obstinate attempt to renew the struggle south of Paris, but Ney and the other marshals finally forced him to listen to reason (April 4th) and to bring the campaign to a close. In the southwest, Soult had been driven from position to position and was about to lose his last battle at Toulouse. Suchet had withdrawn from Spain too late to help Soult;

Augereau at Lyons had failed to disturb Schwarzenberg's left flank. In Italy Murat had deserted to the enemy, negotiated with Austria, and turned the Neapolitan army against Eugène Beauharnais, the Viceroy of Italy, who faithfully and ably faced the triple danger of Murat's treachery, the invasion of the Austrians, and the occupation of Genoa by an English force under Lord William Bentinck. On April 11th Napoleon, the Emperor of the French, formally abdicated at Fontainebleau in favor of his infant son, the King of Rome.

In the stipulations with the Allies, Napoleon was allowed to retain the title and state of Emperor, but was to be detained as a prisoner on the island of Elba. The relations between the newly restored Bourbons and the Allies were settled by the First Treaty of Paris on May 30th. The changes which had taken place in Europe since the outbreak of war in 1792 had been such that the old order could not be restored, and accordingly a Congress of the Powers was summoned to meet at Vienna to make the necessary new arrangements. These were completed on June 9, 1815. But in the meantime Napoleon had left Elba, landed in France on March 1st, made his way to Paris, reestablished his power, gathered a new army and advanced to attack the Allies, whose representatives at Vienna planned at once to place new armies in the field and overthrow him a second time. (See HUNDRED DAYS.) The campaign, which lasted only a week, included Napoleon's defeat of Blücher at Ligny (q.v.) on June 16th, Ney's fight with Wellington at Quatre-Bras on the same day, and the final overthrow of Napoleon on the field of Waterloo (q.v.) by Wellington and Blücher on June 18, 1815. After this last battle Napoleon fled to Paris, where he abdicated a second time on June 22d. For a few days he hesitated between dreams of again playing a part in France and plans for an escape to America. The first was preposterous, the second impossible, and on July 15th he surrendered himself to Captain Maitland on board the English ship *Bellerophon*. The Allies under Blücher had entered Paris a second time on July 7th and made the final adjustments for the settlement of Europe in the Second Treaty of Paris on November 20th. Napoleon was taken to England, and after some deliberation his request to be permitted to settle in England was refused. He was transferred to the ship *Northumberland* and on October 16th landed on the island of Saint Helena. In his captivity he was accompanied by his faithful friend Bertrand, and by Gourgaud, Montholon, Las Cases, and a number of other individuals of minor importance. In 1816 Sir Hudson Lowe, a British soldier, arrived as Governor of the island. Napoleon's chief occupations as a captive were his quarrels with Lowe, and his monologues with Gourgaud and Montholon, which they wrote out and submitted for correction to the Emperor. These documents form a partial autobiography, valuable not for its facts, but for the light which it sheds upon Napoleon's character. Napoleon gave himself up to long periods of gloom and humored himself in the most inexcusable obstinacies when a more rational behavior would have improved his health and rendered his surroundings more agreeable socially. Cancer of the stomach, which had carried off his father, and which was to cause the

death of two of his sisters, was slowly undermining his health, and on May 5, 1821, he breathed his last at the set of sun. He was buried with military honors upon the island, but in accord with his own request, his remains were in 1840 taken from the island, attended by the faithful Bertrand, and under the direction of Louis Philippe placed in a magnificent sarcophagus beneath the Dome of the Hôtel des Invalides in Paris.

John Holland Rose has perhaps given the most correct summary of the qualities which made Napoleon great: "He was superlatively great in all that pertains to government, the quickening of human energies, and the art of war. His greatness lies, not only in the abiding importance of his best undertakings, but still more in the Titanic force that he threw into the inception and accomplishment of all of them—a force which invests the storm-blasted monoliths strewn along the latter portion of his career with a majesty unapproachable by a tamer race of toilers. After all, the verdict of mankind awards the highest distinction, not to prudent mediocrity that shuns the chance of failure and leaves no lasting mark behind, but to the eager soul that grandly dares, mightily achieves, and holds the hearts of millions even amidst his ruin and theirs. Such a wonder-worker was Napoleon. The man who bridled the Revolution and remolded the life of France, who laid broad and deep the foundations of a new life in Italy, Switzerland, and Germany, who rolled the West in on the East in the greatest movement known since the Crusades, and finally drew the yearning thoughts of myriads to that solitary rock in the South Atlantic, must ever stand in the very forefront of the immortals of human story."

BIBLIOGRAPHY. An excellent *Life* in English is Rose, *Life of Napoleon I.* (New York, 1901). Of the numerous other works on the life and times of Napoleon, the more important are: Bignon, *Histoire de France sous Napoléon* (14 vols., Paris, 1829-50); Thibaudeau, *Le Consulat et l'Empire* (10 vols., ib., 1834-35); Thiers, *Histoire de la Révolution française* (10 vols., ib., 1823-27); *Histoire du Consulat et de l'Empire* (21 vols., ib., 1845-61); Lanfrey, *Histoire de Napoléon* (5 vols., ib., 1869-75), which ends at 1811; Fournier, *†Napoleon I., eine Biographie* (Leipzig, 1886-89). For the early life of Bonaparte: Jung, *Bonaparte et son temps* (Paris, 1880-81), and Chuquet, *La jeunesse de Napoléon* (ib., 1897-99), are the most important. For the personal life of Napoleon, Lévy, *Napoléon intime* (Paris, 1892); Masson, **Napoléon et les femmes* (ib., 1893); *Napoléon et sa famille* (6 vols., ib., 1897-1903); *Napoléon chez lui* (ib., 1893); and *Napoléon inconnu* (ib., 1895), are the most valuable. On the military genius of Napoleon the most accessible are: Ropes, *The First Napoleon* (Boston, 1885) and *Campaign of Waterloo* (New York, 1893); Sargent, *Napoleon Bonaparte's First Campaign* (Chicago, 1894) and *Campaign of Marengo* (ib., 1897); Houssaye, *1814* (Paris, 1888) and *1815* (ib., 1894-99); and York von Wartenburg, *†Napoleon als Feldherr* (Berlin, 1885-86). For naval affairs: Mahan, *Influence of Sea Power Upon the French Revolution and Empire* (London, 1893). For ecclesiastical affairs: Haussonville, *L'Eglise romaine et le premier Empire, 1800-14* (Paris, 1868-70), may be cited. For the relations with the Germanic States the most

notable works are Oncken, *Das Zeitalter der Revolution, des Kaiserreichs und der Befreiungskriege* (Berlin, 1884-86); Bailleu, *Preussen und Frankreich, 1795-1807* (Leipzig, 1887); Beer, *†Zehn Jahre österreichischer Politik, 1801-10* (ib., 1887); Wertheimer, *Geschichte Oesterreichs und Ungarns im ersten Jahrzehnt des neunzehnten Jahrhunderts* (ib., 1884-90). For relations with Russia, Bogdanovitch, *Histoire du règne d'Alexandre Ier* (Paris, 1869-71); Tatischeff, *Napoléon et le Tsar Alexandre* (ib., 1891). For relations with Spain, Gomez de Arteche, *Guerra della Independencia* (1868 et seq.). For relations with Italy, Tivaroni, *Storia critica del risorgimento italiano*, vols. i.-iii. (Turin, 1889-91). For relations with England and the United States, Adams, *History of the United States, 1801-17* (9 vols., New York, 1889-91). For original documents consult the files of the *Moniteur*; the volumes of the *Archives parlementaires*; *Napoléon I., Correspondance* (32 vols., Paris, 1858-70); and the new volumes of Napoleon's correspondence published recently by Lecestre and by Brotonne. Of great value are many of the writings by and on the contemporaries of Napoleon, such as his marshals, notably Davout, Marmont, and Soult; his ministers, notably Talleyrand, Savary, and Chaptal; his generals and subordinates, especially Dumas, Foy, *Jomini, *Marbot, Ségur, *Thiébauld, and Vandamme; his brothers Joseph, Lucien, Louis, and Jerome, and his stepson Eugène de Beauharnais; personal attendants like Bourrienne, *Meneval, Las Cases, and Montholon; minor officials and others, notably *Miot de Melito, *Pasquier, Roederer, Ouvrard, Lavalette, Vitrolles, and Mme. de Rémusat. Of great value are also similar works by or on the Prussians, Hardenberg, Stein, Scharnhorst, Gneisenau, and Clausewitz; the Austrians, Metternich, Gentz, and the Archduke Charles; the English, Castlereagh, Canning, Nelson, Wellington, and Napier; and the Russian, Barclay de Tolly.

NAPOLEON II. Son of Napoleon I. See REICHSTADT, DUKE OF.

NAPOLEON III., CHARLES LOUIS NAPOLEON BONAPARTE (1808-73). Emperor of the French. He was the third son of Louis Bonaparte, King of Holland, and of Hortense Beauharnais. (See BONAPARTE.) The law of succession enacted under the First Empire gave the crown, in default of direct descendants of the Emperor, to the sons of either Joseph or Louis Bonaparte. Joseph being childless, the sons of Louis became heirs apparent of the Napoleonic pretensions. Louis Napoleon was born April 20, 1808, in Paris. He spent his boyhood with his mother at her Château of Arenenberg in Switzerland, and at Augsburg, where he studied in the gymnasium. After the death of the elder of his brothers he returned to France with his mother, but they were expelled by Louis Philippe, went to England, and thence returned to Switzerland. The death of the Duke of Reichstadt (July 22, 1832), only son of the first Napoleon, left Louis Napoleon the representative of his family, and thereafter the restoration of the Napoleonic Empire became his fixed idea. During the next four years his published works kept him before the French people. Among them were: *Révères politiques*; *Projet de constitution*; *Deux mots*

*These are also in English translations.
†These are also in French translations.

à M. de Chateaubriand sur la duchesse de Berri (in verse); and *Considérations politiques et militaires sur la Suisse*. In 1836, believing in the weakness of the July monarchy, he undertook at Strassburg a coup which was so absurd a failure that it covered him with ridicule. He was sent to America, but returned to Europe on account of his mother's illness. She died October 3, 1837, and soon afterwards the French Government asked for his expulsion by Switzerland. He went to London, where, in 1838, he published the *Idées Napoléoniennes*, which had considerable circulation in France. In 1840 he made at Boulogne his second attempt to bring about a military uprising in his favor, but this was as complete a failure as its predecessor. He was imprisoned in the fortress of Ham, where he wrote several works, some political articles, and had a share in editing the *Dictionnaire de la conversation*. He escaped from Ham, May 25, 1846, and made his way to the Belgian frontier and thence to England. He hastened back to France when the Revolution of 1848 broke out, but, although he professed devotion to the Provisional Government, he was distrusted and asked to leave the country. Notwithstanding his promise to do this, he obtained an election to the National Assembly for Paris and three other departments. He took his seat on June 13, 1848, but resigned on the 15th, after a stormy debate, and left France. He was, however, elected from five departments in September, and returning became a candidate for the Presidency. He received 5,500,000 votes in the election of December 10, 1848, his closest opponent, General Cavaignac (q.v.), having 1,500,000. He entered upon his office on December 20th. His Presidency was a continuous contest with the majority in the Assembly, who continued to doubt the sincerity of the President's devotion to the Republic. This disturbed condition was ended by the coup d'état of December 2, 1851, a thoroughly Napoleonic stroke, carried out with blunt disregard for law or political honesty, by the President himself, assisted by Morny, Maupas, and Saint-Arnaud. The cost of success was the establishment of a repressive tyranny maintained by military force. France submitted to the new ruler, who promised to restore the glories of the past. On December 20th-21st the President was reelected for ten years by more than seven million votes, practically without opposition. He had revived the plebiscite, used with such effect by his uncle—a plebiscite so managed that the issue was a foregone conclusion. In the same way, when he had himself proclaimed Emperor, as Napoleon III., just a year after the coup d'état (December 2, 1852), it was made to appear that this also was in accordance with the popular will. The new Emperor had studied his uncle's methods and attempted to imitate him as far as circumstances and his own ability would permit, but he only won for himself the name of Napoleon the Little. He possessed ability, but it was that of the politician rather than of the statesman. He lacked the dash and rapidity of decision which were the chief elements in accomplishing the vast schemes of the first Napoleon. Napoleon III. hesitated in deciding upon a policy and in carrying it out when once determined. Conspiracies against him developed as early as 1853 and three attempts were made to assassinate him, by Pianori and Bellamare in 1855, and by Orsini (q.v.) in 1858.

Napoleon III. was looked upon coldly by the 'legitimate' sovereigns of Europe, but the aim of his foreign policy was to make France again dominant in European affairs and himself the general arbiter of the Continent. To check the similar pretensions of Nicholas I. of Russia in Eastern Europe, he joined England in protecting Turkey against Russian aggression, and France took the leading part in the Crimean War (q.v.). The pacification which followed and the adjustment of the Eastern Question (q.v.) were arranged by a congress at Paris. (See PARIS, TREATIES OF.) The three Eastern Powers, Russia, Prussia, and Austria, which were the strongholds of legitimacy and autocracy, as against the democracy of France and England, were Napoleon's natural opponents. In the Crimean War he administered a lesson to one of them. By befriending Italy, which under the leadership of Sardinia was struggling to free itself from Austrian oppression, he found an opportunity to strike at Austria and to uphold in the most marked manner his favorite political hobby, the principle of nationalities. He encouraged Cavour (q.v.) in the advocacy of Italy's cause at the Congress of Paris, and, though the attempt of Orsini upon the Emperor's life almost destroyed the cordial relations that had been cultivated between the Courts of Paris and Turin, under Cavour's shrewd management the Emperor finally became more friendly than ever. The two held a private conference at Plombières, July 20, 1858, at which Napoleon agreed to support Sardinia in case of an attack by Austria. Cavour at once forced Austria into aggressive action, and Napoleon, now half repentant of his engagement, took the field. The Italian campaign of 1859, in which Napoleon showed himself utterly incapable of military leadership, was marked by two great battles, Magenta and Solferino, won by the Allies. Napoleon then selfishly closed the struggle by the preliminaries of Villafranca. (See CAVOUR and ITALY.) He exacted from Victor Emmanuel the cession of Nice and Savoy, although he had failed to deliver Venetia and the duchies. His later relations with Italy were disturbed by the fact that he felt called upon to uphold the Pope in his temporal possessions, and thus clashed with the national ambition of the Italians for complete unity with Rome as the capital. The protection of French troops was only withdrawn from the Papal States when war with Prussia had begun. During the Civil War in the United States (1861-65) Napoleon took an active part with the English Government in the diplomatic intrigues against the United States. He took advantage of the disturbed condition of Mexican affairs and of the preoccupation of the United States to revive his uncle's dream of a Latin-American empire under French protection, by establishing the Archduke Maximilian on the new imperial throne of Mexico by means of French bayonets. Secretary Seward warned the French Emperor that the Government of the United States could only consider this as an infringement of the Monroe Doctrine and an unfriendly act, but no attention was paid to this protest until the termination of the Civil War made it possible to send General Sheridan with an army of seasoned troops to the Mexican frontier, when the French troops were removed and the unstable Mexican Empire collapsed (1867). This struck a great blow at the prestige of the Emperor. In 1863-64, when

the Schleswig-Holstein (q.v.) question engaged the attention of the Powers, Napoleon refused to aid Denmark in her fight for the duchies and advocated the recognition of the principle of nationalities through the union of the German portion of the duchies to Germany. On the eve of the war of 1866 Napoleon entered into negotiations with both Prussia and Austria, with respect to an alliance, but he was foiled by Bismarck's diplomacy, and the swift issue of the Seven Weeks' War (q.v.) revealed to Napoleon a new military power under masterful guidance, threatening his schemes for European control. Austria ceded Venetia to Napoleon with the understanding that it was to be made over to Italy. This was his last appearance in the rôle of an arbiter in the affairs of Europe.

The internal history of the Empire divides itself into two periods, that of the autocratic and that of the liberal Empire. Napoleon, the man of progressive and liberal ideas, believed that a permanent political edifice could be erected only by the exercise of absolute power. At the outset he brought under his own control the finances and public enterprises; public liberty was restricted, and a thorough system of police espionage was organized. Napoleon married, January 30, 1853, Eugénie de Montijo, a young Spanish countess, and gratified his own ambitions and her tastes with a brilliant, extravagant, and frivolous court. The Empress Eugénie's influence was always exerted in the interest of the Ultramontane Party. In these days of his absolute power Napoleon pushed public improvements with great energy. Philanthropic institutions were multiplied in France; industrial development was encouraged; and an era of great material prosperity followed, degenerating into one of speculation and luxurious living in which were the seeds of decadence. Railroads and highways were constructed and lines of steamships were established and subsidized. Canals were built and harbors improved. Manufactures, agriculture, and forestry were all fostered by the State. Stock companies were created, and the *crédit foncier* and the *crédit mobilier* stimulated these enterprises with financial support. Paris, under the Prefect Haussmann, was transformed. As early as the exposition of 1855 Paris was able to show a new city to its visitors, and at the brilliant exposition of 1867 this development was still more marked. Politically, there were three parties in opposition—Legitimists, Orleanists, and Republicans. Of these the Legitimists were almost lost sight of, with the exception of a few irreconcilable leaders. The Orleanists were stronger in numbers and in the quality of their adherents, and gave the Emperor more anxiety. The great literary leaders were found in their camp, and the French Academy was their stronghold. The really active opposition, however, lay with the Republicans. None of these parties had any legal means of expression or action. In 1858, after the Orsini attempt, the General Security Act was forced through the Corps Législatif, giving the Government power to exile or transport without trial any person convicted of a political offense. Wholesale arrests were made under this act for the purpose of intimidating the Republicans. Having alienated the Ultramontanes, upon whose support he had hitherto depended, by the Italian War, Napoleon relaxed some of his repressive measures to gain the sup-

port of the Liberals. In 1859 an amnesty decree allowed the return of the exiles of 1851. This was followed by a grant of more freedom of action to the Corps Législatif. The commercial treaty of 1860 with England abolished the prohibitions and lowered many of the high protective duties which had formed a part of the Emperor's commercial system. The restrictions upon the freedom of the press were partially removed. A Liberal opposition now began to organize through a coalition of the opposition parties, and after 1863 there was real parliamentary activity in France. A section known as Liberal Imperialists supported the Emperor, but opposed his reactionary ministers. The Ministry, headed by Rouher, and with Drouyn de Lhuys in charge of foreign affairs, favored a vigorous attitude of opposition to Prussia. The Emperor was broken in health, and after the Prussian triumph over Austria had demoralized his plans and left him discredited with his own ministers, he turned for support to the constitutionalists in the Corps Législatif. The liberties of that body and of the press were much extended, and the right to hold public political meetings was conceded. In 1869 a responsible Ministry was granted.

In 1870 the following proposition was submitted to a plebiscite: "The French nation approves the liberal reforms made in the Constitution since 1860, and ratifies the Senatorial decree of April 20, 1870." This was opposed by the Republicans, but was carried by a vote of 7,000,000 to 1,500,000. This popular support of the Imperial régime was apparent rather than real. Notwithstanding temporary coalitions, the different parties were still irreconcilable. The autocratic and war party, which had voted in the affirmative on the plebiscite, came again into power in the Corps Législatif, with the Duke of Grammont in charge of foreign affairs. Partly compelled by the diplomacy of Bismarck, and partly actuated by their own aims, the Ministry brought on the war with Prussia, much against the will of the Emperor. (See FRANCO-GERMAN WAR.) The Emperor went to the front, leaving the Empress as Regent, and she constituted a Ministry of the war party under General Pasko. Napoleon was captured at Sedan (September 2, 1870), and on the 4th of September was taken to the Castle of Wilhelmshöhe, near Cassel. In the wild confusion that attended the news of defeat in Paris and the declaration of the Republic, the Empress fled from the city and went to England, taking up her residence at Chislehurst, Kent, where she was joined by Napoleon in 1871, after the conclusion of peace. He resided there until his death, January 9, 1873.

Napoleon and Eugénie had one child, a son, Eugène Louis Jean Joseph, Prince Imperial of France, born March 16, 1856. See NAPOLEON, EUGÈNE LOUIS JEAN JOSEPH.

A collection of Napoleon's own works was published in five volumes (Paris, 1869). Many of them, including the *History of Julius Cæsar* and *Napoleonic Ideas*, have been translated into English. The *Posthumous Works and Unpublished Autographs of Napoleon III. in Exile* were edited by De la Chapelle and published in 1873. English works on Napoleon III. are those of Forbes (London, 1898); Jerrold (London, 1874); and Frazer (London, 1895). In translation are the works of Imbert de Saint Amand, *Louis Napoleon and Mlle. de Montijo* (Eng. trans. New York,

1897), *Napoleon III. and His Court* (ib., 1898), and *The Court of the Second Empire* (ib., 1898). The leading comprehensive histories of the Second Empire are: De la Gorce, *Histoire du second empire* (4 vols., Paris, 1885-98), which partially supersedes the earlier work by Taxile Delord, *Histoire du second empire* (6 vols., Paris, 1869-76). Consult, also, Thirria, *Napoléon III. avant l'empire* (Paris, 1895); Villefranche, *Napoléon III.* (ib., 1897); Gottschalk, *Napoleon III., eine biographische Studie* (1871); Von Sybel, *Napoleon III.* (1873); Simson, *Die Beziehungen Napoleons III. zu Preussen und Deutschland* (1882); Murdock, *Reconstruction of Europe* (Boston, 1891); Victor Hugo, *Histoire d'un crime* (1877); and id., *Napoléon le petit* (1852).

NAPOLEON, EUGÈNE LOUIS JEAN JOSEPH (1856-79).. The only son of Napoleon III. of France; better known as the Prince Imperial. He was born in the Tuileries in Paris, March 16, 1856. At the outbreak of the Franco-German War of 1870-71 he accompanied his father to the front and was first under fire at Saarbrücken. When the war began to go against the Imperial arms, however, he was sent to England, where he joined his mother after her flight from Paris. Upon the death of his father he took the title of Count of Pierrefonds. In 1874 he reached his majority and was proclaimed as Napoleon IV. by his adherents. Five years later, in order to arouse enthusiasm on his behalf among his countrymen, he joined a British expedition against the Zulus, and while reconnoitring was ambushed and killed (June 1, 1879). Consult: Barlee, *Life of Napoleon, Prince Imperial of France* (London, 1880); Hérisson, *Le prince impérial* (Paris, 1890); and Martinet, *Le prince impérial* (ib., 1895).

NAPOLEON, JOSEPH CHARLES PAUL, Prince (1822-91). A son of Jerome Bonaparte. See BONAPARTE.

NAPOLEON GUN. See ARTILLERY.

NAPOLEON LE PETIT, le pe-tê' (Fr., Napoleon the Little). A violent satirical attack on Louis Napoleon by Victor Hugo, written at Brussels in 1852.

NAPOLEON'S TOMB. The magnificent burial place of Napoleon Bonaparte is under the dome of the Invalides, Paris. It was constructed by Visconti and has the form of a circular crypt 20 feet deep and 36 in diameter, open at the top. On the granite walls are ten marble reliefs by Simart. The mosaic pavement, representing a laurel wreath, bears the names of various battles. In the middle rises the red granite sarcophagus, 13 feet long, 6½ wide, and 14½ high, cut from a single block weighing 67 tons, surrounded by 12 victories by Pradier. Above the entrance to the crypt is a sentence from Napoleon's will: "I desire that my ashes shall rest on the banks of the Seine, in the midst of the French people that I have loved so well." On one side is the sarcophagus of the Emperor's friend Duroc, who fell at Bautzen in 1813, on the other that of his faithful companion Bertrand, who shared his captivity. Napoleon's remains were brought from Saint Helena to their present burial place by the Prince de Joinville in 1840.

NAPOLEON-VENDEE, vān'dā'. A former name of Roche-sur-Yon (q.v.). A town of France.

NARA, nā'rā. The capital of a prefecture of the same name on the island of Hondo, Japan, situated 25 miles by rail southeast of Osaka (Map: Japan, D 6). It was the capital of Japan from 709 to 784. The most interesting temples are the Kasuga, situated in a magnificent park; the Todai-ji with its huge bell, over 13 feet high and more than 9 feet in diameter, and the gigantic statue of Buddha over 53 feet high; and the Koboku-ji with the modern statues of Brahma and Indra. Of great archaeological value is the storehouse in which specimens of articles used in the Imperial household for over a thousand years have been preserved. The local museum is also of considerable archaeological interest. The principal manufactures of Nara are Indian ink, fans, and modern toys. Population, in 1898, 30,539.

NARAKA, nā'rā-kā (Skt., hell). The hell of the Hindus. The doctrine of a place for the bad, though not necessarily a place of torment, is as old as the Veda. This region was one of bottomless darkness beneath the earth. The faith of the Brahmanic period and of the Upanishads had the same belief, and the descriptions of hell-torments became fully developed later. Manu enumerates 21 hells, and gives a general description of the tortures which await the impious there. The Puranas, however, are more systematic. The Vishnu-Purana, for instance, not only names 28 such hells, but distinctly assigns each of them to a particular class of sinners. Besides these hells which the Purana knew by name, there were countless others. Buddhism shares with Brahmanism in the later doctrine of hell-torment and the grades of hell. Consult: Scherman, *Materialien zur Geschichte der indischen Visionsliteratur* (Leipzig, 1892); Hopkins, *Religions of India* (Boston, 1895).

NARBADA, nūr-būd'ā. A river of India. See NERBUDDA.

NARBONNE, nār'būn' (Lat. Narbo). A town in the Department of Aude, in Southern France, situated six miles from the Mediterranean, and 93 miles by rail southeast of Toulouse (Map: France, J 8). The streets of this formerly important city present a poor appearance, relieved only by those of the attractive new but small quarter. The Church of Saint Just was in olden times the cathedral. It is an imposing though uncompleted structure, begun in the Middle Ages, and exhibiting many of the most daring ideas of the Gothic. Its choir is 131 feet high; the towers rise 194 feet. The Gothic Hôtel-de-ville is a creation of Viollet-le-Duc. There is a good museum, containing chiefly paintings and ceramics. Narbonne has a hydrographical school and a seminary. Its industries include coopering and distilling establishments. It produces verdigris, candles, tiles, pottery, dyes, and leather. It deals in wine, grain, oil, salt, and sulphur. Its honey is famous, and its red wine is peculiar to the district. It has a Chamber of Agriculture and an œnological station, the latter established in 1894. The town is on a branch of the important Canal du Midi. About 11 miles to the south is the port La Nouvelle, at the end of the Narbonne Canal. It is the harbor for Narbonne, and has some manufactories. Population of Narbonne, in 1901, 28,852, a decrease of 700 since 1891. Narbo became Roman in B.C. 116. It was

at the time one of the leading ports of the Mediterranean, and well known for its beauty and attractions as a city. It was the capital of the Provincia Romana, and later of Gallia Narbonensis. In the fifth century it passed under the sway of the Visigoths. About 720 it fell into the hands of the Saracens, from whom it passed into the possession of the Franks in 759. The Viscounts of Narbonne became hereditary feudatories of the French Crown in 1080. In 1447 Viscount William III. sold Narbonne to the House of Foix, and 60 years later the fief was united with the French Crown. Late in the Middle Ages the harbor of Narbonne became practically filled up and the town began to decline.

NARBROUGH, Sir JOHN (1640-88). An English admiral and explorer. In 1670 he made a notable voyage through the Strait of Magellan and up the Chilean coast. He was knighted and made rear-admiral in 1673, and the following year he sailed to the Mediterranean, where he distinguished himself by scattering the pirates of Tripoli and Algiers. In 1687 he sailed to the West Indies in command of a squadron, and he died there of fever while superintending the investigation of a sunken treasure ship, and was buried at sea off Santo Domingo.

NARCIS/SUS (Lat., from Gk. *Nάρκισσος*, *Narkissos*, from *νάρκη*, *narkē*, torpor). According to Ovid, the son of the river-god Cephissus and of the nymph Liriope of Thespiæ, in Bœotia. He was a youth of extraordinary beauty, but refused all suitors. They prayed to Nemesis for vengeance, and she caused Narcissus to see his own image in a forest spring. Enamored of this, he pined away in hopeless love beside the stream. From his body sprang the flower Narcissus. The story, which seems to be of Alexandrian origin, is told with variations by other late Greek and Roman writers. The bronze statuette in Naples, commonly called Narcissus, really represents the youthful Dionysus.

NARCISSUS. A genus of beautiful bulbous plants of the natural order Amaryllidaceæ, with narrow leaves and usually white or yellow flowers. The species are natives of Southern Europe, Northern Africa, and the temperate parts of Asia. Many are cultivated in gardens for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of daffodil and jonquil. The different species are naturally separated into two divisions, those bearing but one flower on a scape and those bearing more than one. The poet's narcissus (*Narcissus poeticus*) is perhaps the best known and most popular species. It is a hardy plant and bears white fragrant flowers. The jonquil (*Narcissus Jonquilla*) bears from two to five very fragrant golden yellow blossoms on a scape. This species is employed in the manufacture of perfumes. *Narcissus Tazetta* is the narcissus of the ancient Greeks and Romans, and is now largely grown as a forcing-house plant. There are numerous varieties of this species with white, yellow, single, and double flowers. *Narcissus Pseudo-Narcissus* is commonly called daffodil or trumpet daffodil. The plants are ordinarily propagated by offset bulbs which

are produced on the bulb. These usually flower the second year after planting. See Colored Plate of AMARYLLIDACEÆ.

POET'S NARCISUS (*Narcissus poeticus*).

NARCOTICS (Gk. *ναρκωτικός*, *narkotikos*, benumbing, from *ναρκών*, *narkoun*, to benumb, from *νάρκη*, *narkē*, torpor; connected with OHG. *snerhan*, to draw together, AS. *snear*, Eng. *snare*). Remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium is the type from which most descriptions of this class of medicines have been drawn; but although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stimulating, especially when given in small or moderate doses; but this stage of their action is comparatively short, and when the dose is large the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of hypnotics and soporifics; while many of them are termed anodynes, from their possessing the property of alleviating pain. Next to opium and the general anæsthetics, hyoscyamus, Indian hemp, and chloral may be regarded as the most important narcotics. Of late years a number of coal-tar derivatives have been introduced, such as sulphonal, trional, acetanilid, and phenacetine, which are taking the place, to some extent, of the older remedies.

It has been already mentioned that there are differences in the mode of operation of the different members of this class. Alcohol, for example, in sufficient doses produces intoxication; belladonna, delirium; opium contracts the pupil of the eye; hyoscyamus dilates it. Each drug affects the organism in its own peculiar way, and it is impossible to give a general description of their minor actions.

Narcotics are usually administered with the view either of inducing sleep or of alleviating pain or spasm. As, however, their action is much

modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution, and, as a general rule, only under competent advice. The various quack medicines for children which are known as *carminatives*, *soothing syrups*, etc., contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes.

NAR/COTINE, $C_{12}H_{17}NO_7$. One of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 to 8 per cent. It is nearly insoluble in water, and but sparingly soluble in alcohol and ether, but dissolves readily in chloroform. Narcotine possesses very slight alkaline properties; its salts do not readily crystallize, and are even more bitter than those of morphine, although the substance itself is almost tasteless. See **ALKALOIDS**.

NARD. A fragrant plant. See **SPIKENARD**.

NARDÒ, nâr-dô' (Lat. *Neretum*). A town in the Province of Lecce, Italy, 34 miles south by east of Brindisi (Map: Italy, N 7). It is the see of a bishop, has a cathedral and an old castle, and manufactures woolen goods and tobacco. The surrounding country abounds in olive plantations and vineyards. Population (commune), in 1881, 10,683; in 1901, 14,387.

NARDUS (Lat., nard, from Gk. *νάρδος*, from Pers. *nard*, from Skt. *nalada*, Indian spikenard). A genus of one species of grass (*Nardus stricta*), often called mat-grass, a purplish perennial growing in tufts characteristic of dry elevated situations in Europe, Australia, etc. It has little or no feeding value.

NARES, nârz, Sir GEORGE STRONG (1831—). A British Arctic explorer, born at Danestown, Scotland. He entered the navy in 1846, and went with Meham on the *Resolute* in the Arctic expedition of 1852. In 1872-74 he commanded the famous *Challenger* expedition, engaged in deep-sea exploration. In 1875, in command of the splendidly equipped *Alert* and *Discovery*, he set out on a Polar expedition, and proceeding up Smith Sound, he reached with the *Alert* the parallel of 82° 27', the farthest north any ship had then gone. Markham, his lieutenant, on sledges went in 1876 as far as 83° 20', another record at the time. In 1878 Nares surveyed Magellan Strait and many parts of the Pacific. He served in the Harbor Department of the Board of Trade (1879-96), and in 1892 became vice-admiral. He wrote: *Reports on Ocean Soundings and Temperature* (1874-75); *Official Report of the Arctic Expedition* (1876); and *Narrative of a Voyage to the Polar Sea* (1878).

NARES, ROBERT (1753-1829). An English philologist, born at York. After studying at Christ Church, Oxford, he took orders, and from 1798 until his death was Canon of Lichfield. As critic, essayist, and theologian he held a high rank among the writers of his time. With the Rev. William Beloe he founded the *British Critic* in 1793, and he published: *Elements of Orthœpy* (1784); *Chronological View of the Prophecies Relating to the Christian Church* (1805); and *A Glossary of Words, Phrases, Names, and Allusions in the Works of English Authors* (1822), which is by far his most important work, contains many excellent criticisms of the text of Shakespeare,

and is valuable for all of the Elizabethan literature.

NAREW, nâr'êv. A river of West Russia, rising in the Government of Grodno. It flows westward, forming part of the boundary of Poland, and joins the Bug 19 miles north of Warsaw. Its length is 271 miles, 212 of which are navigable. The Augustowo Canal connects it with the Niemen.

NARIÑO, nâr-rê'nyô, ANTONIO (1765-1823). A Colombian politician, born in Bogotá. In 1795, on account of his republican views, he was deported to Spain, whence he escaped to France and England. In 1797 he returned to New Granada. In the War of Independence, Nariño took a prominent part as leader of the Centralist Party and withstood the attacks of the Federalists on Bogotá. He had now become dictator and turned his attention to the Spanish forces in the south, by whom he was defeated and captured in 1814. After five years' imprisonment in Spain he returned to Colombia, was acquitted of a charge of embezzlement and malfeasance, and appointed Vice-President by Bolívar.

NARNI, nâr'nê. A town in the Province of Perugia, Italy, on the Nera, 45 miles north of Rome by rail (Map: Italy, G 5). Ruins of a massive marble bridge built by Augustus and of a very ancient aqueduct are still to be seen. Narni has been the seat of a bishopric since 360. The Cathedral of Saint Juvenalis dates from the thirteenth century. Other buildings of interest are the castle, now used as a prison, and the town hall with a finely sculptured façade. Narni, the ancient *Nequinum*, was colonized by the Romans about B.C. 300. The Emperor Nerva was born here. Population (commune), in 1881, 11,671; in 1901, 12,725.

NARO, nâr'ô. A town in the Province of Girgenti, Sicily, situated at an altitude of 1945 feet, 12 miles east of Girgenti (Map: Italy, H 10). It has a sixteenth-century castle of the Chiaramonti, and remains of catacombs, grottoes, aqueducts, and other antiquities. The brimstone pits in the vicinity yield large quantities of sulphur. Population (commune), in 1881, 10,395; in 1901, 12,866.

NAR/RAGAN'SET. A former leading Algonquian tribe of New England, occupying most of the territory along the western shore of the bay of the same name, in Rhode Island, and claiming dominion over several smaller tribes of the interior and the islands, including Long Island. They seem to have been of more ancient occupancy than the neighboring Mohegan and Pequot. They escaped the pestilence which had desolated the southern New England coast in 1617, and being joined by many of the fugitive survivors, soon became a strong tribe, so that it is certain that they numbered several thousands when first known to the whites. They befriended Roger Williams, and through his influence refused to join in the Pequot War. In King Philip's War the Narraganset took a leading part under their chief Canonius. In the celebrated 'Swamp Fight' they lost nearly 1000 in killed and prisoners. Canonius himself was killed soon afterwards. Those who surrendered at the close of the war were settled among their former tributaries, the Niantic (q.v.), the whole body thenceforth being known as Narraganset. They

were assigned a tract of land near Charlestown, on the southwestern coast of Rhode Island, where they have gradually decreased by emigration and decay, until they are now reduced to a mongrel remnant of mixed Indian, negro, and Portuguese blood.

NARRAGANSETT BAY. An inlet of the Atlantic Ocean, extending into Rhode Island (Map: Rhode Island, C 3). It is 28 miles long, from 3 to 12 miles broad, and receives the waters of several small rivers, the principal one being the Providence. It contains a number of islands of which Rhode Island, Prudence, and Conanicut are the largest. At the head of the bay lies the city of Providence, and Newport is situated at its entrance.

NARRAGANSETT PIER. A noted watering place in Washington County, R. I., nine miles from Kingston Station, where a branch line connects with the New York, New Haven and Hartford Railroad (Map: Rhode Island, C 4). It is delightfully situated near the mouth of Narragansett Bay, and has a fine beach and splendid drives. Among other attractions of the resort are its scenery, Narragansett Heights in particular commanding an extended view, and the beautifully colored rocks in the vicinity, which are picturesque also in form. There are a number of handsome summer residences and many hotels. Population (Narragansett District), in 1890, 1408; in 1900, 1523. The first settler came to this neighborhood about 1675, and in 1815 the pier from which the place takes its name was built. It was not until after 1876, when a railroad was completed to this point, that 'The Pier' became a favorite summer resort. Near by in December, 1675, General Winslow, at the head of 1000 colonists, defeated the Narragansett Indians, of whom 300 were killed and about 600 captured, while the whites lost 80 killed and 150 wounded.

NARBRENSCHIFF, nār'ren-shif, Das (Ger., The Ship of Fools). The most celebrated work of Sebastian Brant (q.v.).

NARSES, nār'sēs (?-568). A celebrated eunuch statesman and general of the Byzantine Empire. He was an Armenian by birth, and was probably sold as a slave in childhood. He rose by successive steps to the post of grand chamberlain to the Emperor Justinian. In 532 he aided in suppressing the 'Nika' rebellion. In 538 he was sent to Italy to act in concert with Belisarius (q.v.) in the war against the Goths. After gaining some successes, Narses came into conflict with Belisarius and was recalled to Constantinople in 539. After Belisarius had been recalled, Narses was appointed to the chief command in Italy. Near Tagina in 552, after a desperate engagement, the Goths were totally defeated, and their King, Totila, slain. In the following year Teja (q.v.) was defeated near Sorrento. Narses took possession of Rome, and completely extinguished the Gothic power in Italy. He was appointed exarch of Italy in 553. He fixed his court at Ravenna, and continued till the death of Justinian in 565 to administer the affairs of Italy with vigor and ability. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population, though their sever-

ity may be in some degree palliated by the splendor and utility of the public works on which he partly expended the public resources. The Romans, on the accession of Justin, complained of the exactions of Narses, and that Emperor is said to have deprived him of his office. He is accused of secretly intriguing with Alboin, King of the Lombards, to incite a new invasion of Italy, at the same time submissively offering his services to the Emperor for the purpose of repelling the invasion. This account, however, seems improbable; and as Narses died at Rome in 568, just on the eve of the Lombard invasion, no light is thrown upon this story by the actual events of the war. Consult: Bury, *Later Roman Empire*, vol. i. (London and New York, 1889); Hodgkin, *Italy and Her Invaders*, vols. iv. and v. (Oxford, 1885 and 1895); Gibbon, *Decline and Fall*, edited by Bury (London, 1896-1900). See GOths; JUSTINIAN.

NARTHEX (Lat., from Gk. *ναρθηξ*, *narthēx*, casket, a sort of tall, hollow-stalked, pithy, umbelliferous plant). A part of Early Christian and mediæval churches, situated at the opposite end from the altar and choir, and either just inside or outside the entrance and façade. It had in most cases the same width as the entire church (nave and aisles), but was usually rather short. The term is used especially of Byzantine architecture, the corresponding part in the West being usually called portico or porch. There were two main divisions: (1) the *inner* narthex, which was an integral portion of the interior, within the main façade, and (2) the *outer* narthex, a closed porch attached to the outside of the façade, or with a separate façade.

NARUSZEWICZ, nār'roo-shā'vich, ADAM STANISLAW (1733-96.) A Polish historian and poet, born at Pinsk, Lithuania. He joined the Jesuits in 1748, and was sent by them to France to complete his education. On his return he became professor of Latin at the Vilna Academy. A second journey through France, Germany, and Italy secured for him the directorship of the Collegium Nobilium at Warsaw. Prince Czartoryski introduced him to King Stanislas Augustus, and the two became inseparable. After the suppression of the Jesuit Order, he became bishop, first, of Smolensk, and then of Lutsk. He died at Janow, Galicia. His chief work, the *History of the Polish Nation* (1780-86, new ed., 1859-60), was the first scientific treatise of its kind. It is the result of a critical collation of original documents in the Polish archives, and deals with the period previous to 1386. A democrat in his ideals, he aimed in his history to warn his countrymen against their narrow-minded egotism and the lawlessness and arbitrariness of the nobility. He also wrote a *Life of Chodkiewicz* (q.v.) (new ed., Warsaw, 1805), and a *History of the Crimea* (1787). The *Idylls* (highly sentimental) and *Satires* are the best known of his poetic productions, collected as *Lyrica* (Warsaw, 1778, and repeatedly).

NARVA, nār'vá. A town in the Government of Saint Petersburg, Russia, situated on the river Narova, about 100 miles west-southwest of Saint Petersburg (Map: Russia, C 3). The cathedral (formerly a Lutheran church) contains a fine collection of crosses and crucifixes. The town has a seventeenth-century town hall, an old castle, two gymnasias, a theatre, and a num-

ber of technical schools attached to the extensive cotton and woolen mills in the vicinity. There is a considerable trade in cotton and lumber. Population, in 1897, 16,577—Germans, Esths, and Russians. The town was founded by the Danes in the thirteenth century, and, after being held for a short time by the Russians, passed to Sweden in 1581. Here, on November 30, 1700, an army of about 40,000 Russians under Peter the Great was completely defeated by some 8000 Swedes under Charles XII. In 1704 Peter the Great made himself master of the town.

NARVACÁN, năr'vā-kăn'. A town of Northern Luzon, Philippines, in the Province of Ilocos Sur. It is situated on the main road, and on the proposed northern railroad, a short distance from the coast and about 13 miles southeast of Vigan. It has a population of 16,500, being next to the capital the largest town of the province.

NARVAEZ, năr-vă'ăth, PÁNFILO DE (1470?-1528). A Spanish soldier and 'conquistador.' He was born in Valladolid, and came to America about 1498, and became lieutenant to the Governor of Cuba, Velazquez. In 1520 Narvaez was sent with a body of soldiers to reduce Cortés, then in Mexico, to submission. Landing at San Juan de Ulua, he was surprised one dark night (May, 1520), and seized in his camp by a party under Cortés himself, who then persuaded the soldiers to join in the conquest of Mexico. After about two years of imprisonment at Vera Cruz, Narvaez was permitted to return to Spain. There he secured permission to conquer and govern the territory from Florida to the Rio de Palmas, which is now known as the Rio Grande. He sailed from San Lucas, June 17, 1527, with a fleet carrying six hundred colonists and soldiers, priests, and negro slaves, with a few women. Stopping at Santo Domingo for horses and supplies, about a quarter of his men deserted in order to join in the exodus toward Mexico and Peru. Thence he went to Santiago de Cuba, where he passed the winter, and toward the end of February or early in March, 1528, he finally started toward Florida. After many mischances, on April 14th he anchored near a bay which he named Bahia de la Cruz, and which has been identified with Apalachee Bay and Tampa Bay. Finding little hereabouts to justify settlement, on May 1st the company, now numbering three hundred, started to march through the country, while the vessels were to follow the shore as far as the harbor of Panuco. Hopelessly misled by Indian guides, lost in the tangled morasses, hungry and footsore, helpless against the harrying, pestering attacks of unseen natives, the Spaniards struggled along across the country until September 22d, when, at a point named by Narvaez Bahia de Cavallos, two hundred and forty survivors embarked in five boats which they had built with such rude tools as could be fashioned from their weapons. They followed the coast until (October 31st) they reached the mouth of a mighty river, whose stream carried them out to sea. This was the Mississippi. Here two of the boats, in one of which was Narvaez, disappeared. The others made their way toward the shore, but a storm separated them once more. Only one reached the land. For the fate of the survivors, see NUÑEZ CABEÇA DE VACA, ALVAR.

NARVAEZ, RAMÓN MARÍA, Duke of Valencia (1800-68). A Spanish general and statesman, born at Loja, in Andalusia. In early youth he fought in the war of liberation against the French. In 1822 Narvaez acted with the Liberals and contributed to the suppression of the revolt in the Royal Guards. He withdrew to Loja in 1823 upon the triumph of the Reactionary Party, and lived there in retirement until the death of Ferdinand VII. in 1833. He was engaged in the Basque provinces in 1834, then commanded a division under Espartero, and in November, 1836, routed the Carlist leader, Gomez, near Arcos. He won popularity in these campaigns, and was regarded as the rival of Espartero. In 1838, by acts of great severity, he cleared the District of La Mancha of brigands, and was appointed, in 1840, Captain-General of Old Castile, and general-in-chief of the army of reserve. He took part in the insurrection against Espartero that broke out at Seville in 1840, but was compelled to flee to France. He succeeded in 1843 in bringing about the overthrow of the Government of Espartero, and was made president of the Council and created Duke of Valencia in 1844. He entered upon a thoroughly reactionary policy and revised the Liberal Constitution of 1837. Petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand. But his dictatorial manners alienated even his personal friends, and his Ministry was overthrown (February 10, 1846). After serving as special Ambassador at the French Court, he returned to power in 1847, but soon afterwards quarreled with Queen Christina, and retired from office in 1851. In 1856, on the overthrow of the O'Donnell Ministry, he again became president of the Council. Intrigues of the Court compelled his resignation in 1857. Once more in power in 1864, he was succeeded in the following year by O'Donnell, with whom he suppressed, in 1866, a military revolt in Madrid. He supplanted O'Donnell in the same year, and, despite the efforts of O'Donnell and Prim, retained power until his death, April 23, 1868. See Mazade, *Les révolutions d'Espagne* (Paris, 1869).

NARWHAL, năr'wal (from Swed., *Dan. narhval*, Icel. *nahvalr*, probably from Icel. *nar*, corpse + *hvalr*, whale; so called from the pale

SKULL OF NARWHAL.

The lower jaw has been removed, and the view is of the roof of the mouth, which has been partly cut away to show the deep insertion of the root of the tusk (on the left-hand side) and the abortive tooth on the right-hand side of the upper jaw.

color of the skin). A cetacean of the family Belugidæ, resembling the white whale in form and in the want of a dorsal fin, but remarkably characterized by having no teeth at all, except

two in the upper jaw, supposed to be canines, one and occasionally both of which (in the male) develop into spirally twisted straight tusks, passing through the upper lip, and projecting like horns in front. When, as usually, only one is so produced, it is always the left one. Only one species is known (*Monodon monoceros*), of Arctic seas, where narwhals are often seen in great numbers among the ice-fields, and in the creeks and bays, always active and playful. A mature narwhal is generally about 15 feet in length, besides the tusk, which is from 6 to 10 feet long. The tusk is hollow nearly to the point, and is spirally grooved. Its use is rather conjectured than known; it is probably a weapon of defense, but it may also be used for breaking thin ice in order to breathe, and for killing fish. The remains of skates and other flatfish have been found in the stomach of a narwhal, and it is not easy to imagine how a toothless animal, with rather small lips, could capture and swallow such prey unless the formidable tusk were first employed. Cephalopod mollusks, however, are believed to constitute a principal part of the food. The narwhal is pursued by the Eskimos for food, and for the sake of its blubber, with which the whole body is invested to the thickness of about three inches, weighing nearly half a ton and yielding a large amount of excellent oil. The tusks are also valuable, as they are denser, harder, and whiter than ivory. The kings of Denmark have long possessed a magnificent throne of this material, preserved in the Castle of Rosenberg. Great medicinal virtues were formerly ascribed to the tusks. The animal has been called the 'sea-unicorn.'

NASALS (from Lat. *nasus*, nose; connected with Skt. *nāsa*, OChurch Slav. *nosŭ*, Lith. *nosis*, OPrus. *nozy*, OHG. *nasa*, Ger. *Nase*, AS. *nosu*, Eng. *nose*). A name given to sounds; as *m*, *n*, whose quality is affected by the deflection of the breath from the oral to the nasal passages. The voice is made to pass through the nose by lowering the soft palate and sometimes by closing the oral passage.

NASBY, PETROLEUM V (esuvius). The pseudonym of the American humorist David Ross Locke (q.v.).

NASCENT STATE (from Lat. *nascens*, pres. part. of *nasci*, to be born), *status nascendi*. The state in which a chemical element exists at the instant of its liberation from a compound. The reacting capacity of an element in the nascent state is far greater than in the ordinary state, i.e. some time after it has been liberated. For example, in the gaseous state hydrogen has no action upon ordinary aldehyde; but when sodium amalgam is brought in contact with an aqueous solution of aldehyde, the latter combines directly with the nascent hydrogen, yielding ordinary alcohol. According to most authors, nascent hydrogen is made up of single atoms, while gaseous hydrogen is made up of molecules, each of which consists of two atoms. Others believe that nascent hydrogen is nothing but highly compressed gaseous hydrogen; for, as a matter of fact, it has been shown that highly compressed hydrogen is capable of acting in many respects like nascent hydrogen, and it can also be shown that hydrogen is chemically liberated with considerable pressure. Similar remarks apply also to other elements in the nascent state.

VOL. XIV.—17.

NASCIMENTO, *nās'se-mān'tō*, MANOEL DO (1734-1819). A Portuguese poet and a secular priest. He was summoned to appear before the Inquisition because of certain heterodox practices. He fled to Holland and then to France, where he spent the rest of his life. While still in Portugal Nascimento formed with some seceders from the Arcadia a counter poetical academy (the *Grupo da Ribeira das Naos*), whose members observed the Arcadian system of taking pseudonyms, so that he is known as *Niceno* and *Filinto Elysio*. At Paris (1817-19) and at Lisbon (1836-40) there appeared two separate editions of his *Obras completas*, neither of which is really complete. Consult Pereira da Silva, *Filinto Elysio e sua epoca* (Rio, 1891).

NASCOPI, *nā-skō'pē*. The most northeasterly tribe of the Algonquian stock (q.v.), occupying the interior highland region of Quebec and Labrador, northward almost to Ungava Bay. They are closely allied by intermarriage with the Montagnais (q.v.), and trade at the same stations along the Saint Lawrence. They depend entirely upon hunting and fishing for subsistence, and are still but little changed from their primitive condition. They are supposed to number altogether about 3200 souls.

NASEBY, *nāz'bi*. A parish of Northamptonshire, England, 12 miles east by north of Rugby. Population, under 750. It gives its name to the decisive action of the Civil War between Charles I. and the Parliamentary army under Fairfax and Cromwell, which took place here, June 14, 1645. It resulted in the total defeat of the Royalists, the King being compelled to flee, after losing his cannon and baggage, and nearly 5000 of his army as prisoners.

NASH, ABNER (1716-86). An American official, brother of Gen. Francis Nash (q.v.). He was born in Prince Edward County, Va., but removed to North Carolina, was admitted to the bar, and gained a large practice. He represented Newbern in the First Provincial Congress in 1774, and the next year was a member of the Provincial Council. He was a member of the body which framed the State Constitution in 1776, and was the Speaker of the first House of Commons the next year. In 1780 he was elected the second Governor of the State. His administration was stormy, as the Legislature gave most of his powers to a board of war, and he served but one year. In 1782 and 1785 he represented Jones County in the Legislature, and was elected by that body a delegate to the Continental Congress in 1782-84 and 1785-86.

NASH, FRANCIS (1720-77). An American soldier, born in Prince Edward County, Va. At an early age he removed to Orange County, N. C. In 1771 he served as a captain under Governor Tryon in the campaign against the Regulators. He was a member of the Assembly in 1771, and from 1773 to 1775. He was also a member of the Provincial Congress of 1775, and by it was commissioned lieutenant-colonel of the First North Carolina Regiment in September, and promoted to be colonel, April 22, 1776. This regiment became a part of the Continental line, and in February, 1777, he was made brigadier-general. At Germantown his brigade, which was intended to form part of the reserve, participated in some of the hottest fighting of the day. General Nash

was mortally wounded by a cannon ball, and was buried at Kulpsville.

NASH, Sir JOHN (1752-1835). An English architect. He was born in London, and was a pupil of Sir Robert Taylor. After qualifying as an architect, he spent many years in building speculations, and did not, until 1792, return to London and architecture, in which he speedily rose to eminence. He designed numerous mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London, especially in the Marylebone region, which he helped to transform into Regent's Park. Regent Street, Haymarket Theatre, Langham Place Church, Park Square, and the terraces in Regent's Park are specimens of his designs. The pavilion at Brighton is another of his works. He died at East Cowes, Isle of Wight, May 13, 1835. Nash, notwithstanding his many defects, possessed great power of effective grouping, as may be seen in Buckingham Palace.

NASH, JOSEPH (1809-78). An English water-color painter and lithographer, born at Great Marlow, Buckinghamshire. He is principally known by his water-colors and lithographs, illustrating late Gothic architecture and domestic interiors. His publications include *Architecture of the Middle Ages* (1838) and *Mansions of England in the Olden Time* (1839-49). He also did some views of Windsor Castle. There are sketches by him in the Victoria and Albert Museum, South Kensington.

NASH, RICHARD (1674-1762). An English society leader, better known as 'Beau Nash;' born at Swansea. In 1692 he entered Jesus College, Oxford, but he left before finishing his course, and after a very brief career in the army, entered as a student of law at the Inner Temple in 1693. There he quickly became conspicuous for his good manners, his taste in dress, and his high living. His income being insufficient to meet his demands, he eked it out by gambling and by performing for large wagers such *risqué* exploits as riding naked through a village on a cow. It was the former occupation that in 1705 took him to Bath, then newly become a fashionable watering place. Here was his opportunity. Bath was then a rude little village filled to overflowing with fashionable people who were compelled to pay extravagant rates for miserable lodgings, whose only dancing place was the bowling green, and whose card and tea rooms were canvas tents. Nash set himself to change all this, and in a short time he had succeeded not only in building an assembly house, in procuring decent lodgings, and in reducing the insolent sedan-chair men to humility, but also in making himself the social autocrat of the place. He drew up a set of rules which were enforced on high and low; he practically abolished dueling, and he even assumed the duty of improving the country roads in the neighborhood. During these years his income, principally derived from his partnership in gambling houses and his own skill as a gamester, was large, and he lived in a style befitting 'the King of Bath.' But in 1740 gambling came under the ban of the law, and though Nash managed for a time to evade yielding obedience, new regulations in 1745 left him practically without resources. In this plight, the town, which owed so much to

him, came to his rescue with a pension of £10 a month, and on this he lived until his death. Nash owed but little of his popularity to physical attraction, for, according to Goldsmith, he was large and clumsy, and his features were "harsh, strong, and peculiarly irregular." But he did have "assiduity, flattery, fine clothes, and as much wit as the ladies he addressed." Consult Goldsmith, *Life of Richard Nash* (London, 1762).

NASH, THOMAS (1567-1601). An English pamphleteer, born at Lowestoft, Suffolk, in 1567. He graduated B.A. from Saint John's College, Cambridge, in 1586; traveled in France and Italy; settled in London as an author in 1588; and died obscurely in 1601. His first publication was a sharp review of the state of letters, prefixed to Greene's *Menaphon* (1589). It was followed by a pamphlet in similar vein entitled *Anatomy of Absurdities* (1589). Nash now entered the Martin Marprelate controversy (q.v.), writing abusive satires on the Puritans. He also violently attacked Gabriel Harvey in *Have With You to Saffron Walden* (1596). Of more general interest are his satirical sketches of contemporary manners: *Pierce Penniless, His Supplications to the Devil* (1592); *The Terrors of the Night* (1594); *Lenten Stuff* (1599); and the picaresque novel called *The Unfortunate Traveler, or Jack Wilton* (1594). This last work was the sternest piece of realism that had yet appeared in English fiction. Nash also wrote a comedy entitled *Summer's Last Will and Testament* (printed 1600), and had a hand with Marlowe in *The Tragedy of Queen Dido* (printed 1594). Nash was given to outright speech and sarcastic mirth. He was well read and avowed himself the disciple of Pietro Aretino. He also knew Brant's *Narrenschiff* and the works of Rabelais, as well as English poets, such as Surrey and Spenser. Izaak Walton aptly described Nash as "the master of a scoffing, satirical, and merry pen." Consult his *Complete Works*, ed. by Grosart (6 vols., London, 1883-85).

NASHUA, năsh'ô-ă. An important manufacturing city and one of the county-seats of Hillsboro County, N. H., 40 miles northwest of Boston, Mass.; on the Nashua River, near its junction with the Merrimac, and on several divisions of the Boston and Maine Railroad (Map: New Hampshire, J 10). It has a public library, a United States Fish Hatchery, and Saint Francis Xavier Church (Roman Catholic), one of the finest church edifices in the State. A canal, 3 miles long, 60 feet wide, and 8 feet deep, leading from the Nashua River, furnishes excellent water power for large cotton mills. The manufactures include iron and steel, stationary engines, edge tools, furniture, cotton goods, cards and glazed paper, shoes, refrigerators, ice-cream freezers, registers, sash, doors, and blinds, kits and caskets, boxes, saddlery and hardware, shears and clippers, etc. The government is administered, under the original charter of incorporation (1853), by a mayor, chosen every two years, and a bicameral council, which elects the majority of municipal officers. The school board is independently elected on a general ticket by the people. Population, in 1890, 19,311; in 1900, 23,898. Settled in 1655, Nashua was incorporated as the township of Dunstable by Massachusetts in 1673, was reincorporated by

New Hampshire in 1746, received its present name in 1836, and was chartered as a city in 1853. Consult Parker, *History of the City of Nashua, N. H.* (Nashua, 1897).

NASHVILLE. A city and the county-seat of Washington County, Ill., 49 miles southeast of Saint Louis, Mo.; on the Louisville and Nashville and the Illinois Southern railroads (Map: Illinois, C 5). It is surrounded by a district interested chiefly in farming, cattle-raising, and coal-mining, and has large flour mills and a coal mine. Population, in 1890, 2084; in 1900, 2184.

NASHVILLE. The capital of Tennessee, and next to Memphis its largest city, and the county-seat of Davidson County, 233 miles east-northeast of Memphis and 186 miles south by west of Louisville, Ky.; on the Cumberland River (mainly on the left bank), and on the Louisville and Nashville and the Nashville, Chattanooga and Saint Louis railroads (Map: Tennessee, E 4). It has an area of about $9\frac{1}{2}$ square miles, and is regularly laid out on gradually rising ground, which reaches an elevation of 550 feet above sea level. Macadam is very largely used in the pavement of streets, about 190 miles being laid with this material. There are a number of handsome structures. The State Capitol, situated on a hill, cost \$1,500,000 and is the most imposing building in the city. The grounds contain the tomb of James K. Polk and a statue of Andrew Jackson. Among other notable public edifices are the United States Government building, the court-house, the city hall, the Tennessee School for the Blind, the State penitentiary, and the 'Parthenon.' The Tennessee Industrial School is in Nashville, and about six miles away is the State lunatic asylum. The Hermitage, of historic interest as the home of Andrew Jackson, is some ten miles distant to the east. The national cemetery, a short distance north of the city, has 16,643 graves, 4711 of unknown dead.

Nashville is one of the most prominent educational centres in the South. It is the seat of Vanderbilt University (q.v.); University of Nashville (q.v.), with the Peabody Normal College; Central Tennessee College (Methodist Episcopal), opened in 1866 (colored); Fisk University (q.v.) (colored); Roger Williams University (Baptist), opened in 1865 (colored); Bos-cobel College for women, opened in 1889; and Ward Seminary for women (Presbyterian), opened in 1865. There are also the medical and dental departments of the University of Tennessee, and numerous secondary institutions, among which are Belmont College and Saint Cecilia's Academy. The State library comprises 40,000 volumes; and Watkins Institute, the repository of the collections of the State Historical Society, has the Howard Library of 10,000 volumes. Nashville is the leading industrial city in the State, its manufactures, according to the census of 1900, having an aggregate capital of \$13,173,000, and a production valued at \$18,470,000. First in importance is the manufacture of flour and grist-mill products, the city being the chief centre of this industry in Tennessee. Next in rank are lumber and timber products. There are also extensive manufactories of fertilizers, cotton goods, clothing, saddlery and harness, confectionery, tobacco, soap and candles, foundry and machine-shop products, carriages and wagons,

etc. Nashville controls a large trade in lumber, cotton, grain, and manufactured goods, and, as the distributing centre for a considerable area, has important wholesale interests in groceries, dry goods, drugs, boots and shoes, etc.

The government, under the charter of 1883, last revised in 1901, is vested in a mayor, elected every two years, and a unicameral council, which confirms the mayor's nominations of boiler inspector and of the boards of education and health. It elects the other administrative officers excepting the city attorney, comptroller, treasurer, tax assessor, city judge, and board of public works, these being chosen by popular vote. Nashville spends annually in maintenance and operation about \$1,000,000, the principal items of expenditure being: for schools, \$200,000; for interest on debt, \$167,000; for the police department (including police courts, jails, etc.), \$95,000; for the fire department, \$92,000; and for the water-works, \$60,000. The water-works are owned by the municipality and were built in 1832. The system now comprises about 80 miles of mains and cost more than \$2,000,000. Population, in 1830, 5566; in 1850, 10,165; in 1860, 16,988; in 1870, 25,865; in 1880, 43,350; in 1890, 76,168; in 1900, 80,865, including 3037 persons of foreign birth, and 30,044 of negro descent.

Nashville was first settled in 1780 by a company of pioneers led by James Robertson, and in honor of Governor Abner Nash of North Carolina, was called Nashborough until 1784, when it was incorporated as a town under its present name. Throughout its early years the settlement was almost continually harassed by the Indians, and on April 2, 1783, a large body of Cherokees made a determined but unsuccessful attack. Nashville was chartered as a city in 1806, was the seat of the State Legislature in 1812-15 and again from 1826 to 1843, and became the permanent State capital in 1843. It was occupied by a Federal army in 1862, and in 1864 was the scene of a hotly contested battle. (See NASHVILLE, BATTLE OF.) The centennial of the admission of Tennessee into the Union was celebrated at Nashville in 1896, and the event was further commemorated by a grand exposition opened on May 1, 1897. Many well-known men, including Andrew Jackson, James K. Polk, Gen. Sam Houston, and Thomas H. Benton, made Nashville their home for the whole or a part of their lives. Consult Powell (editor), *Historic Towns of the Southern States* (New York, 1900).

NASHVILLE, BATTLE OF. A battle of the Civil War in America, fought south of Nashville, Tenn., December 15 and 16, 1864, between a Federal army under Gen. George H. Thomas and the Army of Tennessee under Gen. John B. Hood.

When General Hood evacuated Atlanta early in September he moved west into Alabama, hoping to draw General Sherman after him and carry the war back into Tennessee. General Sherman, however, sent General Thomas and a part of his army to oppose General Hood, while he undertook the 'March to the Sea.' General Thomas proceeded to Nashville and assembled the Fourth Corps of the Army of the Cumberland under General Wood, the Twenty-third Corps, Army of the Ohio, under General Schofield, the First and Third Divisions, Army of the Tennessee, under Gen. A. J. Smith, a provisional division including two brigades of colored troops under Gen.

J. B. Steedman, and the cavalry corps under Gen. James H. Wilson, about 55,000 in all. General Hood advancing northward into Tennessee was repulsed at Franklin, November 30th, by General Schofield, who at once retired within the intrenchments at Nashville. On December 2d General Hood appeared before Nashville and offered battle. General Thomas, feeling that his army was not sufficiently unified, delayed, though ordered to fight at once by the authorities at Washington. On December 15th he advanced from his intrenchments. The cavalry was placed upon the right of a great curve, the Sixteenth Corps next, the Fourth Corps was the centre and the pivot, the Twenty-third Corps, as a reserve, was to the left, and the Provisional Division was at the extreme left. General Steedman attacked Cheatham's corps on the Confederate right, but was repulsed; but Gen. S. D. Lee in the centre and General Stewart on the left were driven back and some unfinished works captured. Late in the day General Schofield with the Twenty-third Corps was moved to the Federal right. During the night General Hood formed Cheatham's corps on the left. No change was made in the Federal arrangement. On the morning of December 16th the Fourth Corps made an unsuccessful attack on Overton's Hill on the Confederate right, but Cleburne's old division was transferred from the left to strengthen the right. General McArthur, of the Sixteenth Corps, assaulted General Bate's division on the Confederate left, and pierced the line. At this moment some of Hatch's cavalry, which had made a long detour, attacked the Confederate rear and soon the retreat became a rout along the whole line. General Forrest with the Confederate cavalry came up and covered the rear. General Hood with the fragments of his army retreated across the Tennessee River, and on January 14, 1865, asked to be relieved from the command. The Federal troops actually engaged numbered about 45,000; the Confederate about 25,000. The Federal forces lost in killed, wounded, and missing 3057. The Confederate losses in killed and wounded were not given, but 4462 were taken prisoners. Consult: Hood, *Advance and Retreat* (New Orleans, 1880); Johnson and Buel (ed.), *Battles and Leaders of the Civil War* (New York, 1887); and Cox, *March to Sea* (New York, 1882).

NASHVILLE, UNIVERSITY OF. An educational institution at Nashville, Tenn., chartered as Davidson Academy in 1785 by the State of North Carolina, and as Cumberland College in 1806 by the State of Tennessee. In 1826 the name was changed to the University of Nashville, and it became in time one of the leading colleges of the Southwest. During the Civil War the institution was closed. In 1875 the trustees of the Peabody Fund and of the university united in establishing a school for the training of teachers. (See **PEABODY NORMAL COLLEGE.**) The university has a collegiate department with an attendance in 1902 of 577, a medical school with 310 students, and a preparatory department (Montgomery Bell Academy and Winthrop Model School) with 303 students. The faculty numbered 65. The library contained 16,000 volumes. The college buildings and campus of 16 acres were valued at \$200,000; the endowment was \$106,000, and the gross income was \$80,000. At

the same time the total value of the university property was \$325,000.

NASIK, nā'sik, or **NASSICK**. The capital of a district of Bombay, British India, on the Godavari River, 95 miles northeast of Bombay (Map: India, B 5). Owing to its proximity to Trimbak, 19 miles distant, the source of the sacred Godavari, Nasik is one of the holy towns of India, and rivals Benares as a place of pilgrimage. It is the chief seat of Brahmanism in the Deccan. The town is built on both sides of the river, the portion on the right bank divided into the old and new town, being spread over three hills; Panchwati, the quarter on the left bank, contains the principal features of interest. The river is lined with temples, shrines, and ghats for devotional ablutions. Nasik is the chief seat of the copper and brass industry in the province, and is noted for its artistic productions; it has also manufactures of cotton and paper. Four and a half miles to the south are the celebrated Lena Caves, situated in a conical hill, about 450 feet from its base. They were excavated probably in the second or third century A.D., and contain several rudely sculptured figures, the leading ones representing Buddha. The town is the Nasica of Ptolemy. It was long the capital of a Mahratta principality. Population, in 1891, 24,429; in 1901, 21,490.

NASMYTH, nā'smith, JAMES (1808-90). A Scotch engineer and inventor. He was born at Edinburgh, where he received his education at the high school, the school of arts, and the university. As a youth he was an expert mechanic and constructed models of steam-engines and other machinery. In 1829 he became assistant to Henry Maudsley, a London engineer, from whom he derived much useful knowledge and experience. In 1834 he began the manufacture of machine tools at Manchester, where his business rapidly increased and developed into the well-known Bridgewater Foundry. In 1839 he invented the steam hammer, which he improved from time to time. He was also the inventor of many important machine tools, including a hydraulic punch and a steam pile-driver, and he was the first to propose the use of a submerged chain for towing boats on rivers and canals, and of chilled cast-iron shot. In addition to his work as a mechanical engineer he was much interested in astronomy and made many observations with reflecting telescopes which were constructed and mounted according to his ideas. His astronomical work includes investigations of the surface of the sun and moon, which form the subjects of several papers, which were published in elaborate form. Consult *James Nasmyth: An Autobiography*, edited by Smiles (London, 1861-62).

NASE ED-DIN, nāsīr ʿed-dēn' (1829-96). A Shah of Persia. On the death of his father, Mohammed Mirza, September 10, 1848, he ascended the throne. At his accession he found the country in confusion, but by the aid of his Vizier, Mirza Taki Khan, he established himself firmly, and proceeded to carry out numerous reforms. These plans were unfortunately interrupted by the new Vizier, who was an enemy of all progress. Against the Turkomans and other neighboring peoples Nasr ed-Din was successful, but in 1871 the English put a stop to whatever

thoughts of further conquest he may have entertained by defining the boundaries between Persia and Afghanistan. The Shah made three tours of Europe, in 1873, 1878, and 1889. Nasr ed-Din introduced many reforms into his kingdom, and his long reign of forty-eight years has but one serious blot on it, the persecution of the Babis. He was assassinated in 1896, and was succeeded by his son, Muzaffar-ed-Din.

NASS, nās (properly NASQA, corruptly NISH-GAR). A group of tribes related to the Chimesyan, but speaking a distinct language, residing on the Nass River and the adjacent territory in Northwestern British Columbia. They are a maritime people, and their culture is that of the other peoples of the Northwest coast. Their population is 800, in seven villages. Morally and intellectually the Nass are steadily improving, but in numbers they are barely holding their own. About one-half are reported as Christianized.

NASSAU, *Ger. pron.* nās'sou. Formerly a German duchy, now a part of the Prussian Province of Hesse-Nassau (q.v.). The districts now known by the name of Nassau were anciently occupied by the Alemanni (q.v.). They subsequently became a part of the Frankish realm. After the partition of the Carolingian Empire in the Treaty of Verdun (843) the present Nassau was a part of the Kingdom of Germany and was included in the Duchy of Franconia. About 1100 the Count of Laurenburg built the Castle of Nassau, from which his descendant Walram I. took the title of Count of Nassau about 1160. In the middle of the thirteenth century Walram's two grandsons, Walram II. and Otho, became the founders of two separate lines, ruling respectively in the southern and the northern parts of the country. The descendants of Walram II. continued to rule in Nassau until 1866. His son Adolphus was King of Germany from 1292 to 1298. His later descendants established several separate lines, but by the successive extinction of other branches the Nassau-Weilburg family was left as the sole representative in 1816. In 1806 the territories of the line of Nassau-Usingen had been erected into a duchy. In 1835 Nassau joined the Zollverein. Duke Adolphus of Nassau (1839-66) had many difficulties with his subjects, who chafed under his conservative tendencies. He sided with Austria against Prussia in 1866, with the result that Prussia took possession of Nassau. (See GERMANY.) In 1890 the Grand Duchy of Luxemburg passed to the Duke of Nassau.

The younger line of Nassau was founded by Otho I. (died about 1292), who in the division with his brother received the northern part of the country. From this line have sprung the Stadtholders and royal sovereigns of Holland. This junior branch of the House of Nassau acquired possession in 1544 of the Principality of Orange in the person of William the Silent, the great leader of the Dutch in their struggle for independence, who assumed the title of Prince of Orange. With the death of William III. of England and Holland in 1702 Orange passed out of the House of Nassau, but the princely title derived from the little State was retained by his successors, and the reigning dynasty in the Netherlands is still styled the House of Orange. Consult Schliephake, *Geschichte von Nassau* (7 vols., Wiesbaden, 1864).

NASSAU, nās'sq. The capital of the Bahama Islands, situated near the eastern end of the island of New Providence (Map: West Indies, J 2). Owing to its salubrious climate, Nassau is a winter resort for invalids, chiefly from the United States. The town is well laid out, has handsome public buildings, a cathedral, and the only good harbor in the Bahamas. The people are engaged in agriculture, and carry on considerable trade in cotton, fruit, sponges, and salt. Population, 11,000, chiefly negroes. Founded by the English in the seventeenth century, Nassau was destroyed by the French and Spaniards in 1703, but was rebuilt fifteen years later. In 1740 it was made a fortified port, open to free trade.

NASSAU, nās'sou, JOAN MAURITZ VAN, Count of Nassau-Siegen (1604-79). A Dutch soldier and governor. He early distinguished himself in the service of Holland at the sieges of Breda (1625) and Maastricht (1632). From 1636 to 1642 he was Governor of the Dutch possessions in Brazil. Under his rule the colony was notably prosperous. He defeated the Spanish and Portuguese fleets in 1640, and continued to attack these powers with varying success, until his return to Holland. In 1647 he was made Governor of Cleves, and as Ambassador from Brandenburg arranged the treaty of 1661 with England. Placed at the head of the army of the Netherlands, he repulsed the Bishop of Münster (1665). In 1671 he became field-marshal, took an active part in the war against Louis XIV. in the Spanish Netherlands, and was made Governor of Utrecht (1674).

NASSE, nās'se, ERWIN (1829-90). A German economist, one of the most prominent representatives of the 'Socialism of the Chair.' He was born and educated at Bonn, and became professor there in 1860. From 1869 to 1879 he was a member of the Prussian Lower House, and in 1889 was appointed to the House of Peers. One of the founders of the Verein für Socialpolitik, he was its president from its institution until his death. His writings, which were marked by unusual clarity of style, include: *Ueber das preussische Steuersystem* (1861); *Die preussische Bank* (1866); *Ueber die mittelalterliche Feldgemeinschaft in England* (1869; trans. by Ouvry, 1871); and *Agrarische Zustände in England* (1884).

NAS'SICK. A town of India. See NABIK.

NAST, THOMAS (1840-1902). An American illustrator. He was born at Landau, Bavaria. His parents emigrated to America in 1846, and when only fourteen years of age he was employed as a draughtsman on *Frank Leslie's Illustrated Newspaper*. He went to England in 1860 and then traveled to Italy to follow Garibaldi, making sketches of the war, which appeared in the *New York Illustrated News*, the *Illustrated London News*, and *Le Monde Illustré*. Returning to America, he formed a connection with *Harper's Weekly*, which was continued for many years. In 1862 his drawings of scenes from the American Civil War, published in Harper's periodicals, attracted wide attention. His caricatures of public men were pointed and severe, and he in his drawings did as much probably as any verbal vituperation of the newspapers to break up the corrupt Tweed 'ring.' He started the publication of *Nast's Illustrated Almanac* in

1872, and illustrated *The Tribute Book*, Nasby's *Swinging 'round the Cerkle*, and other works, including Dickens's *Pickwick Papers* and *Pictures from Italy*. He was also a clever painter in oil and water colors, remarkable for quickness of conception and facility of execution. Though he was not as good a draughtsman as the great French caricaturists, his pictures are fine examples of strong realism. Among his chief oil paintings are: "The Departure of the Seventh Regiment" (1861); "The Civil War;" "The Last Drip." In 1894 he was called to the *Pall Mall Magazine*, London. On May 1, 1902, he was appointed consul-general to Guayaquil, Ecuador, where he died on December 7th of the same year.

NASTURTIUM. See CRESS; *TRIOPELUM*.

NA'SUA. See COATI.

NATAL, na-täl'. A colony of Great Britain on the southeast coast of Africa, bounded by the Transvaal Colony, Portuguese East Africa, the Indian Ocean, Cape Colony, Basutoland, and the Orange River Colony (Map: Transvaal Colony, G 8). Its area, including Zululand and the portion of Transvaal annexed in 1902, is 31,307 square miles.

TOPOGRAPHY. Natal occupies a part of the seaward slope of the great South African plateau, which falls in a series of terraced escarpments running parallel with the coast around the southern end of the continent from the mouth of the Orange on the west to that of the Limpopo on the east. The ranges culminate in the Drakensberg (q.v.), which forms the natural boundary of the great inland plateau. The average height of the Drakensberg is 9000 feet, and its highest point in Natal, the Montagne aux Sources, has an altitude of 11,155 feet. Below the last ridge of the escarpment is a low coastal plain which widens northward, where it contains a series of large, shallow lagoons, of which the largest is Lake Saint Lucia, 55 miles long and 10 miles wide. Natal is watered by numerous permanent rivers of great volume, but, owing to the enormous fall of 8000 to 9000 feet in less than 300 miles, they are all violent mountain torrents falling in a series of cataracts to the sea. The largest is the Tugela.

CLIMATE. The warm Mozambique current flowing along the southeast coast of Africa gives off considerable amounts of moisture, which is blown up the mountain slopes, giving the whole of Natal a sufficient rainfall. The annual precipitation along the coast is about 44 inches, while in the elevated interior it is much heavier. In regard to temperature, Natal presents a series of climatic zones, from the subtropical coastal region with a mean temperature of 68° to the frigid highland region. The former, however, is tempered by cool southeast storms, and the latter by the hot winds from the interior.

FLORA. The flora is characterized in general by richness and variety. In the coastal region we find the tropical euphorbias, bamboo, cotton, indigo, sugar-cane, coffee, fig, and cocoanut; in the middle zone the common European cereals, fruits, and vegetables flourish, while higher up are good pasture-lands.

FAUNA. Nearly all the large wild animals which formerly overran the country have disappeared. Snakes are still found near the coast, including the python, the puff-adder, and the venomous cobra.

MINERALS. There are extensive coal measures, especially around the headstreams of the Tugela, the output being considerable. Iron ore abounds in many localities, and valuable deposits of argentiferous lead and copper ores, as well as gold, have been found.

AGRICULTURE. The interior of the colony is well adapted for agricultural and pastoral purposes. The total area under cultivation in 1900 was over 600,000 acres. The principal cereal is corn, which constitutes the staple food of the natives. Tea is extensively cultivated, the annual crop exceeding 1,000,000 pounds. Sugar is also increasing in importance, and tropical fruits are cultivated with success. The live stock of the colony consisted in 1900 of 54,485 horses, 349,607 horned cattle, and 586,489 sheep.

COMMERCE. Natal is as yet without manufacturing industries. Its maritime position in close proximity to the two interior colonies of Orange River and Transvaal, with which it is connected by rail, naturally gives Natal a considerable transit trade. The chief exports are wool, sugar, coal, hides and skins, and gold; principal imports are haberdashery and articles of apparel, metals and metal products, machinery, beverages, and textiles. The total value of the imports and exports amounted in 1901 to \$45,855,920 and \$23,337,512, respectively. This was somewhat above the normal.

The sea-borne trade passes entirely through Durban (q.v.). The transportation facilities are adequate. The railway lines, all owned, with one exception, by the Government and operated by it, had a total length of over 600 miles in 1901. The cost of the lines up to the end of 1900 was \$38,026,012. The net earnings of the Government roads exceed 4 per cent. on the capital invested.

In accordance with the provisions of the present Constitution, dating from 1893, Natal is administered by a Governor, who is appointed by the Crown, and is assisted by a Cabinet of six ministers and a legislative council of twelve members, appointed by the Governor for two years with the advice of the Cabinet. The Legislative Assembly consists of thirty-nine members (including two for Zululand), elected for four years by a restricted suffrage. In 1899-1900 the revenue and the expenditures of the colony amounted to \$9,188,278 and \$9,693,843, respectively. The chief item of revenue is customs duties. The public debt amounted in 1900 to \$43,923,226.

Education is neither compulsory nor free, and a considerable proportion of the European children are educated in private schools. The school attendance of the European children amounts to about 96 per cent. of the total school population. In 1900 there were 186 schools for native children, with a total attendance of over 10,600, and 30 schools for Indian children, with an attendance of about 2900.

The population of the colony increased from 361,587 in 1879 to 543,913 in 1891, and to 929,970 in 1900, the latter gain being due partly to the annexation of Zululand in 1897. The European population increased from 22,654 in 1879 to 64,951 in 1900. Capital, Pietermaritzburg (q.v.).

HISTORY. The coast of Natal was first sighted on Christmas Day, 1497, by Vasco da Gama, who named the country in honor of the day

(Nativity). The first attempt at settlement made by the Dutch about 1720 proved unsuccessful. In 1824 Captain Farewell and his twenty companions concluded a treaty with Chaka, King of the Amazulus, who had overrun the region during the first decade of the century, but in 1828 the English colony was broken up by Dingaan, the successor of Chaka. In 1835 Captain Gardiner obtained a concession of land from Dingaan and established himself with a number of missionaries at Durban. Two years later the Dutch of Cape Colony, who, in disgust with British rule, had set out in 1835 on their great trek northward, entered the confines of Natal. The first band of pioneers, numbering seventy-nine men under Pieter Maurits Retief, were treacherously murdered by Dingaan, but the tide of Boer immigration continued unchecked, the Zulu power was broken in a great battle on the Blood River, December 16, 1838, and in 1839 the Republic of Natal was organized, comprising the districts of Pietermaritzburg, Weenen, and Durban. Great Britain, however, continued to regard the Afrikaners as her subjects, and annexed the Republic to Cape Colony in 1843. The greater part of the Boer population trekked westward and northward to found the Orange Free State and the Transvaal. In 1856 Natal was made an independent colony. In 1879 war was carried on against Cetewayo, King of the Zulus; his territory was overrun and occupied; and in 1897 Zululand was annexed to Natal. In 1881 the Transvaal Boers entered the extreme northwestern corner of the colony and defeated the British at Majuba Hill (q.v.). In 1899 and 1900 northern Natal was the scene of fierce fighting between the British and the Boers. At Elandslaagte, Glencoe, and Ladysmith, and all along the line of the Tugela, the most obstinate and sanguinary battles of the war occurred.

NATAL. The capital and chief port of the State of Rio Grande do Norte, Brazil, situated on the Atlantic coast, 140 miles north of Pernambuco (Map: Brazil, K 5). The estuary which forms the harbor is obstructed by sand bars. Still the port is the chief outlet for the products of the State, and it exports cotton, leather, rubber, woods, and sugar. It is the seat of a United States consular agent. Population, about 6000.

NATALIE, ná'ta'le' (1859—). A Queen of Serbia, the daughter of a Russian officer named Keshko. In 1875 she married Prince Milan, afterwards King of Serbia, but their married life was unhappy, and in 1888 Milan procured a divorce. After King Milan's abdication in 1889 she returned to Belgrade and remained for some time with her son, King Alexander, but

the National Assembly having requested her to leave the country in the interest of internal harmony, she withdrew in 1891, though with the masses of the people she enjoyed immense popularity, owing partly to her beauty. In 1893 she became reconciled to King Milan. In the following year she was restored by royal decree to all her rights as a member of the royal family, and in 1895 she returned to Belgrade and was received with great enthusiasm. Since then she has mainly lived in Biarritz, France. In 1902 she joined the Roman Catholic Church. After the assassination of her son Alexander, in 1903, she was forbidden to enter the Kingdom of Servia.

NA'TANT. A term in heraldry. See **NA'ANT**.

NATCHEZ, năch'ez (from their native name, *Na'chi*). An interesting tribe, constituting a distinct linguistic stock, originally residing in nine villages in the vicinity of the present city of Natchez, Miss., with a total population of perhaps 2500. Although comparatively a small tribe, they exercised a commanding influence from the Gulf to the Ohio. Their greatest religious rites were connected with the worship of the sun. They were sedentary and agricultural, expert basket-weavers and skillful potters, while their men bore a deserved reputation as proud and determined warriors. In 1716 they quarreled with the French, who had without their consent erected Fort Rosalie in their country. In 1722 a fight occurred at the post, in which several were killed on both sides. Other collisions followed, until the Natchez secretly organized a combination of several neighboring tribes to drive out the white intruders. On November 28, 1729, the Natchez fell upon the garrison and massacred two hundred men, only twenty escaping, besides making prisoners of all the women, children, and negro slaves. The war rapidly spread to the outlying settlements, but after a few weeks the Natchez, unable to oppose the French and their Indian allies, fled across the Mississippi and fortified themselves in stockade forts on Black River, La. Here they were attacked in January, 1731, by a strong French force, which succeeded in taking nearly 450 prisoners, the rest escaping during a storm at night. All the prisoners were sold as slaves in the West Indies. The remnant, made desperate by defeat, continued the war, but were obliged to give way before fresh Spanish reinforcements from the west. This ended the war, in which they had probably lost half their tribal population. The survivors took refuge with other tribes, some with the Chickasaw, others with the Creek and Cherokee. A part of them under the name of 'Notchee' even found their way to South Carolina and were incorporated with the Catawba.

NATCHEZ. A city and the county-seat of Adams County, Miss., 100 miles southwest of Jackson; on the Mississippi River, and on the New Orleans and Northwestern and the Yazoo and Mississippi Valley railroads (Map: Mississippi, C 7). It is built largely on a bluff, 200 feet above the river, the summit of which contains the most costly residences, and the base, or water front, the principal shipping and business houses. Among noteworthy features of the city are the fine Memorial Park, Fisk Library, Stanton College, Natchez Institute, Institute

Hall, Temple Opera House, Pearl and Natchez hotels, and the handsome court house and city hall buildings. A national cemetery, on a bluff adjoining the city, contains 3150 graves, 2790 of unknown dead. In the cemetery is an observatory which commands good views of the vicinity. Natchez has steamboat connection with the whole Mississippi Valley, and is the shipping port of a large cotton region, exporting annually many thousand bales. There are cotton mills, cotton compress, cottonseed oil mills, a foundry, saw and planing mills, an artificial ice plant, etc. The government is administered under a charter of 1877, which provides for a mayor, chosen biennially, and a unicameral council that elects the school trustees. Population, in 1890, 10,101; in 1900, 12,210.

In 1716 Bienville built Fort Rosalie on Natchez Bluff. In November, 1729, the place was destroyed, and most of its inhabitants were massacred by the Natchez Indians. In 1763, according to the terms of the Treaty of Paris, the English took possession and renamed the fort Fort Parmure. From this year dates the real foundation of the village. A Spanish force from New Orleans dispossessed the English in 1779, and in 1798 Spain gave way to the United States. Natchez was incorporated as a city in 1803, and was the capital of Mississippi from 1798 to 1820. It suffered considerable damage from a tornado in 1840. The city was shelled by Commodore Porter in 1862, and in 1863, soon after the fall of Vicksburg, it was occupied by Federal troops, and remained under their control until the close of the war.

NATCHEZ, ná'chá', LES. A romance written by Chateaubriand during his exile in England, and printed in 1825-26. It contains the author's impressions of America and views of life, and is pervaded by a morbid psychology.

NATCHITOCHES, ná'ch'á-tóch'áz. A tribe of the Caddoan linguistic family of Indians, living formerly on the Red River in Louisiana. Each clan lived apart and they were scattered among the Sioux from Dakota to the Gulf. Their habit of life was partly hunting, partly agricultural. They dwelt in permanent houses covered with sod. In some of their kindred tribes rude pottery was also made. Their religion demanded under certain conditions the sacrifice of human beings.

NATCHITOCHES, ná'ch'á-tósh'. A town and the parish seat of Natchitoches Parish, La., 63 miles southeast of Shreveport; on a branch of the Red River, and on the Texas and Pacific Railroad (Map: Louisiana, B 2). It is the seat of a Roman Catholic bishop, and has a State normal school, a State high school, and a Roman Catholic convent. The town is surrounded by a productive district, devoted to stock-breeding and agriculture, its chief products being cotton and sugar-cane. Natchitoches owes its origin to a trading post established in 1714 by the French. Population, in 1890, 1820; in 1900, 2388.

NATHAN'AEI (Heb. *Néthan'el*, God gives). A man of Cana in Galilee, brought to Jesus by Philip, and declared by Jesus to be a true Israelite and a sincere, open-minded man. He proved this sincerity by coming to meet Jesus, although the fact that Jesus was described as 'of Nazareth' was naturally repugnant to him. He accepted the claims of Jesus as Messiah when

those claims were brought clearly before him (John i. 45-51). From this time on nothing more is said of Nathanael in the Gospels, except the mention of him as one of seven to whom Jesus manifested himself after the Resurrection (John xxi. 2). He is not named among the Twelve Apostles. This fact has led many to attempt to identify Nathanael with Bartholomew (q.v.).

NATHAN DER WEISE, ná'tan dér ví'ze. A dramatic poem by Lessing, published in 1779, in which the author clothed in poetic form the principles underlying his controversial writings. The interest of the drama concentrates itself in the seventh scene of the third act, in which Nathan, the Jew, summoned by Sultan Saladin, to express his opinion as to which of the three religious creeds professed in Palestine he holds to be the true one, recites the parable of "The Three Rings," purporting to show that the true religion is to be known only by its fruits. The drama is based upon the story of *Melchisedec the Jew*, in Boccaccio's *Decamerone*. The character of Nathan is a monument to Lessing's friend Moses Mendelssohn, the Jewish philosopher.

NATICA (Neo-Lat., from ML. *naticæ*, from Lat. *natis*, buttock). A genus of gastropod mollusks, represented by *Natica heros* (now *Polynices heros*), one of the most common and largest of the univalves, and to be found in abundance along our coast from New Jersey to Maine. The shell is large, composed of several whorls, with a small flattened spire or apex. The aperture is large, lunate in shape, and can be closed by a large horny door or operculum. The animal lives partly buried in the sand, near low-water mark. On taking it up the large, round swollen 'foot' or creeping disk ejects a spray of water as if poured from the 'rose' of a watering-pot. The animal has two short, broad, flattened tentacles, but, owing to its burrowing habits, its eyes are wanting. Its eggs are laid in a large,

WHITT SNAIL (*Natica heros*).

a, The shell; b, an egg case; c, animal, with distended foot, in the attitude of walking.

thin circular mass, like a miniature lamp-shade, which is a curious object and a good deal of a puzzle to young collectors. Another common but much smaller snail (*Polynices triseriata*) is thought to be the young of this species. It is marked with three rows of bluish or chestnut-brown spots. A rather more southern species is *Polynices duplicata*, in which the umbilicus (open in the other species) is closed or nearly so.

Consult Arnold, *The Sea Beach at Ebb-Tide* (New York, 1901).

NATICK, ná'tík. A town, including several villages in Middlesex County, Mass., 17 miles west-southwest of Boston; on the Boston and Albany Railroad (Map: Massachusetts, E 3). It has public parks, in one of which is a soldiers' monument, and in another a monument to the memory of John Eliot; the head of Cochituate Lake, one of the sources of Boston's water supply; the Walnut Hill School for young ladies; the Morse Institute (public library and reading room); and the Bacon Public Library. The principal industries are the manufacture of boots, shoes, shirts, clothing, baseballs, boxes, saws, etc. The government is administered by town meetings. There are municipal water-works. Population, in 1890, 9118; in 1900, 9488. Natick was founded by John Eliot, who about 1651 brought hither from Nonantum a company of 'praying Indians,' and for many years it was almost exclusively a settlement of Indian converts. It was incorporated as a town in 1781. Consult: Bacon, *History of Natick* (Boston, 1856); Hurd, *History of Middlesex County, Mass.* (Philadelphia, 1890).

NATIONAL ACADEMY OF DESIGN, THE. A society of American painters and sculptors, whose headquarters is in New York City. The first Academy of Arts in New York City was founded in 1802 by prominent citizens, among whom was only one professional artist, Trumbull, but it excited little interest until 1825, when a secession of the younger artists occurred. Dissatisfied with the character of the old society, they formed a new association, called the New York Drawing Association, directed by practical artists. The present name was adopted in 1828, and the society, composed of thirty members, was incorporated. Prof. S. F. B. Morse (q.v.) was the chief organizer of the movement, and was twice president of the National Academy, in 1827-45 and again in 1861-62. In this capacity he delivered the first lecture on the fine arts ever given in America. The Sketch Club, formed by C. C. Ingham, one of the original members of the National Academy of Design, afterwards became the Century Club (1846).

The National Academy is founded on the plan of the Royal Academy of London, and its active members are divided into academicians and associates, the number being limited to one hundred, the only qualification that they be professional artists. There are also honorary members and fellows of the Academy who have certain privileges. The society is governed by a council consisting of its officers and six members, and the instructors in the school of design are chosen from among its ranks. The Academy stands for the conservative, traditional element in art, as opposed to the more modern sentiments which were represented in the earlier work of the Society of American Artists (q.v.). It held its seventy-eighth annual exhibition in 1903. At these exhibitions the Clarke prize of \$300, and the Hallgarten prizes of \$300, \$200, and \$100, respectively, are distributed, and the Inness gold medal for the best landscape. The school of design connected with the Academy has been in existence since 1825, and the instruction includes classes in the antique, life, still life, anatomy, painting, perspective, composition, etching, and medal and coin engraving. These classes are

open from October until May, and are free to students admitted on the evidence of the school committee. The average attendance of pupils is about 300. Consult Cummings, *Historic Annals of the National Academy of Design* (Philadelphia, 1865).

NATIONAL ACADEMY OF SCIENCES.

An organization incorporated by act of Congress on March 3, 1863, to investigate, experiment, and report on any subject of science or art, when called upon to do so by any department of the United States Government. The membership was limited to fifty till 1870, since when it has never had more than one hundred members at a time; and at the annual elections no more than five names are considered. The members are grouped into committees on: (1) mathematics and astronomy; (2) physics and engineering; (3) chemistry; (4) geology and paleontology; (5) biology; and (6) anthropology. Admission to the Academy is through the recommendation of the committee on the subject in which the nominee is a specialist. There are also fifty foreign associates. Two annual meetings are held. The Academy has prepared a number of official reports on subjects that call for special scientific advice, among which may be mentioned: On the Protection of the Bottoms of Iron Vessels (1864); On the Preservation of the Writing of the Original Declaration of Independence (1879); On the Forest Policy for the Forested Lands of the United States (1897); and Concerning the Value of the Metric System (1902). Several of the members have left funds to the Academy for use in research in various branches of science, and also for medals, of which there are now four that are awarded at intervals. Of these the Draper medal is awarded every two years for the most important discovery in astronomical physics. The Watson medal is given for any astronomical discovery or any astronomical work worthy of special reward; the J. Lawrence Smith medal is awarded to students of meteoric bodies; the Barnard medal is given for discoveries in physical science. The publications of the Academy include seven quarto volumes of memoirs and four octavo volumes of biological memoirs and annual reports made to the Government. The presidents, who are chosen for the term of six years, have been Alexander Dallas Bache (1863-67), Joseph Henry (1867-78), William B. Rogers (1879-82), O. C. Marsh (1883-95), Wolcott Gibbs (1895-1900), and Alexander Agassiz (1901—).

NATIONAL ARTS CLUB. An organization formed in New York City in 1898 "to promote acquaintance among art lovers and art workers in the United States, and to stimulate the practical expression of the artistic sense of the American people; to provide proper exhibition facilities for such lines of applied and industrial art as shall be unprovided for; and to encourage the publication and circulation of new suggestions and discussions relating to the fine arts." A regular feature of the club programme is the holding of monthly exhibitions of works of art. The membership of the club is large and includes men who have won fame in various walks of art, and who are in constant requisition for advice by various associations to whom are committed public and private enterprises in which art largely enters. The principal executive office,

that of managing director, has been filled since the organization of the club by Mr. Charles de Kay.

NATIONAL CHRISTIAN LEAGUE FOR THE PROMOTION OF SOCIAL PURITY.

An organization with headquarters in New York City. Its distinctive aim is the prevention of the extension of vice, (1) by the dissemination of wholesome literature, (2) by the supplying of the physical needs of those who are being rescued from or dangerously exposed to vice, (3) by the establishment of homes for working-girls, and such other means as opportunities present. The work is carried on by special committees. The League has established a home for self-supporting women, where nominal rates only are charged. The League has, also, a hospital committee, whose duty it is to visit the hospitals and assist special cases of charity, and an auxiliary, the Social Culture Club, to improve family life by reaching young mothers and girls. Annual conventions are held.

NATIONAL CIVIC FEDERATION.

An organization formed of a number of prominent representatives of capital and labor, the direct outgrowth of conventions held in Chicago and New York in 1900-01. The object of these preliminary meetings was to secure the fullest possible information as to the methods and measures of arbitration in labor disputes throughout the world, and to consider the best means of promoting industrial peace. At the New York convention, held December 16, 1901, a commission of thirty-six was created to be known as the "Industrial Department of the National Civic Federation," charged with full authority to endeavor by timely mediation to check labor disputes, and as a last resort to end them by formal arbitration. The commission represented equally the employers, the wage-earners, and the public, and among those selected were ex-President Grover Cleveland, President Eliot of Harvard University, and Archbishop Ireland, representing the public; Mark Hanna and John D. Rockefeller, Jr., representing employers; and Samuel Gompers, John Mitchell, and Frank P. Sargent, representing the laborers. The objects to be kept in view by the commission were the adoption of the best means for the promotion of industrial peace; the establishment and maintenance of proper relations between employers and workers; the prevention of strikes and lockouts; the settlement of labor disputes before an acute stage shall have been reached; and, where a rupture has occurred, the application of the best means for the restoration of friendly relations between both parties. The department assumes no power of arbitration unless when such power is conferred upon it by both parties concerned in the dispute. The commission was instrumental in settling eleven strikes from the date of its organization to the breaking out of the anthracite coal strike in 1902.

NATIONAL CONFERENCE OF CHARITIES AND CORRECTION. A body composed of the State boards of public charities, where they exist; of delegates appointed by the Governors of other States; of charity organization societies and associated charities throughout the country; and of persons connected officially or unofficially with charity work. It holds annual meetings in some city determined upon at a

preceding meeting of the Conference. It has no formal constitution.

NATIONAL CONVENTION (in French history). See CONVENTION, NATIONAL.

NATIONAL COVENANT. The league formed by the Scotch Presbyterians in 1638, being one of the famous Covenants (q.v.).

NATIONAL DEBT. See DEBT, PUBLIC.

NATIONAL EDUCATION, SYSTEMS OF. A system of national education may be said to exist wherever the sovereign authority in a nation takes part in the establishment, maintenance, or to any considerable extent the regulation of the agencies for the education of the people. In ancient times and among the antique civilizations that survive to-day State systems of education are found. Such systems are (1) theocratic, where the priesthood, who form a ruling caste or are intimately connected therewith, carry on education; (2) examining, where the State conducts tests for citizenship or official position, thus indirectly determining the character of the instruction; or (3) martial, where the State aims to prepare its youth for citizenship which is practically equivalent to membership in its army. The Roman Government regulated education to some extent, and the emperors endowed many institutions of learning. With the fall of the Roman Empire and the appearance of the mediæval ecclesiastical system, the Church assumed control of education in Europe and resented any encroachment of the State upon its domain. The Reformation, however, by placing wherever it prevailed the control of religion in the hands of the State, transferred to the secular authority the control of education as well. The modern emphasis of the necessity of education for all, not only in religion, but also in letters, led to a broader popular education than had hitherto existed. The multiplication of sects that was an outcome of the Protestant movement brought about so much warfare regarding religious instruction that in most of the advanced nations it has largely or entirely disappeared from the curriculum of the State schools. Thus the modern systems, concerned principally with secular instruction, and controlled by the State, have come to exist.

The development of modern national support and control of education has in general followed this order: first the regulation, then the partial support, and finally the assumption by the State of almost the entire responsibility for the education within its borders. To-day in Prussia 99.5 per cent. of the elementary education is carried on in public schools, and all the secondary and higher institutions are State institutions. Switzerland and Sweden show practically the same conditions. In Italy private elementary schools do 10 per cent. of the work, and in Spain they are a much more significant factor. In England the law of 1902 brings most of the elementary schools of the religious societies under Government control and provides for them a contribution from public funds as liberal as that given to the schools established by the State. Secondary education is also gradually coming under State supervision and provision is being made for national secondary schools. In France the private secondary and elementary schools, the larger part of which were under clerical auspices, have been to a great extent suppressed by the en-

forcement of the Associations Law of 1901. In the United States 8.1 per cent. of all elementary and secondary school attendance is in private schools.

The result of the vigorous efforts of the most progressive States within the nineteenth century is the almost entire disappearance of illiteracy within their borders. Germany, Switzerland, and Sweden find less than 1 per cent. of their conscripts unable to read and write. In Holland, England, and France the proportion of illiteracy grows greater, 4.9 per cent. of the French recruits in 1897 being ignorant of letters. In Italy the percentage of illiterate conscripts in 1899 was 33.8, and the marriage register shows that 50 per cent. of the women called upon to sign it were unable to do so. In Spain the percentage of illiteracy was estimated as 68 per cent. in 1889, and this proportion has probably not been greatly reduced since that date. In the United States in 1890, 13 per cent. of the population over ten years of age could neither read nor write. This large proportion, nowever, is due to the enormous negro population and to extensive emigration from Eastern and Southern Europe. At the same date only seven per cent. of the native population over ten years of age was illiterate. Doubtless the proportion of illiterate adults whose parents were native would in America (if we exclude negroes) be about as small as that of illiterate conscripts in the European States having the most effective systems of popular education. To-day the great problem of popular education is not the abolition of illiteracy, but the training in vocations.

In 1899-1900 20.38 per cent. of the population of the United States were enrolled in elementary schools. Prussia and Switzerland show about the same percentages. Then follow England, Sweden, and France. Italy had only 7.36 per cent. of her population in elementary schools in 1898, while in Russia this percentage was in 1896 only about 3. The United States also leads in the amount expended for elementary education, whether we calculate the rate of expenditure per capita on the total population or per pupil on the enrollment in the schools. The average expenditure per pupil in 1899-1900 was \$20, about double that of England and France, and nearly three times that of Prussia. Italy and Russia spent in 1900 \$5.15 and \$5.12 per pupil respectively. The United States spent on elementary education in 1899-1900 \$2.83 per capita on the total population. Prussia followed with \$1.29 per capita. These comparisons are based on statistics that vary from year to year and are constantly becoming more reliable. In the series "Our European Neighbors" (New York, 1901-03) each volume contains a good brief popular account of the schools of the respective European countries.

FRANCE.

The French system of education affords the best example of centralization and uniformity in educational affairs that the world has seen. It has been built up since the Revolution, and instead of taking charge of existing schools (most of which were clerical) the French Government has established its own system, which has been gradually replacing other educational agencies. The latest act in this drama of rivalry is the active suppression by the State of a large part

of the instruction carried on by religious associations. To this reference will be made later. The present system of elementary instruction may be said to have begun with Guizot's law of 1833, by which each commune was required to establish a primary school and each department a normal school. Not until 1878, however, when the central Government began to grant and loan money to communes for the construction of school buildings, did this law become really effective. The present organic law was passed in 1886.

The system of public instruction in France comprises three departments, primary, secondary, and higher. They are all under centralized control. At the head of the system stands the Minister of Public Instruction, who is a Cabinet officer. Each of the great departments has a special director. The central administration includes, in addition, the Superior Council of Public Instruction, and the general inspectors. The Superior Council consists of about 60 members, and has advisory and judicial functions. One-fourth of its members are appointed by the President. Other vacancies are filled by the Council itself. It has a committee to consult with the school authorities regarding school matters. Officials exist for the inspection of every phase of school work.

For convenience in educational administration, France (including Algeria) is organized into 17 academies. Each one comprises a university, associated lycées, and colleges, and the public primary schools within its limits. At the head are a rector, an academic council, composed of professors and officers of education, and an academic inspector. Under the academic inspectors serve the primary inspectors, who come in direct touch with the schools, each one having supervision of about 150. The departments of France, of which there are 90, constitute the next division for school administration. The prefect has the power of appointing elementary teachers, and there is an advisory council for primary schools composed of teachers, school inspectors, and members of the civic council. In the communes the councils and mayors select sites for school buildings, and vote the funds for the communal school expenditures. There are also committees formed to encourage school attendance.

It has been said that the control of schools in France is highly centralized. The President of the Republic appoints the Minister of Instruction, the general inspectors, the professors in the universities, the rectors of the academies, the prefects of the departments. Of these, the general inspectors have passed a special examination, and professors in the universities are chosen from lists submitted by the Superior Council and the university council. The general inspectors and the rectors are appointed on nomination by the Minister of Public Instruction, and his advice is asked regarding the professors. He appoints the rest of the officials of the central department, the central examination boards, the academy inspectors, the primary inspectors, the secondary teachers, the officials in the normal schools, and in the superior elementary schools. Inspectors are drawn only from the ranks of experienced teachers, who have held important positions. They are required to pass a special examination. So, too, are the professors in normal schools. The primary teachers are required to pass an examination or to be graduates of normal schools.

There are three grades of certificates, elementary, superior, and professional. For the last, stress is laid on knowledge of professional matters, and two years' teaching experience is required. The examination includes a test in actual teaching before inspectors. Only such as pass it can become principals. The elementary teachers are appointed at first on probation by the academy inspectors, and if successful are, on his recommendation, appointed by the departmental prefects. The entire body of educational officials is therefore practically in the hands of the President, the Minister of Public Instruction, and the academic inspector.

The Superior Council deals with programmes for instruction, regulations for discipline, teaching, and school management generally, and hears appeals from the lower councils regarding schools that have been suppressed or have not been sanctioned by the lower authorities. It is the high court of appeal in all contentions. The academic council oversees courses of instruction in either higher or secondary schools, judges cases involving discipline of teachers or pupils therein, or the establishment or suppression of secondary schools. The departmental council has similar functions regarding the primary schools and determines their establishment, location, and the number of teachers. It also inspects them.

By the laws of 1890 and 1896 universities have been organized in each academy. Preparatory to them are State lycées, or classical schools, of which there were in 1900 for boys 109, and for girls 40; communal colleges for boys, of which there were 229; and colleges for girls, numbering at that date 28. All these institutions take both boarders and day pupils. Besides these, there are a number of secondary courses for girls. The primary schools may be grouped under five heads: (1) The *maternal schools*, which receive children between two and six years of age. From being schools for taking care of children whose mothers were out at service, they have become part of the educational scheme. They are supplemented by infant classes, which prepare the children for the elementary schools, and take the place of the maternal schools in small communities. To them are admitted children from four to seven years of age. (2) The *elementary primary schools* (*écoles primaires élémentaires*). These take children from six to thirteen, the work being divided into three grades of two years each. (3) The *superior primary schools* (*écoles primaires supérieures*). The place of these may be taken by the 'complementary courses.' The latter are partly review courses, partly advanced with special attention to training for practical life. In them instruction lasts two years. There are two classes of superior primary schools, the professional and the non-professional. The first class includes commercial, technical, and industrial schools. The second has an advanced, liberal course for three years, supplementing it by considerable technical and industrial work during the rest of the time. It takes pupils from twelve to eighteen. It was originally designed to prepare for the secondary schools, but having a somewhat similar course, and being less aristocratic, it failed. It was revived with the addition of the vocational training in 1886. (4) The *apprentice schools*, which are sometimes classified as superior primary schools. Their name indicates their function,

actual shop work being the centre of the curriculum. (5) The *primary normal schools*. Besides these, there are two higher normal schools, which prepare teachers for the primary normal schools and the superior primary schools. There are eighty-seven primary normal schools for men and eighty-five for women. They give a three years' course. The primary school system is further supplemented by courses for adults offering either elementary, technical, or commercial instruction, or lectures on subjects of general culture.

In the primary schools tuition is free. Moreover, by the law of 1867, a fund to help pupils whose parents cannot supply them with clothes, books, etc., was created. Its establishment in each commune was decreed in 1882, the State agreeing to contribute. It is distributed by local committees, and in many cases children at school are even provided with dinners. In the superior primary schools, bursaries exist to support deserving pupils taking the courses. At the age of sixteen the holders of bursaries may be transferred to secondary schools with a continuation of their stipends. Bursaries also exist in the secondary schools, awarded on examination to students of limited means. Students are admitted to the normal schools on competitive examination. They are supported while there, and, when they graduate, are pledged to teach ten years. They receive positions in the order of merit. Secondary and higher schools charge tuition, but, as they are largely provided for by the State, the amount of this is small.

The salaries of all administrators of schools, inspectors, and, except in the case of the communal colleges and in cities having over 150,000 inhabitants, teachers as well, are paid by the State. This brings about general uniformity. The salaries of primary teachers range from \$200 to \$560 a year; of normal school teachers from \$500 to \$1100; of professors in the lycées from \$640 to \$1800; of professors in the universities from \$2400 to \$3000. In primary schools of all kinds, the teachers are divided, according to length of service and efficiency, into five grades, and in lycées into four. Salaries are based on this ranking. The teachers may, when they have served thirty years, and have reached the age of sixty, receive a pension which amounts to one-sixtieth of the average salary during the last six years multiplied by the number of years served. To make up for this, they contribute to a pension fund 5 per cent. of their yearly salaries plus one-twelfth of their first year's salary and one-twelfth of each increase in salary for the first year of such increase. In addition to paying salaries and pensions, the State supports the normal schools, the buildings for which are erected and equipped by the departments. The departments also furnish the supplies for them, and pay the office expenses incurred in running the departmental bureaux and the academic bureau of inspection. The communes pay for the supplies of the primary schools and local school officials, for janitors, and for the building and equipping of schools and residences for masters. In the building of primary schools, however, a State loan is available, the amount of which depends on the necessities of the commune, and varies from 15 to 80 per cent. of the total cost of the work. The State also loans money to build normal schools. The universities, since their or-

ganization in the academies in 1896, have been thrown somewhat on their own resources and those of their localities. The State no longer equips laboratories or libraries, nor maintains new courses, nor builds new buildings.

The courses of study in the primary schools are in general determined by State laws. In addition, the Minister of Public Instruction, in consultation with the Superior Council, determines the programmes of instruction even in details of considerable minuteness, and also rules for the conduct of the schools. In general, the primary schools give instruction in moral and civic matters, reading, writing, arithmetic (with simple geometry), history and geography (particularly of France), elementary science, drawing, singing, manual work (including needle-work for girls), gymnastic exercises, and for boys, military drill. The superior primary schools have, in addition, algebra and geometry, biological and physical sciences, with applications to agriculture, industries, and hygiene, political economy, the French language and literature, general history, industrial and commercial geography, iron and wood work for boys, and cutting and fitting for girls. One foreign language also is taught. The apprentice, commercial, and technical schools emphasize, of course, work preparing for special vocations. The courses of study for the secondary schools are laid down by law, and were modified in 1890 and 1891 in order to make them conform more completely with modern demands. They were again modified in 1901 and 1902. The entire course occupies eleven years. Four years are spent in the primary department and pupils can take this work in the free primary schools. They will, however, be under the disadvantage of not taking a course of three years in a modern language. The secondary school proper has a course of seven years, divided into two parts. During the first four years the work may be in either of two courses, in one of which Latin is obligatory and Greek optional, and in the other neither is taken. For the last three years there are four courses presented for choice. These courses emphasize respectively Latin-Greek, Latin-modern languages, Latin-science, and science-modern languages. During the last year of the course options in either philosophy or mathematics are offered.

The programmes in all the secondary schools of France are rigidly laid down by statutes and regulations of the central Department of Education, and general uniformity exists.

The system of inspection in France comes in to insure this uniformity in curriculum and methods. It extends to sanitary conditions as well as to instruction, although such inspection is in the hands of the regular medical inspectors of the localities. Uniformity of results is brought about by a regular system of examinations carried on by outside authorities. An examination for a certificate of primary studies may be given to pupils at the age of eleven, and those passing are exempt from further compulsory attendance. It is carried on in the cantons by examiners appointed by the rectors of the academies. A special departmental commission holds yearly an examination for certificates in higher primary studies. The secondary schools also have their final examinations for degrees conducted by outside examiners. Indeed, as the primary schools are the product of the central

republican governments of France, so the lycées are part of the imperial scheme of education devised by Napoleon, and both therefore are characterized by the system, uniformity, and dependence on central authority that their origin would insure.

Private schools in France require the sanction of the State, but can receive no support from public funds. The mayor or academic inspector can oppose them in the interests of hygiene, morals, or public order. They are free in regard to their programmes and methods, but their teachers must have received the certificate of capacity. For the most part, they have been under the control of religious Orders or congregations, and their large attendance was due to the demand for more religious instruction on the part of some classes. These congregations, however, were alleged to be in many cases hostile to the Republic. The Catholic Orders were particularly aimed at in this charge. The Ministry of Waldeck-Rousseau attacked their independence in the 'law of associations' that became a law July 1, 1901. By it all congregations are required to obtain official authorization in order to get legal recognition as such. All unauthorized congregations are absolutely forbidden to give instruction. By this means a careful scrutiny of the conduct of the affairs of such bodies is made possible, and the character of their instruction inspected. The law contemplates the suppression of all congregations that shall resist such scrutiny. During the year 1901-02 the Ministry presided over by Premier Combes compelled many thousands of unauthorized clerical schools to close their doors. In 1903 supplementary legislation to the Association Bill resulted in practically closing all the clerical schools both authorized and unauthorized.

The universities of France are discussed more at length under UNIVERSITY.

GREAT BRITAIN.

The foundation of the present system is the Elementary Education Act of 1870. It declared that each district where sufficient facilities for elementary instruction were not in existence should provide them. Schools requiring denominational instruction or charging more than ninepence a week for tuition were not regarded as providing sufficient means for this purpose. The Education Department was required to make a statement of what was in each case demanded. In case voluntary provision to meet these demands was not forthcoming, a school board was to be elected in the district, which was to provide, to maintain, and to keep efficient the requisite elementary schools. Children attending board schools were to pay a weekly fee determined by the board, with the consent of the department, but this was to be omitted where parents were regarded as unable to pay. School boards were permitted to make provision for the compulsory attendance of children between five and thirteen years of age, who were not elsewhere receiving efficient instruction, unless these children had attained the requisite standard of scholarship, or were exempt under the Factory Acts. The board schools were to give no denominational instruction. The funds for the support of elementary schools were to be at the disposal of the boards, and were to be derived from Parliamentary grants, loans, fees, and local rates.

Power was given to the school boards to fix the amount of the local contribution for school purposes. Voluntary schools, wherever they existed, were recognized as before, and, in case they remained properly public and elementary, were to receive grants not greater than the amount contributed from other sources. Local rates were not to be levied for voluntary schools. In 1876 the age of compulsory education was extended to 14 years, and provision was made for the more effective enforcement of the law by punishing delinquents. This law was also made to apply to districts where there were no school boards, and it was enacted that children under ten years of age should not be regularly employed at labor. In 1880 boards were required to make attendance compulsory. Subsequent legislation has improved the evening schools (q.v.), turning their attention to technical and industrial education, has started undenominational day training colleges, and has greatly developed technical instruction. The poorer rural elementary schools have also received especial help. In 1890 the payment of tuition fees in elementary schools was abolished. In 1899 the Education Department was replaced by a Board of Education for England and Wales consisting of a president, the Lord President of the Council, the principal Secretaries of State, and the Chancellor of the Exchequer. In December, 1902, a far more important measure for the unification of school administration was passed. The occasion for this act was the complaint on the part of the voluntary schools that, while they gave instruction to more children than the board schools (in 1898 about 20 per cent. more), they received no aid from the local rate. The amount that they received from voluntary subscriptions was not sufficiently great to enable them to keep pace with the board schools, a large portion of the support of which was derived from local taxes. The act of 1902, which applies everywhere except to London, changes this condition by sweeping away the old school boards and attendance committees, and replacing them by education authorities, which are empowered to provide for all the schools in their respective districts out of the local rates. Whatever schools receive such support are under the general supervision of the local education authority. This authority is the council of the county or the county borough. It retains the right of levying the local rate and of borrowing money for school purposes, but hands over to a committee all other educational functions. The Education Committee is appointed according to a scheme determined by the local authority and approved by the Board of Education. A majority of its members are in most cases appointed by the council from its own number. Some of the others must be persons of experience in education, and the committee must include women. The Education Committee has power to determine the secular education to be given in the public elementary schools, and to fix the number and educational qualifications of the teachers. Its consent is necessary to the appointment or dismissal of teachers except where religious considerations are involved.

Each school is under a board of managers, who elect teachers, control the school property, etc. The schools provided for wholly by the education authority are governed by managers appointed by

it and by local authorities. Moreover, the denominational schools have on their managerial boards appointees from both these sources. No school that does not comply with the requirements of the Education Committee can receive even a Government grant.

Parliament grants to all schools a sum equal to four shillings per scholar, and an additional halfpenny per scholar for every complete twopence per scholar by which the amount which would be produced by a penny rate in the area of the authority falls short of ten shillings a scholar. Whatever tuition fees are paid to schools maintained by an education authority are turned over to it, but a certain portion of these, such as may be agreed upon, is returned to the managers of the school. The proceeds of school endowments for the aid of elementary education are primarily devoted to the care of the school property. Whatever surplus there may be is turned over to the education authority.

The managers of denominational schools are allowed to determine the religious instruction given therein and the religious qualifications of the teachers. But a pupil need not attend such instruction, and cannot be excluded from the school for religious reasons.

The act of 1902 is bitterly opposed by the Non-Conformists. The voluntary schools are largely under the control of the Church of England, and the use of a local rate for their support was regarded as taxing Non-Conformists for the benefit of the institutions of the Established Church. Moreover, it was feared that the new education committees would be more favorable to the Church of England than the old school boards. The schemes of the councils for the appointment of the committees, however, give, in general, far less representation to the Established Church than was commonly expected.

For the training of elementary teachers in 1898 there were forty-four residential and fourteen day training colleges. The latter are attached to some university or college of university rank. Teachers are appointed by the school boards. The average annual salary of certificated masters is about £121 and of mistresses about £80. In 1898 provision was made for pensioning teachers who have reached the age of sixty-five or have become disabled. The amount is estimated on the basis of length of service, and is partly made up by an annual contribution on the part of men of £3 and of women £2. Inspectors are appointed by the Crown on recommendation of the Education Council. There are for elementary education twelve chief inspectors, two being for training colleges, one senior chief inspector, ninety subordinate inspectors, and a number of sub-inspectors. The pupil teachers constitute a large proportion of the teaching staff, the law allowing three for the principal teacher in each school, and one for every certificated assistant teacher. The system of grants in aid of their training still prevails.

For secondary education England has schools under a variety of authorities. They may be classed, according to method of control, as private enterprise schools, subscribers' schools, companies' schools, endowed schools, and schools under local authorities. There were 6209 such schools in England in 1897. They are not organized under any system, except that the Charity and other commissions have been revising the

courses of study in the endowed schools. (See **ENDOWED SCHOOLS ACTS.**) The Public Schools Act of 1868 revised the control and organization of seven great public boarding schools of England. In 1894 a commission was appointed which in the following year reported an elaborate scheme for the national organization of secondary instruction, but so far no legislation has taken place as a result of this. Wales and Monmouthshire have a system of inspection of secondary schools. One of the main purposes of the act of 1902 was the support of secondary education by public money. The education authorities are authorized to consider within their areas the needs of secondary education and to take such steps as seem to them desirable, after consulting the Board of Education, to supply or aid in the supply of such instruction. For this purpose the county authorities are empowered to raise a county rate of twopence in the pound, a sum that may be increased with the consent of the Local Government Board. This measure is calculated to render far more effective and comprehensive the secondary schools under Government control that were initiated by the science and art department.

The Scotch have had a public elementary system since 1696, when it was ordained that a school should be established in every parish where one was not in existence. The masters were elected by the landowners and the ministers, and held their places for life or good behavior. The act was amended in 1803 so as to require the salaries of masters to be raised, and in 1861 their examination for the right to teach was transferred from the control of the presbyteries to that of the universities. In the meantime considerable support was granted to the schools from the Government. Among other changes, the English School Code of 1861 was applied in Scotland, but was withdrawn. In 1872 an elementary education act like the English one was passed. The Scotch law is the better of the two, however, school boards being created in every parish, and the practical control of all elementary schools being given to them. In 1893, after several movements in that direction, all children between three and fifteen years of age were freed from school fees in the public elementary schools. Education is compulsory for children between five and fourteen years of age.

The Government grants to Scotch voluntary and board schools are, in general, similar to those in England, but only about one-eighth of the elementary schools are voluntary. For the training of elementary teachers, denominational colleges had made their appearance before 1839. These have been aided by Government grants, and at present over four-fifths of the male and two-thirds of the female teachers have graduated therefrom. The English pension act of 1898 was extended to Scotland.

The secondary instruction in Scotland is in the hands of five classes of schools: burgh schools, academies, parochial schools, mixed burgh and parochial schools, and four public boarding schools like those of England. The burgh schools are supported either by endowment or by burgh funds. They are under the control of the authorities of the burgh and open to the community. Until 1861 the presbyteries controlled them, but at that date this power was transferred to the town councils, and in 1872 to the school boards. These bodies fix the fees.

The academies arose in the middle of the eighteenth century as a result of a demand for more economical and scientific instruction. In most cases they came ultimately under the joint control of town councils and proprietors. In 1892 Government grants were made to secondary schools, and their inspection was provided for. For the universities of Great Britain, see **UNIVERSITY.**

For a further treatment of the English educational system, see **GREAT BRITAIN**, section on *Education*.

HOLLAND.

The State school system in Holland includes public primary schools, normal schools and courses, burgher schools, higher burgher schools, or secondary schools proper, agricultural schools, and various professional institutions, together with gymnasia, and three State universities. A few of the primary schools are maintained solely by the general Government. Most of them are communal, but a considerable portion of the fund for their support comes from the State. Private primary schools are also subsidized by the Government, in case they maintain proper standards. The primary school system includes, in addition, repetition and evening schools, and both types are maintained by the same agencies and methods as the primary schools in general. So, too, the normal schools are either Government schools, or communal schools with subsidies, or private schools with similar support. The State normal schools, however, give instruction to the majority of the students taking such courses. The higher burgher schools were, in 1894-95, 61 in number. Of these 20 were maintained by the Government, 28 were subsidized communal schools, 12 were communal schools without subsidies, and one a Roman Catholic institution. Of the 29 city gymnasia, 25 are subsidized by the State. It will be seen, therefore, that the policy of Holland is to subsidize such private and local schools as conform to its requirements in character of instruction and qualifications of teachers, and to found State schools only to supplement and complete the work of these agencies.

The history of this school system will serve to explain these peculiarities, and also to make somewhat clearer the complexities of the system itself. In 1784, a 'Society of Public Good' was founded at Groningen by John Nieurenhuysen. Its object was to promote elementary education; and in this it was successful, receiving help from the Government. In 1806 an education law of great importance was passed. It consisted essentially of provisions for inspecting schools and examining and certificating teachers. School districts were organized, over each of which an inspector was placed, whose consent was requisite before any one could teach or be a member of a school committee. The inspectors received for their services only an allowance for their expenses. A principal duty was that of examining teachers for certificates. The provincial and communal administrations were urged by the Government to provide the means of instruction in their localities, to insure a comfortable subsistence for teachers, and to obtain a regular attendance of children in the schools. Free schools for the poor were, as a result, established in the towns and in the villages, schools to which the poor were

admitted gratuitously. The authorities made great and successful efforts to gain a large attendance, and teachers were paid better salaries than elsewhere in Europe. In 1811 M. Cuvier found 4511 primary schools in existence, and one in each ten of the population in school.

Up to 1848 only two important steps had been taken in the further development of the system. Normal schools were established in 1816, and the free schools for the poor were supplemented by institutions of a somewhat higher grade where a small tuition fee was required. Since the free schools could be entered only by those who possessed a certificate of poverty, the children of people with moderate means were excluded from them. The private schools for such children were fast becoming inferior to the free schools which were under public patronage, and it was to supply this want that the towns established intermediate schools (*tusschen scholen*). In addition, French schools, which emphasized modern languages and commercial branches, and Latin schools, preparing for the universities, were founded. These higher schools, however, did not compare so favorably with those of other countries as did the primary ones.

The Constitution of 1848 established liberty of instruction. This conflicted with the provision of the law of 1806 that the authorizations of the municipal council and of the inspector were necessary for even the teacher in a private school. In 1857 this requirement was removed, only the general admission certificate being demanded in such cases. The Constitution of 1848, also, by placing all religious denominations on a footing of equality, gave to the Catholics and liberals a chance to attack the religious instruction in the schools, which according to the law of 1806 was to have been Christian but undenominational. Their agitation led to a strict enforcement of the law, which in turn roused the antagonism of the orthodox Protestants. The result of a bitter contest was the law of 1857, which reaffirmed that of 1806, making more explicit its provision that religious instruction, while undenominational, should yet inculcate Christian virtues. It was also provided that the schoolrooms should at special hours be put at the disposal of religious communions for purposes of instruction. This attitude has been confirmed by the law of 1878.

The law of 1857 also made definite regulations regarding the number and support of schools, the salary and number of teachers, school fees, the primary curriculum, the selection of teachers and school inspectors. Each commune was required to maintain at its own charge what in the opinion of the State's deputies and the supreme Government was a sufficient number of primary schools. If this task was too heavy, the State and the province were to share equally in a grant of aid. It was provided that pupil teachers should aid in the work of instruction. School fees were to be exacted only of those who could afford to pay them. The subjects of primary instruction were defined to be reading, writing, arithmetic, the elements of geometry, of Dutch grammar, of geography, of history, of the natural sciences, and singing. The public schoolmaster was to be selected by the communal council from a list of those who had acquitted themselves best in a competitive examination. A salaried provincial inspector was substituted for the provincial commission of district inspectors. The Minister

of the Home Department, assisted by a referendary, was made the supreme authority in matters connected with education.

In 1863 a law was passed organizing secondary instruction as consisting of burgher, higher burgher, agricultural, polytechnical, and industrial schools. This law was amended in 1876 and 1879. The secondary schools are under special commissions and inspectors, and teachers in them are required to have special diplomas, and, except in a few cases, to be university graduates.

The law of 1857 has been twice amended, in 1878 and 1889. In 1878 the school authorities were empowered to increase the curriculum as laid down in 1857, by French, German, English, general history, mathematics, drawing, agriculture, and gymnastics whenever they deemed it expedient. It was also provided that each commune should support the necessary number of unsectarian schools; but 30 per cent. of its educational expenditures were to be contributed by the State, which also undertook to subsidize private schools under certain conditions. An enormous increase in the State contribution to popular education was thus brought about. In 1889 the method of granting the State subsidy was modified. If the school applying for one is found on inspection to conform to the State regulations it will be granted an amount dependent on the attendance, the number of teachers, and extent of the curriculum. All schools having more than forty-one pupils must have at least two teachers, and an additional teacher is required for an average addition of about fifty pupils. When schools have more than the minimum requirement of teachers, and when they cover more than the required curriculum, additional grants are given. The State also furnishes 25 per cent. of the amount necessary to establish a school, and regulates the character and hygienic conditions of the buildings and premises. The law of 1878 instituted a system of pensions for teachers who had reached the age of sixty-five. The annual amount is one-sixtieth of the annual salary for each year of service. The teachers contribute 2 per cent. of their yearly salaries to a pension fund.

The Dutch classify their gymnasia together with their universities under the head of superior instruction. Such instruction is organized into a system by the law of 1876. The three State universities are supported and controlled by the national Government. See UNIVERSITY.

PRUSSIA.

The school system of Prussia may be divided into three departments, elementary, secondary, and higher. The elementary system is designed to educate children of the lower classes whose school training is completed with them. The secondary schools are intended to prepare pupils for the universities or professional schools, which are for the most part classed as superior schools. The elementary schools may be grouped under five classes: (1) The *infant schools*. These are not supported by State funds, nor are the teachers required to have State certificates of capacity. They are, however, under the supervision of local school boards. Their purpose is to care for children whose parents are obliged to go out to work. Children are admitted ordinarily only in their third year, but in some cases even younger children are cared for. (2) The *Volks*

schule. This takes children between the ages of six and fourteen, and during this period attendance is compulsory for all whose education is not otherwise provided. In the larger communities the sexes are taught separately, but in the country districts this is usually impossible, on account of the lack of teachers and facilities. The school work occupies six hours a day and about forty-two weeks a year. There are three grades and six classes, though the work occupies eight years. The subjects of study are, in the lowest grade, religion, German, arithmetic, singing, gymnastics, and needle-work; in the middle grade, drawing, science, history, and geography are added; and in the upper grade, geometry. This course is prescribed by law, but within its limits selection and arrangement are left to the school board of the district, subject to the approval of the general board of the royal Government. (3) *The continuation schools*. These are usually evening schools, giving instruction to pupils between the ages of fourteen and eighteen. They review the work of the Volksschule, and give some additional work with special reference to trade or industry, or, in the country districts, agriculture. Tuition is charged, but provision is made for those who cannot pay. With the continuation schools may be classed various industrial and trade schools which are day schools, and devote more time and effort to prepare for specific vocations. (4) *Middle schools*. These sprang from the old burgher schools of the Middle Ages. They aim to prepare the children of people with more means for a commercial life, although sometimes they are attended by pupils preparing for the secondary schools. Tuition is charged. Nearly twice as many of these schools as are public are private. A considerable proportion of them are mixed schools. They take the place of the Volksschule, but sometimes continue instruction until the seventeenth year. (5) *Normal schools*. In these there is a preparatory course of three years to which children of fourteen are admitted. This is followed by a two years' course in the women's normals, and a three years' course in men's normals and the one for governesses. In 1900 there were 126 of these institutions, of which all but about twelve were for men exclusively. Students are admitted on examination and the attendance is limited to from thirty to thirty-six in each class. While in the school students receive their support. On graduation, they are placed on the list of available teachers, and required to take what is given them, or pay back the expenses of their education. Before receiving permanent appointment, however, a probation of from two to five years is required, and an additional examination on educational matters must be passed. The normal school course consists of pedagogics, religion, German, history, arithmetic, geometry, geography, drawing, writing, music, and a foreign language.

The secondary schools in Prussia, as in Germany generally, are the various classes of gymnasias and Realschulen. The gymnasias are the classical schools, and have their origin far back in the Middle Ages. They were modernized during the nineteenth century by the introduction of science and modern languages, although they have always retained the humanistic quality as against the Realschulen, which emphasize the scientific studies and modern languages, and omit the classical languages altogether. The gymnasium

has a nine years' course. To enter it the pupil must be nine years of age, and have had three years of elementary instruction. The progymnasias give a somewhat shorter course, usually only the six years necessary to gain for their graduates exemption from one year of the voluntary service in the army. Occupying a position between the gymnasium and the Realschule is the Realgymnasium, which omits Greek and gives more attention to sciences, etc. There are also real progymnasias. The Realschule proper gives only a six years' course, but the higher Realschulen have nine years of work. As a result of a conference on secondary schools that met at Berlin in 1900, the three classes of schools having a nine years' course are declared to be equal from the point of view of general culture, and Greek was made optional in the gymnasias. The programme of studies was somewhat revised, and greater latitude allowed the masters in adapting their work to particular needs. For the professional training of secondary teachers there are twelve State seminaries, which admit only a few candidates. There are also connected with many of the gymnasias seminaries conducted by the principals and leading teachers. These institutions all give a one year's course. There are also a number of higher schools giving instruction to girls from six to fifteen years of age. They are supplemented by gymnasias having a four years' course. These institutions, however, are not recognized as preparing for the universities, and the higher schools are controlled by the department for primary education.

The higher education of Prussia is given in the universities, with their four faculties of philosophy, theology, law, and medicine. They are discussed in the article on *UNIVERSITY*. There are also various polytechnic and agricultural schools that may be included with the schools for higher education.

At the head of the Prussian school system is the Minister for Religious, Educational, and Medicinal Affairs. As Minister of Education alone, his department is subdivided into two parts. The first has control of superior and secondary instruction, and the second of the elementary schools. The Minister of Education represents the schools in the Prussian Parliament, and plans and oversees legislation on school matters, including finance. He distributes the State school money, appoints the members of provincial school boards, confers titles on school officers, judges on appeal all cases involving dismissal from office or other contentions in school matters, besides fixing the normal course of study. Each of the thirteen provinces of Prussia constitutes a division for school administration. The immediate superintendence of secondary schools is in charge of the provincial school boards, consisting of from three to five members and a chairman, who is the president of the province. One of these men inspects the gymnasias, another the Realschulen, and a third the Volksschulen. This board has the power of appointing and dismissing teachers in secondary schools, except in such as are supported wholly or partly by private funds, where the selection is made by a local board from a list furnished by the provincial school board. The appointment of directors of the schools requires the confirmation of the Minister. To the provincial school boards also fall the control of the seminaries

for the training of secondary teachers, and the regulation, for all the schools of the province, of the school programmes, regulations, leaving examinations, and of text-books for the higher schools. In each province the general superintendent of the Evangelical Church has the function of inspecting the Protestant religious instruction in the secondary schools, and a Catholic bishop has a similar right regarding Catholic instruction. The provinces of Prussia are divided into thirty-six governments, each of which has a school board consisting of two men appointed by the King for life, four appointed by the provincial school board for six years, and the president of the royal Government. In such schools as are supported largely by the State, this board appoints the teachers. Wherever, on account of extensive local support or private patronage, local authorities are given the naming of teachers, the school board of the Government confirms their appointment or nominates a list from which the selection must be made. It also oversees the conduct and work of the teachers, superintends the elementary schools generally, settles upon new districts and text-books for local schools. The governments are divided into districts, some of which have inspectors, whom the Minister on examination appoints for life, and who devote their whole time to the schools. Other districts have a number of local inspectors, who are clergymen or have some other occupation besides that of school inspection. The district has a school board composed variously in different localities of inspectors, members of local councils, and representatives of religious denominations. This board has the power of erecting and organizing schools, determining teachers' salaries (the minimum being fixed by the Government), increasing pensions, and deciding on property liable to a school tax. Each school has a local school board chosen in cities by the central school board. Sometimes, however, it is elected by the citizens of a community or by a church organization or by a patron, depending largely on the source whence the school derives the larger part of its income. The local board looks out for repairs, supplies, and attendance, but cannot interfere with the internal management of the school. In many cases it has a voice in electing the teacher or fixing his salary. Many cities have established secondary schools, the funds for which are largely contributed by them. Here the local boards have charge of financial matters, choice of teachers, etc., but the work of the school itself is under the supervision of the provincial boards. The most extreme cases of local control arise in connection with the country Volksschulen, under the patronage of the nobility. Here the patron names the teacher, and sometimes even interferes with the course of study and school hours.

Private schools in Prussia are required to conform to State regulations, as to minimum course of study, school methods, etc. They are under State inspection, and can employ none but regularly certificated teachers. The number of private elementary schools is insignificant, but the pupils in middle schools are one-third in private institutions.

Teachers in Prussian elementary schools are ordinarily graduates of teachers' seminaries or training colleges. At the end of each year these institutions hold an examination at which the

school inspectors and superintendents of the district and a commission from the provincial school board are present. Practical tests in teaching power are required as well as those on theory. The successful candidate gets a privilege to teach for three years. After two years of satisfactory work a teacher may take a second examination, the passing of which gives him a right to a permanent position and a pension. This examination is largely on educational matters and includes a practical test. Candidates who are not graduates of teachers' seminaries may be admitted to it, and on passing are allowed to teach. The director of the seminary oversees the work of its graduates, and can require them to supply defects by additional work. Those who wish to teach in the higher classes of the middle schools must pass an additional examination given by a special commission, and the same body gives a still further examination to those who aspire to rectorships. To gain the right to teach in the secondary schools a candidate, who is usually from a university, often with a degree, must pass a State examination given by one of the ten examining boards appointed annually by the Minister. Those who pass may receive, according to the character of their papers, any of three grades of certificates in the various subjects, and these entitle them to teach such subjects in the lower three, the lower six, or all the grades of the gymnasium. After passing this examination, a candidate enters either a State seminary (where he receives a valuable stipend) or a gymnasial seminar. Here he is under practical instruction for a year, entering at its successful conclusion on a year of probationary teaching, for which he receives no remuneration. He is then, provided his work is satisfactory, eligible to a permanent appointment.

Elementary teachers receive free rent and fuel, and often a garden. Their annual salaries range from 450 marks (in a few cases even less) to as much as 3800 marks in Berlin, or in the case of rectors even 6000 marks. The average is, however, about 1200 marks, and is smaller in the country than in the cities. Salaries usually are regularly graded, according to time of service, up to a maximum. Women are paid somewhat less than men, and they constitute about 12 per cent. of the total teaching force in elementary schools. After ten years of service the teacher can, if disabled or sixty-five years old, retire on a pension of one-fourth of his salary. This amount increases by one-sixtieth for each additional year of service up to three-fourths of the salary. The pension fund is derived from a State and local contribution, together with a small deduction from the salary of the successor. The annual salaries of secondary school teachers range from 1500 to 5100 marks, and in the case of rectors to 7200 marks. In addition, they receive an allowance for house rent. The same regulations as to pensions that apply to primary teachers apply also to secondary ones, and in fact to most State officials, an exception being professors in the universities.

For the support of schools in Prussia, there are five sources of income. The most important of these is the State itself, which pays about one-half of the total required for teachers' salaries. The other sources are school societies, income from inherited property, Church funds, local

taxes, and tuition. In the city schools the local taxes supply the larger part of the income; in secondary schools the tuition furnishes nearly one-half the sum required for support. The country schools, however, receive over two-thirds of their income from the State, the amount being a fixed contribution of 100 marks for each head teacher, 200 marks for each additional regular male teacher, and 150 marks for each female teacher, with 100 marks for each assistant teacher who is in the probation year. The normal schools are supported by the Government, as are also the universities. In the latter tuition is a considerable item. For their organization, see the article on *UNIVERSITY*.

For the development of the German public educational system, of which the Prussian system is taken as a type, see *GERMANY*, section on *Education*.

SWITZERLAND.

Each of the twenty-five cantons of Switzerland has its own separate and independent school organization, and there are very few federal regulations on the subject. The Federal Constitution of 1874 empowers the Bund to establish and maintain or assist a university or other institution for 'higher education.' This power has not been used except to continue the support of the Federal Polytechnic at Zurich, and to subsidize various cantonal higher institutions. The Constitution further states that all education, whether public or private, must be under the control of the cantons. They must provide for it, and make it compulsory and gratuitous. That they do this well is evident from the fact that in 1898-99 the ratio of attendance to population was greater there than in any other country in the world, while of the recruits in 1899 only .23 per cent. could not read. All attempts to establish anything like a centralized system have met with determined opposition by those who feared interference with linguistic or religious instruction in the schools. Indeed, the problems of education in Switzerland are more complex than in most countries. Some cantons are predominantly French, others are German, others Italian, and there is still a fourth vernacular, Romansch, extensively spoken. In cantons where one language predominates, another is usually the sole one spoken by a considerable part of the people. Moreover, Catholicism and Protestantism are face to face everywhere, and both fear that the free-thinkers might endeavor to exclude religious instruction from the schools if their control were centralized. The Constitution provides, however, that "it must be possible for the public schools to be attended by the adherents of all beliefs without hurting their freedom of belief or conscience." That not more than 3 per cent. of the attendance is in private schools, which are, moreover, patronized almost entirely by children of non-Swiss parentage, attests the satisfactory nature of the religious instruction in the public schools. A few cantons, as Geneva, exclude it entirely from the public system. Three additional Federal regulations affect education. The first forbids the labor in factories of children under fourteen, and limits that of those under sixteen. The second prescribes an examination for every recruit on entering the army at his twentieth year. The results of this are made

known, and it stimulates educational effort, besides bringing into existence improving schools for recruits, and increasing the attendance at continuation schools. The final regulation concerns military drill, which by the acts of 1874, 1877, and 1883 is made a required part of every school programme, to be given to children between ten and fifteen years of age.

At the foundation of the school system of Switzerland we have at present the communal primary schools taking children from six to eleven years of age. After this they go either to the cantonal secondary schools proper, or to the advanced elementary schools, the so-called 'secondary' schools, the district for one of which embraces several communes, or to the communal continuation schools, usually held in the evening. There are also courses for adults given in the communes. The secondary schools are maintained by the cantons, and include professional and technical schools, with others variously styled middle schools, gymnasia, or pro-gymnasia. These are supplemented by cantonal universities and a Federal polytechnic. The teachers are licensed by cantonal governments on examination, or in some cantons on a diploma from a normal school. For the higher grades of work, an additional examination is required. There were in 1900 thirty-eight normal schools in Switzerland, most of them public institutions maintained by the cantons. In most cantons teachers are elected for life, either by a school board or at a general election. They are also usually pensioned at the end of their term of service. This is, in general, partly provided for by a fund to which they make regular contributions.

At the head of education in each canton there is either (1) an educational council, or, (2) an education ministry, headed by a director of education, who is a member of the Executive Council of the canton, or (3) a permanent education council, presided over by a director of education who is a political officer. The Canton of Bern belongs to the second type, and in the control of its schools it represents the extreme of centralization in Switzerland. The Director of Education controls the inspectors and frames the educational budget. His department determines, on consultation with certain authorities, the curriculum and methods of instruction in all public schools. Private schools must receive his authorization and that of the local school inspectors. The communal council votes the money for its primary schools, and nominates a school board to control the expenditure of this and the details of local school management. Several communes combine to form a secondary school, the control of which is in the hands of a commission, whose members are appointed by the various communal councils and the Director of Education. The middle or higher schools are usually cantonal schools, and are controlled by a commission appointed by the Educational Department. On the other hand, the Canton of Zurich has the least centralized of all the Swiss systems. Its central government is of the third type above mentioned. The Educational Council is composed of six men, four of whom are chosen by the Cantonal Council, and the other two by the whole body of teachers. It controls the organization of education in the canton. The commissions that direct the cantonal schools, i.e. the

gymnasium, middle schools, higher schools, technical institutes, and training colleges, are appointed by the Cantonal Council on nomination by the Educational Council and Director of Education. For local organization and control of education there are provinces, districts, and communes. Each province has a committee, elected partly by the teachers alone, partly by the rest of the voters. Its function is to visit the schools and supervise their general conduct. There is a district committee elected by the voters to control the secondary school of the district, and determine the amount to be raised from local taxation for its support. For the primary school also there is a district organization, including usually several communes, the voters of which have a general assembly to determine school measures. The communal primary school is controlled by its local board. In Zurich alone of all the Swiss cantons, there are no school inspectors. In these two cantons, Zurich and Bern, we have illustrated the extremes between which the systems of the other cantons fall.

In Switzerland, generally, the support of all universities and higher secondary schools is by cantonal funds, aided occasionally by the cities in which such schools may be situated. The district and communal schools are supported by local taxes with cantonal aid. There exist for such support permanent communal funds made up of fees and gifts, and in all Switzerland they amount to over 58,000,000 francs. Moreover, twelve cantons have a permanent cantonal fund for Volksschule purposes. This does not, however, by any means provide for the support of the schools. Of the total expenditure on primary education, it is estimated that the local authorities furnish about two-thirds, the rest coming from the cantons; but in Geneva, where the French ideas prevail, the canton furnishes 74 per cent. of such funds. In general, in the wealthier cantons the canton furnishes more and the commune less of the total raised. The cantonal grants are made either in proportion to the total expense of the commune, or to its poverty and need for aid, or, as is more commonly the case, according to both these principles. The cantonal money goes largely as a contribution for teachers' salaries, the school equipment being left mainly to the communes. The canton usually contributes a greater proportion of the amount necessary to support the district secondary schools than of that for the communal primary schools. In the raising of school funds the general legislative bodies of communes and cantons usually fix the total amounts, and the distribution of expenditures is left in the hands of the school authorities. In some cases, however, as in Zurich, the communal school board can levy the local school taxes. Of the amount for the support of schools generally, the primary, higher primary, district, and continuation schools get nearly three-fourths; higher secondary and technical education receives less. For the organization of Swiss universities, see UNIVERSITY.

OTHER EUROPEAN SYSTEMS.

The systems already described offer examples that are typical of the education in other European States. In Sweden, elementary and secondary schools are supported by State subsidies and local taxes. Many schools

and universities have in addition to such support the income from endowments. Control of schools is in the hands of local boards, but the central Government maintains a system of inspection and requires teachers to be graduates of normal schools. Public elementary education is gratuitous and compulsory between the ages of seven and fourteen. In Austria the ideals and methods of Prussian education prevail. The Italian system has the same general features of State subsidies and local and provincial taxes for the support of both elementary and secondary education. The minimum number of schools, the curricula, and the qualifications of teachers are also laid down by the State. Public elementary education is gratuitous and compulsory between the ages of six and nine. The State inspects all public schools, and private schools must receive authorization by the Government.

In Spain attempts have been made to establish a complete and efficient system of elementary education. The Government determines programmes and inspects schools, but furnishes little assistance to their support. The municipalities bear most of the burden and the compulsory law is not enforced. For most of the children education is free. In Russia about one third of the elementary education is carried on by the Church. Nearly all the rest is controlled and supported by the central Government acting under the Ministry of Public Instruction. The Church also takes part in secondary education, but here the Ministry bears most of the responsibility. There are a small number of locally supported schools and foundation schools.

UNITED STATES.

In the United States, the control and support of the education of the people have been left practically to the several State governments. The central Government has, however, dealt with the matter in a few cases. The Ordinance of 1787 provided that one section of each township in the Northwest Territory should be designated as school land, and that the proceeds of its sale should go to the support of public schools. After States were organized in this region, the funds derived from these lands were turned over to them for educational purposes. Similar grants of land were made to other new States, notably in 1841, in 1849, and in 1860. Up to 1900 about 86,000,000 acres had been devoted to this purpose. These grants were supplemented in 1836 by a gift to the several States of surplus funds in the National Treasury, the sums thus given being by most of them devoted to the support of education. In 1862 the Morrill Act set aside additional lands for the maintenance of colleges, in which agricultural and mechanical arts and military tactics were to be taught, and the State universities generally have been the recipients of these gifts. The central Government established, in 1867, the Bureau of Education, the main objects of which are the collection of statistics and the preparation of reports.

Each of the several States maintains a system of free public schools, including elementary, secondary or high schools, and, in the case of twenty-nine of them, universities as well. The older States, where great colleges and universities on private foundations have for a long time existed, have not in most cases added such institutions.

For the elementary schools three systems of control exist. The first of these is the district system, according to which the control of each school is left in the hands of a board elected by the people of the district in which it is placed. Under the township system all schools that are located within the region of a township are placed under one board. According to the county system, the schools of a whole county are under the control of county boards or school commissions. The district system was developed in New England after the scattering of the population, due to the cessation of the early Indian wars. It spread to the States of the West. Later, owing largely to the opposition of reformers, like Horace Mann, who maintained that the district system meant insufficient support and inept supervision for the common schools, New England came to adopt the township system. The county system has been peculiar to the Southern States from the first, and to-day it exists in nine States, all of which except Utah are Southern. The township system exists wholly or partially in eighteen States, and the district system in thirty-three.

With the development of more elaborate school systems, the supervision of the State became a more and more prominent feature. New York, in 1812, created a superintendent of common schools. This example was followed by others, and to-day there are State superintendents in all States. In most of them there is also a State board of education, which usually manages State school funds, and either directly or indirectly determines the qualifications of teachers. For more minute supervision, there is inspection either by a county superintendent or by the township or district committees. In thirty-five States the county supervision prevails. In New England the township school committees do the supervising. In addition, at least 835 cities have superintendents for their public schools. The demand for greater uniformity and effectiveness in the schools, as a whole, has led not only to the creation of larger units for the control or supervision of schools, but also to the establishment of State funds, and the levying of State taxes to supplement local contributions to the cause of education. The State taxes are relied on to raise as much as three-fourths of the school money in some States, and the amount is largest in the Southern States and those of the far West. The North Central and North Atlantic States generally rely more on local taxes, Massachusetts having no regular State tax. The local taxes are raised either in the township or, as in the far West and South, in the county. Where there is a county tax, this may usually be supplemented by a district tax levied by local vote. The levying of this tax is in the hands of the legislative bodies of State, county, or local division, although sometimes the educational bodies have the power of determining the amount to be raised. Frequently State law determines the minimum amount to be raised by local taxation.

In the earlier colonial period secondary instruction was given in what were called grammar schools. These institutions admitted children who had mastered merely the rudiments of English, and prepared them for college. The high schools were, however, preceded by academies. They were introduced into the United States as a substitute for both the grammar

schools and the colleges. Many of these academies received, in addition to private endowments, large grants from the States. Some of them grew into colleges and later into universities. Academies for girls were established, and thus the way was paved for the higher education of women. The academies offered a somewhat wider and more liberal course of study than the older grammar schools and colleges, which were concerned mainly with the classics. In this way they led to the more liberal high schools and to the extension of the college curriculum.

The high school sprang up in response to a demand felt in the early part of the nineteenth century for the secularization and State control of secondary education. The English Classical School, later called the English High School, was founded in Boston in 1821. To-day a free public high school has to be maintained in every township in Massachusetts. New York, Maryland, Wisconsin, Minnesota, California, and other States have elaborate State laws governing high schools. In a great number of States their creation and control is left to localities, the actions of which in the matter are not regulated by the State. They are found, however, in all important cities.

The free elementary school may be said to exist in every locality of the United States, however sparsely inhabited. In the Western and Southern States the remoter districts are greatly helped by the contributions from the State funds, which are distributed in such a manner as to favor especially the smaller schools. The high schools, on the other hand, the existence of which is left almost universally to local initiative, are dependent largely on local support. Outlying districts are, in consequence, frequently without them, and when they exist there, the territory that they supply includes ordinarily a number of elementary school districts. Such divisions are either townships, as in New England, or counties, as in Maryland, the South, and occasionally in the West, or simply a convenient grouping of districts into what is called a union high school district. The board governing such schools is usually a specially created one, except where the township or county system prevails. In these cases, as with the district high school, the elementary and secondary schools are both managed by the same board.

The teachers in elementary schools, up to the time of the establishment of county and State supervision, were selected by the school boards at their discretion. To-day, licenses or certificates are universally required before one can be elected to a teacher's position. In New England, however, these are granted by the school committees of the township, and so teachers are licensed by the same board by which they are elected to office. Elsewhere, throughout the Union, the certification is in the hands of city or county superintendents or boards of education, or State superintendents or boards of education. Certificates of various grades are issued in the several States. High school certificates are universally distinct from those for elementary teaching. All are granted either upon examination or upon credentials. Local certificates are valid only in the specific division where they are granted, but are frequently accepted as adequate credentials in other localities. State certificates are for longer periods, or even for

life, while the local certificates expire after a few years.

The qualifications required of teachers in both elementary and secondary schools are being made continually higher, and this is true not only in regard to scholarship, but also to professional training. Three State normal schools were established in Massachusetts under the influence of Horace Mann in 1839-40. Since then these institutions have spread all over the Union. In addition, teachers' institutes and university summer schools and extension courses furnish professional training, while the leading colleges and universities have departments of education. In general, the tendency is for a continually greater proportion of elementary teachers to have at least a normal school training, and for high school teachers to be college graduates, who have done special work in the educational departments. Indeed, movements are on foot in several States, as California, to abolish the system of certification or examination altogether, and to grant certificates only to those who are graduates of normal schools or of colleges having professional courses.

The ideal course of study in the modern primary school in the United States, as outlined by the 'Committee of Fifteen' in 1894, includes reading, writing, spelling, composition, arithmetic, geography, simple lessons in natural science and general history, vocal music, drawing, with physical culture, and manual training. In many schools such a programme exists, and in most an effort is made to approximate it. The greatest difficulty arises in the ungraded country schools, where a single teacher is called upon to teach children from five to eighteen years of age, and representing, of course, all or most of the grades of the elementary school. The ideal grammar school course, as outlined by the same committee, in addition to the subjects of the primary grades, consists of English grammar, algebra, and United States history in the last two years, and either Latin, French, or German in the last year. Only in a few cases, however, are the foreign languages actually to be found in the grammar grades of the elementary school.

The course of study in the high schools is usually arranged with a view to presenting to the pupil from one to four different groups of subjects, any one of which he is at liberty to choose. The first of these groups constitutes the old classical course, but includes, besides Greek and Latin, modern languages or English, or both, algebra, geometry, and some history and natural science. What is commonly called the literary course drops the Greek and substitutes therefor more English, modern languages, or history. The scientific course drops Greek and sometimes Latin, laying stress on the sciences and mathematics instead. In some cases the classical languages are abandoned for the sake of English, history, civics, political economy, etc. Another course, which emphasizes preparation for business, and gives instruction in book-keeping, stenography, typewriting, commercial arithmetic, and law and business methods, is frequently found. The tendency is, however, to hand over such a course to a commercial high school or business college. It is a favorite line of work for evening high schools. Practically, all courses embrace algebra, geometry, civics, English, United States history, and physics. The sciences taught

in the scientific course include chemistry and often botany and zoölogy. Courses in solid geometry, higher algebra, and trigonometry are often offered in high schools.

Besides the ordinary and the commercial high schools, there have grown up numerous schools of the high school grade, offering instruction in mechanical and industrial lines, and extensive practice in manual training. They represent a demand that existed at the time of the establishment of the high schools, and is to-day extensive and growing. It is that secondary education should be an immediate preparation for life instead of merely for college. The 'accrediting' system, which prevails in Michigan and California, and by which high schools desiring to pass students without examination into the colleges are inspected by the faculties of the State universities, has been criticised for tending to reduce the high schools to mere 'feeders' for the universities. On the other hand, it must be said that the colleges have very extensively modified and enlarged the curriculum of the old days of purely classical instruction, so that each of the courses offered in high schools, except perhaps the commercial one, prepares for some line of collegiate work. Moreover, the 'accrediting' system has been the only system of effective inspection to which the high schools have been subjected, if we do not regard the college entrance examinations as attaining this end. The method of judging school work by the examination of pupils is, however, sometimes used even in elementary schools, where examinations for promotion or graduation are given by county authorities for all the schools of the county.

No effective system of pensioning teachers exists in the United States, although some laws have been passed aiming at this. They have relied on the contributions of teachers, who may join in or not as they choose, and consequently they have never amounted to anything of importance. On the other hand, the salaries of teachers in the elementary schools compare favorably with those abroad, averaging \$58.59 a month for men and \$50.92 for women in the West, where they are highest, and \$35.99 per month for men and \$31.43 for women in the South, where they are lowest.

Thirty of the States have compulsory education laws. The common period during which some instruction must be given is from the eighth to the fourteenth year. These laws, though not rigidly enforced, are nevertheless fairly effective, and attendance for at least part of the year is nearly universal for children of school age.

The evolution and present status of higher education in the United States, the most notable features of which have been the development of the State universities and the transformation of the colleges into universities, are dealt with in the article on **UNIVERSITY**. For a treatment of the American elementary schools, see the article on **COMMON SCHOOLS**.

NATIONAL GALLERY. An important picture gallery in London, situated on the north side of Trafalgar Square. It was erected from designs by Wilkins between 1832 and 1838, and originally cost £96,000. It was enlarged in 1860, 1876, and 1886. The gallery, formed in 1824, was rapidly increased and has received important collections of paintings, presented or bequeathed by Vernon in 1847, Turner in 1856, and Ellis in 1876. The Peel collection was purchased in 1871. It has a valuable series of the older Italian artists, and contains the most costly single painting in the world, Raphael's "Madonna degli Ansidi," purchased from the Duke of Marlborough in 1884 for £70,000.

NATIONAL GUARD (Fr. *Garde Nationale*). From 1789 to 1871 the name of the French militia under municipal control, recruited from the burgher class. The French Revolution really brought about the creation of the National Guard, though guards of a like nature had existed in some towns previous to 1789. In that year, however, they were instituted in Paris, on the suggestion of Mirabeau, by the Revolutionary Committee, as a check on the Royalists. The National Guard thus constituted numbered 48,000 men, and Lafayette received the command. Other battalions were organized in the provinces, and very soon, on paper, the total strength of the National Guard of France was 4,000,000—though the actual available force was not more than 300,000. In 1795, after the National Guard had gone through many of the most eventful scenes of the Revolution, it was reorganized on a less democratic basis. The result was that it showed Royalist leanings. It rose against the Convention shortly before the dissolution of that body, but

the movement was promptly suppressed by Bonaparte with grape-shot. This was the insurrection of the 13th Vendémiaire (October 5th). For a time the National Guard ceased practically to exist. In 1805, however, the Emperor Napoleon reorganized it and it rendered him good and efficient service, particularly in the disastrous years 1813-14. After 1815 the National Guard was still maintained, but in 1827 it was dissolved by Charles X. Its members were allowed, however, to retain their arms, and many of them participated in the July Revolution of 1830, at which time the National Guard, as an institution, was revived. During the reign of Louis Philippe it was prominent. In 1848 it helped do away with the monarchy and establish the Republic. After undergoing various reorganizations in 1848, 1852, and 1855 it again became firmly established. The National Guard fought in the Franco-Prussian War in 1870, and at the capitulation of Paris its members were allowed to retain their arms. The result was that during the Commune of 1871 numbers of National Guardsmen went over to the Communists. (See COMMUNE.) After the establishment of the third French Republic the National Guard was abolished—its place being taken by the system of universal military conscription. Consult: Poisson, *L'armée et la garde nationale* (Paris, 1858-62); Thoumas, *Les anciennes armées françaises des origines à 1870* (Paris, 1890). For the National Guard of the United States, see MILITIA.

NATIONAL HYMNS. It is only within comparatively modern times that patriotism has found expression through the medium of a national song. In the few cases where a national hymn dates back several hundred years, it will be found to have assumed its representative character recently. National music is inseparably connected with folk-music (q.v.), but is a later development, and instead of representing the work of individuals (influenced by similar conditions and surroundings) it embodies the feelings, tendencies, and ideas of a people. In other words, folk-music is individual in its character rather than national. Needless to say, however, it is the forerunner and basis of national music, which often reaches its culmination in the national hymn. The following list of national hymns covers the most important ones. It is compiled largely from Sousa's *Airs of All Lands* (Philadelphia, 1890):

Argentine Republic—"Oid, mortales, el grito sagrado" (1810) (Hear, oh Mortals, the Sacred Call). Music by D. V. Lopez.

Austria—"Gott erhalte Franz den Kaiser" (1797). Words by L. L. Haschka; music by J. Haydn.

Belgium—"La Brabançonne" (national air); by F. Campenhout.

Bohemia—"War-song of the Hussites."

Brazil—"Hymno da Proclamação da Republica" (1889) (Hymn of the Proclamation of the Republic). Words by Medeiros e Albuquerque; music by Leopoldo Miguez.

Burma—"Kayah Than" (Sound the Trumpet).

Chile—"Dulce Patria" (national air); by Carnicer.

Costa Rica—"De la Patria." Music by M. M. Gutierrez.

Denmark—"King Kristian stod ved højen

mast" (King Christian stood beside the mast). Words by Ewald; music by Hartman.

Ecuador—"Salve, Oh Patria."

Egypt—"Salaam, Effendina" (March of the Khedive).

Finland—"Vårt land" (Our Land). Words by J. L. Runeberg; music by F. Pacius.

France—"La Marseillaise" (q.v.). Words and music by Rouget de Lisle.

Germany—"Heil dir im Siegerkranz." Words by H. Harries to music of "God Save the King" (q.v.).

Great Britain—"God Save the King" (q.v.).

Holland—"Wien Neerlande."

Hungary—"Isten áld meg a Magyar" (Lord Bless the Hungarian).

Italy—"Royal March" (national air); by G. Gabetti.

Japan—"Keemê gajo" (May the Empire Last).

Mexico—"Mexicanos, al grito de guerra" (national air) (Mexicans, at the cry of war); by J. Nunó.

Nicaragua—National air, by Blas Villatas.

Persia—"Salamat Shah." Music by A. Le-maire.

Peru—"Somos libres, seamoslo siempre" (We are free, let us be so ever).

Rumania—"Traiasca Regale" (Long Live the King) (1862). Words by V. Alexandri; music by E. A. Hübsh.

Russia—"Boghe Zaria chraný" (God Protect the Czar) (1830). Words by Zhukovsky; music by A. Lyoff.

Salvador—"Saludemos la Patria" (Let us Hail our Country). Words by J. J. Canas; music by J. Aberle.

Servia—"God in His Goodness." Music by D. Jenko.

Spain—"Himno de Riego." Music by Herta.

Sweden—"Ur svenska hjertans" (Out of the Swedish Heart).

Switzerland—"Rufst du, mein Vaterland," to music of "God Save the King."

United States—"Star Spangled Banner." "Hail Columbia," and "America" (qq.v.). (The first is played in the United States Navy at morning colors; the latter at evening colors.)

Uruguay—"Himno Nacional de la República Oriental del Uruguay" (National Hymn of the Republic of Uruguay). Music by D. I. Deballi.

Venezuela—"Gloria al bravo pueblo" (1811) (Honor to a Brave Nation). Words by V. Salias; music by J. Sandaeta.

Consult: Engel, *An Introduction to the Study of National Music* (London, 1866); Fitzgerald, *Stories of Famous Songs* (ib., 1898).

NATIONALISM. A term applied to the plan of social reform outlined in Bellamy's *Looking Backward*. The scheme involved the nationalization of the processes of production and distribution. It is a form of socialism which emphasizes the social importance of economic equality.

The first Nationalistic Association was organized by a company of Bellamy's readers in Boston in 1889. A statement of its views condemned the system of competition and expressed the belief that it would gradually be supplanted by a system of universal brotherhood. The movement spread rapidly and by 1891 there were in the United States 162 clubs. In some States,

notably California, an active part was taken in politics. In May, 1889, a magazine, the *Nationalist*, was started which existed two years. Its place was then taken by the *New Nation*, founded by Bellamy, which also lasted two years. The Nationalists exercised a considerable influence upon the People's Party, but ceased to play any considerable independent rôle. The movement spread to England, where 'The Nationalization Society' was organized July 3, 1890. See **SOCIALISM**.

Consult: Bellamy, *Looking Backward* (Boston, 1887); and id., "The Programme of the Nationalists," article in the *Forum* (March, 1894); Ely, *Socialism and Social Reform* (New York, 1894).

NATIONAL MUSEUM. See UNITED STATES NATIONAL MUSEUM.

NATIONAL NICKNAMES (ME. *nekename*, *ekename*, by faulty liaison or sandhi for an *ekenname*, additional name, from *eke* + *name*). National nicknames are as a rule first employed by the people themselves. By the familiar JOHN BULL is meant the English nation. The name was first used in the satire of Dr. John Arbuthnot, *Law is a Bottomless Pit*. The sobriquet of JONATHAN or BROTHER JONATHAN has gone through three distinct phases. First, between 1776 and 1783 it was employed, as a mildly derisive term, by the Loyalists, and applied by them to the Patriots; secondly, between 1783 and 1812 it was adopted by the Americans themselves, who used it to designate a country bumpkin; and thirdly, during the war with England in 1812-15 it came into universal vogue as a national sobriquet. The accepted story, attributing the origin of the term to a remark made by Washington in allusion to Governor Jonathan Trumbull of Connecticut, originated in 1846, and has recently been shown to be without foundation. UNCLE SAM, the familiar sobriquet of the United States government or people, is commonly stated to have originated at the outbreak of the war with England in 1812, when some one, asking what the letters 'U.S.' marked on casks and barrels meant, was facetiously told that they referred to "Uncle Sam" or Samuel Wilson, an obscure citizen of Troy, N. Y., said to have been an inspector or a contractor. This story has not been found earlier than 1842, when it was given in J. Frost's *Book of the Navy*, p. 297. No doubt Frost copied it from some newspaper, but the story lacks proof. The term Uncle Sam has yet to be traced earlier than the fall of 1813, when we read of "Uncle Sam's Men," meaning United States custom house officers, and are told that "Uncle Sam, the now popular explication of the U. S., does not pay well." The term appears to have arisen somewhere in the North, perhaps in New York or Vermont; and its origin was presumably merely a jocular extension of the abbreviation U. S., then very common. For three years it ran a career in the newspapers, in 1816 it appeared in a book, and by 1817 its popularity was well established. NICHOLAS FROG, the typical Dutchman, was first used by Arbuthnot in his *Law is a Bottomless Pit*. JEAN CRAPAUD (Toad) is the popular nickname of the French nation, collectively taken, and dates back to the time when the ancient kings of France used for their device in heraldry 'three toads, erect, saltant,' or in a leaping

posture, and Paris was called Lutetia, or 'Mud-land.' Its streets were so quaggy that the French Court, with a point to its pleasantry, called its inhabitants 'frogs,' since they, like the reptiles, lived in mud. For the French-Canadian we have JEAN BAPTISTE, and the French peasant is facetiously called JACQUES BONHOMME. DEUTSCHER MICHEL is the facetious nickname applied to the German people, and intended particularly to satirize the weaknesses and foibles of the national character, especially their proverbial lethargy, heaviness, and credulity. The name Michael is used in German to designate any simple, uncultured countryman, and it has probably gained this significance by confusion of the Hebrew word with the old German michel-gross. SAWNEY is the sportive designation sometimes applied by the English to the Scotch, and is probably a corruption of Sandy, the abbreviation of Alexander. Sawney has a humor of his own, strong, and irrepressible, that will break out in spite of worldly thrift, kirk-session, cutty-stool, and lectures. It was first given to the Scotch by Coleridge. TAFFY, the Welshman, is a corruption of David, one of the most common of Welsh names. COLIN TAMRON is the reproachful, contemptuous nickname given to the Swiss in ancient times, and supposed to imitate the sound of their guns. PADDY, from Patrick, refers to the Irish. JOHN CHINAMAN is the popular nickname for the Chinese. The first record of this use was in *A Letter to the Committee of Management of Drury Lane Theatre, London, in 1819*. The Russian nickname, IVAN IVANOVITCH, denotes the typical muzhik.

NATIONAL REPUBLICAN PARTY. See WHIG PARTY.

NATIONAL STANDARDS AND EMBLEMS. See STANDARD and *National Coats of Arms* (with Plates), under HERALDRY.

NATIONAL UNION. A fraternal beneficial society organized for purposes of mutual help and improvement, and incorporated in 1881 under the laws of Ohio. The number of members at the close of 1902 was 60,000; the number of councils 850. The insurance in force amounted to \$140,000,000, and the death benefits paid since the date of organization to over \$15,000,000.

NATIONAL WORKSHOPS, or ATELIERS NATIONAUX, à'te-lyá ná'syó'nó'. A plan of giving public employment attempted in France in 1848. The Provisional Government organized on the overthrow of Louis Philippe by the February Revolution passed a decree (February 25th) defended by its socialist members—Louis Blanc, and a few others—declaring the 'right to work' and pledging the Government to guarantee employment for idle workmen. A few days later 'national workshops' were established. As a matter of fact there were no workshops opened; the work provided was in the open air, and consisted largely in planting trees, digging, and constructing roads—works for which few of the applicants were adapted. Their number, however, increased from day to day and at one time reached 130,000. No work could be found for many of the applicants; these received 30 cents a day, while those actually employed were paid 40 cents, although the work they performed was scarcely worth the additional 10 cents. Under these circumstances many workers who were in private employ demanded higher wages or were content to give up their places

and remain idle so long as they might receive 30 cents per day for doing nothing. Several attempts were made to bring the scheme within the range of practical feasibility; but political disturbances and personal jealousies made it impossible to carry them out. After four months' trial and a total expenditure of 14,000,000 francs, the system was abandoned when General Cavaignac became Chief of the Executive.

The national workshops are sometimes erroneously confounded with the *ateliers sociaux* in Louis Blanc's plan of labor organization.

NATIVE (from Lat. *nativus*, natal, inborn, from *nasci*, to be born; connected with Gk. *γενεσθαι*, *gignesthai*, Skt. *jan*, AS. *cennan*, archaic Eng. *ken*, to beget). A term applied in chemistry and mineralogy to elements, especially the metals, when found in nature in a chemically free state.

NATIVE BEAR. The Australian koala (q.v.).

NATIVE COMPANION. An Australian Balearic crane (q.v.).

NATIVITY (Lat. *nativitas*, birth, from *nativus*, natal, inborn), THE. A frequent theme of painters. The most celebrated representation of the subject is the famous picture by Correggio known as "La Notte" (the night); in the Dresden gallery. The whole picture is illuminated by the light proceeding from the body of the beautiful child. Above is a group of angels, while day is just breaking in the sky.

NATORP, nã'tõrp, PAUL GERHARD (1854—). A German philosopher of the Neo-Kantian type. He was born at Düsseldorf; studied in Berlin, Bonn, and Strassburg; and in 1885 became professor at Marburg. His works include: *Descartes's Erkenntnisstheorie* (1882); an edition of Democritus's *Ethica* (1893); *Religion innerhalb der Grenzen der Humanität* (1894); *Platos Staat* (1895); *Sozialpädagogik* (1898); and *Platos Ideenlehre* (1903).

NATROLITE (from Eng. *natron*, from Ar. *natrûn*, *nitrûn*, native carbonate of soda, from Gk. *νίτρον*, *nitrôn*, *λίτρον*, *litron*, natron, of Semitic origin (cf. Heb. *neter*, from *natar*, to loose) + Gk. *λίθος*, *lithos*, stone). A mineral sodium-aluminum silicate of the zeolite group. It crystallizes in the orthorhombic system, has a vitreous, sometimes pearly, lustre, is transparent or translucent, and ranges in color from white or colorless to gray, yellow, and red. Natrolite is found in cavities in basalt and other igneous rocks, at various localities in Bohemia, the Tyrol, Ireland, and Scotland, in Nova Scotia, in the Lake Superior region, and at Bergen Hill, N. J. It is capable of receiving a high polish, and has been used as a gem for rings and other ornaments, especially in the form of the letter N in initial jewelry.

NATRON. A hydrous sodium carbonate that crystallizes in the monoclinic system, and is found in nature only in solution, as in the Soda Lakes of Egypt. Of similar character is the *Troma*, an impure hydrogen sodium carbonate, which occurs as thin crusts along the margin of lakes in Egypt, Siberia, Tibet, and on the borders of the Black and Caspian seas. These minerals form the source of the soda salts of the ancient Egyptians, and were used by them in their

arts, especially in embalming. Of like character is the carbonate of soda found at the bottom of the lake at Lagunillas near Mérida, Venezuela, which is called by the Indians *Urao*. Similar efflorescences are found in San Bernardino and Inyo counties, California, where they are formed by the spontaneous evaporation of saline waters.

NATTEB, ná'ttér, HEINRICH (1846-92). An Austrian sculptor, born at Graun, Tyrol. He studied at the Polytechnicum in Augsburg and at the Academy in Munich. He lived in Munich and afterwards in Vienna. Besides many portrait busts of celebrities, he produced a number of memorial statues and groups, notably the "Zwingli Monument" (1885) at Zurich; the "Haydn Monument" (1887) in Vienna; "Walther von der Vogelweide" (1889) at Bozen; and the heroic statue of "Andreas Hofer" (1892) on Mount Isel, near Innsbruck, his principal work.

NATTERJACK (from AS. *nædre*, Goth. *nadró*, Ger. *Natter*, adder + *jack*). A common, light-colored, rather smooth toad (*Bufo calamita*), of Western Europe, found in sandy districts. Its active habits have given it the name 'running toad' in some parts of England.

NATTIER, ná'tyá', JEAN MARC (1685-1766). A French portrait painter, born in Paris. He was the son of the painter J. B. Nattier, and a pupil of Jean Jouvenet. He won the Academy prize in 1700, became a member of that body in 1718, and professor in 1752. He went to Amsterdam in 1715 and there painted portraits of Peter the Great, of his wife, Catharine I., and of members of their suite. If Rigaud is the painter par excellence of the men of his time, Nattier has done as much for the women. There are many portraits by him at Versailles, such as those of Maria Leszczyńska, Madame Henriette de France (1751-54), Madame Adelaide, Madame Victoire, and Louise Henriette de Bourbon. Madame de Châteauroux as "Dawn," and Madame de Flavacourt as "Silence," are two of his best known works. "Magdalen in a Grotto" is his only work in the Louvre.

NAT TURNER'S INSURRECTION. See TURNER, NAT.

NATUNA (ná-tōō'ná) ISLANDS. A group of islands in the South China Sea, northwest of Borneo, belonging to Holland (Map: Australasia, C 2). They are for the most part densely wooded and mountainous, but have some cultivated tracts which produce maize, rice, sago, and cocoanuts. The area is estimated at 803 square miles, and the inhabitants, who are chiefly Malay fishermen, number about 8000.

NATURAL (from Lat. *naturalis*, according to nature, from *natura*, nature, from *nasci*, to be born; connected with Gk. *γενεσθαι*, *gignesthai*, to become, Skt. *jan*, to beget, AS. *cennan*, obsolete Eng. *ken*, to beget). In music, the sign ♮, which, placed before a note, counteracts the effect of a previous ♯ or ♭ and restores the note to its normal or natural place. To counteract a double sharp or a double flat (×, bb) a single natural is used, although it was formerly customary to write a double natural (♮♮). This form is superfluous and incorrect. In a key with many sharps or flats a doubly raised or lowered interval is generally restored to the chromatically altered tone required by the key signature. Thus, in G flat a bb would be restored, not to b, but to

bb, which is indicated by ♮b. Likewise in a signature with sharps the natural sign appears as ♮♯.

NATURAL BRIDGE. One of the chief natural curiosities in the United States. It is situated in Rockbridge County, Va., 115 miles west of Richmond (Map: Virginia, E 4). The bridge spans a deep chasm, through which a small stream flows. It is composed of a hard siliceous limestone in horizontal strata, and is the remnant of the roof of a great cave which formerly covered the gorge. This remnant now remains in the form of an arch 215 feet high. The span of the arch is from 45 to 60 feet, and the thickness of its crown is about 40 feet, while its average width is 60 feet. A public road passes across it.

NATURAL GAS. See GAS, NATURAL.

NATURAL HARMONICS. See HARMONICS.

NATURAL HISTORY. A term used at different times and by different authors in a variety of senses. It was applied at first to the study of all natural objects, including minerals, rocks, and all living beings. The study of external nature, and of the phenomena or laws governing the movements of natural bodies, was formerly opposed to metaphysics, history, literature, etc. After a while astronomy and chemistry were eliminated from natural history; then natural philosophy, or what is now called physics, was separated from chemistry. But natural science, as distinguished from physical science, has made such progress that we must now know whether our naturalist is a mineralogist, a geologist, a paleontologist, a botanist, a zoölogist, or a specialist in some narrower department of biological study. At present natural history is confined to the study of organic nature, or biology, and students of general physiology and morphology are called biologists. See BIOLOGY; BIONOMICS.

NATURAL HISTORY OF SELBORNE. A work by Rev. Gilbert White (1789). It was produced from letters written by the author to Thomas Pennant and to Daines Barrington on outdoor life in a Hampshire village. Written in a style simple and entirely free from self-consciousness, it shows wonderful observation of nature, with a charm that made it an English classic.

NATURALISM. The name given in philosophy to any system which seeks to explain the order of the universe by efficient causation alone, without calling in the aid of conscious purpose. (See CAUSALITY.) The most prevalent forms of naturalism have been mechanistic, i.e. have attempted to reduce efficient causation to mechanical causation. For instance, the systems of Democritus, Epicurus, and Lucretius attempted to account for the universe as we know it by the fall of atoms. A more elaborate form of the same attempt is to be found in modern materialism (q.v.). But naturalism need not be merely mechanistic. It may recognize the fact that psychic phenomena have laws of their own which cannot be deduced from the laws of motion; for the recognition of unique psychological laws may very well go with a refusal to regard the whole course of nature, physical and psychical, as in any way controlled by an overruling purpose. Many so-called materialists, e.g. Feuerbach,

THE NATURAL BRIDGE

Copyright, 1900, by the Detroit Photographic Co.

are not materialists at all, but naturalists in this sense of the term. Opposed to the naturalists are the teleologists. See TELEOLOGY; LOTZE; and consult: Ward, *Naturalism and Agnosticism* (London, 1899); König, *Die Entwicklung des Causalproblems* (Leipzig, 1888-90); Sigwart, "Der Kampf gegen Zweck," in *Kleine Schriften* (2d ed., Freiburg, 1889); Erhardt, *Mechanismus und Teleologie* (Leipzig, 1890).

NATURALISM (in Literature). See REALISM AND NATURALISM.

NATURALISTS, AMERICAN SOCIETY OF. An association organized in 1883, to exchange ideas relating to the problems of natural history. The society now has an active membership of 230. The meetings of the society are held annually.

NATURALIZATION. The act or process by which in any country an alien acquires citizenship. The process consists of two parts, viz. the formal renunciation of the old allegiance and the assumption of a new allegiance. The rights and privileges of naturalized citizens are enumerated and defined by the municipal law of every State. In few or no cases are they the same as those of native-born citizens. In the United States they enjoy the same civil rights as natural-born citizens, and all of the political rights except eligibility to the offices of President and Vice-President. The right of a subject or citizen to renounce his allegiance with a view to acquiring citizenship in another State is now generally recognized. (See EXPATRIATION.) In order to prevent possible conflicts of jurisdiction growing out of the practice of naturalization and the return of naturalized citizens to their native country, it is customary for States to enter into treaties for the regulation of matters relating thereto. Thus, the United States has entered into eleven treaties with foreign powers, in all of which, except that with Great Britain, it is provided that five years of uninterrupted residence with formal naturalization constitutes citizenship on both sides. A majority of them contain the provision that a naturalized citizen returning to his native State shall, after an uninterrupted residence there of two years, be presumed to have renounced his acquired citizenship. It is also a general principle that naturalization does not release an individual from any obligations to his native State which he may have incurred before emigration, as, for example, military service; and if he returns to such State he may be held to the fulfillment of his obligations without being able to invoke the protection of the United States, unless treaty stipulations provide otherwise.

In the United States, the whole matter of naturalization is subject to the regulation of Congress. This power is held to be exclusive, and cannot, therefore, be exercised by the States. However, it is not construed to deprive the State of the right to restrict the civil and political rights of aliens, nor does it prohibit them from granting the suffrage to aliens, or allowing them to hold office. The statutes of Congress provide that any alien, with certain exceptions, may become a naturalized citizen of the United States by making a declaration on oath, before a circuit or district court of the United States, or a district or supreme court of the Territories, or a court of record of any of the States having common-law jurisdiction, at least two years prior

to his admission, that it is his *bona fide* intention to become a citizen of the United States, and to renounce at the same time all allegiance to any foreign State, as well as all hereditary titles of nobility which he may hold. This step is known as the declaration of intention, and after it is made the declarant is perhaps morally entitled to a qualified amount of protection from the United States, although it cannot be claimed as an absolute right. (See KOSZTA AFFAIR.) The full admission to citizenship follows after due proof has been furnished that the declarant has resided in the United States at least five years next preceding his admission, and within the State or Territory where the court sits for one year. By the act of 1790 the term of residence required was two years; in 1795 it was extended to five years; and in 1798 it was raised to fourteen years. Since 1802, however, the term has remained at five years. A minor alien who has resided in the United States for a period of three years next preceding his arrival at the age of twenty-one, and who has continued to reside there up to the time of his application, may be admitted to citizenship without the previous declaration, provided he has resided in the United States for a period of five years. Any alien seaman who has served three years on a merchant vessel of the United States subsequent to the date of his declaration may become a citizen by the production of a certificate of discharge and good conduct. The widow and children of an alien who has declared his intention of becoming a citizen, but dies before completing the final steps of naturalization, are considered as citizens upon taking the oath prescribed by law. An alien woman who marries a citizen of the United States, and who herself might be lawfully naturalized, is considered a citizen. Children born outside of the limits of the United States, but of parents who are citizens, are considered as citizens; but the rights of citizenship in such cases do not descend to children whose parents never resided in the United States. Since 1870 the privilege of naturalization has been extended to aliens of African nativity and of African descent. Chinese aliens are excluded by statute of Congress from the privilege of naturalization.

In Great Britain formerly the naturalization of an individual could be effected only by special act of Parliament. It was not until 1844 that a general naturalization law was enacted. This was followed by the comprehensive act of 1870, which with a few changes is the law now in force. By this act it is provided that an alien who has resided within the United Kingdom for a period of five years, and who intends to continue his residence therein, may apply to one of the principal secretaries of State for a certificate of naturalization, presenting such evidence as to residence and character as may be required. It is wholly within the discretion of the secretary as to whether the certificate shall be granted. A naturalized citizen in Great Britain is entitled to all the civil and political rights and privileges, and subject to all the obligations of natural-born citizens, except that when in his native State he shall not be deemed a British citizen unless he has complied with all the laws of that State regarding expatriation. (New York, 1899); *Revised Statutes of the United States*, title "Naturalization;" and Moore, *Digest of International Law* (Washington, 1903). See ALIEN; ALLEGIANCE; CITIZEN.

NATURALIZATION. In biology, the establishment of plants and animals in a new region, especially through the agency of man. Primarily, exotic species soon become feral and compete with indigenous species. They frequently never gain a foothold, but if they do they usually spread at first with extraordinary vigor, owing to the absence of their natural enemies. But later an adjustment with the other species in the country occurs, and after that the disproportionate numbers of the introduced form disappear, i.e. the new species becomes adjusted or 'naturalized.' Compare ACCLIMATIZATION.

NATURAL LAW. GREEK PHILOSOPHY. Some of the Greek Sophists, and later the Epicureans, held that law and justice were arbitrary conventions established by the weak for self-defense against the natural right of the strong. Socrates, in this as in other matters, antagonized the theories of the Sophists; but it was Aristotle who formulated the conception of natural justice which has remained dominant to the present day. In his view justice is in part legal, in part natural. Legal justice deals with matters which must be regulated, but which may be variously regulated. Natural justice, on the other hand, is not arbitrary; its rules are everywhere similar. The Stoics went further: they asserted that the rules of natural justice were founded on reason, and were therefore discernible by reason; and the later Stoics termed this rational order *natural law*.

ROMAN JURISPRUDENCE. The Roman lawyers noted the fact that many substantially identical rules were observed by all the Mediterranean nations; and to this common law they gave the name 'law of nations' (*jus gentium*). In the first century before Christ they began to speak of 'natural law.' In the Roman juristic literature the term is used in four different senses: (1) Natural law is identified with universal law (*jus gentium*). This is practically the Aristotelian sense. (2) Natural law is contrasted with the law observed by all nations; e.g. it is said that by nature all men are free, and that slavery has been introduced by the law of nations. This is the Stoic conception of natural law. (3) Sporadically, the Epicurean idea appears, as when it is said that buyers and sellers have a natural right to overreach one another as regards price. (4) Ulpian has a theory which seems to have been peculiarly his own, but to which Justinian gave a factitious importance by including in his Institutes Ulpian's definition: "Natural law is that which nature has taught all living things." The illustrations, which refer to rudimentary family life, are biological rather than legal. Although the Roman jurists referred to the law of nature for the interpretation of their own law, and even drew from it supplementary rules where their own law was silent, they referred far more frequently, and for the same purposes, to 'natural reason' and to 'equity;' and they never ascribed to the law of nature such authority as to question the validity of a Roman rule because it was not in accordance with natural law. See CIVIL LAW; *JUS GENTIUM*; *JUS NATURÆ*.

MEDIEVAL THEORIES. The doctrines of Aristotle and of the Roman jurisprudence were generally accepted in the Middle Ages as authoritative, and many attempts were made to reconcile them. There was a marked tendency to identify natural law with the law of God: in the Decretum of Gratian it is declared that natural law is identical with the Golden Rule. Thomas Aquinas divided all law into four classes: eternal, divine, natural, and human. The eternal law is the controlling plan of the universe, existing in the mind of God. A part of this eternal law has been directly revealed to men; this is the divine law. Another part is discerned by human reason; this is natural law. Except in its fundamental principles, natural law is not immutable, for "it seems to be natural to the human reason that it comes gradually from the imperfect to the perfect." Human law is the application of natural law to particular conditions. The practical influence of these theories upon the development of European law during the Middle Ages was slight. In the development of the English common law, as in the development of the Roman Imperial law, appeals to natural reason were far more frequent than appeals to natural law. In England, however, as well as on the Continent, the general law merchant, which was *jus gentium* in the Roman sense, was recognized as natural law.

MODERN THEORIES. NATURAL LAW AS A FACTOR IN LEGAL REFORMS. The general effect of the Protestant Reformation was to free the conception of natural law from ecclesiastical associations and limitations, and to reemphasize its rational character. Natural-law theories became effective factors in the reform of the law. In the seventeenth century natural law was treated as a source of international law; and many rules which had not yet become rules of international custom attained this position through the writings of Grotius, Pufendorf, and others on 'the law of nature and of nations.' Later, during the eighteenth century and the earlier years of the nineteenth, when the great national codes of civil and criminal law were drawn up in Prussia, Austria, France, and other countries, natural-law theories helped to give the legislators a more independent attitude toward established law and custom. In England utilitarianism played a similar part in facilitating law reform.

NATURAL RIGHTS AS THE BASIS OF POLITICAL REVOLUTION. The theory of Cicero and of Thomas Aquinas, that laws in conflict with natural law are not truly laws, developed its revolutionary (not to say anarchistic) possibilities when the interpretation of natural law passed from secular and ecclesiastical authorities to the people at large. The theory that the popular consciousness is the true interpreter of that natural law by which all rulers are bound, found frequent expression before the close of the Middle Ages; e.g. in the writings of Marsiglio of Padua. With the Protestant Reformation these theories became practical forces in matters religious and political, and the tendencies which they represented first obtained a temporary triumph in England under the Commonwealth. Those legal rights which Englishmen had succeeded, through centuries of conflict, in asserting against the Crown were brought by the Levelers into connection with the natural-law theories of the Continent, and thenceforth the rights of the individual to life,

liberty, and property were 'natural' rights. To these were soon added the right to participate in the constitution of government. As formulated by Locke and reformulated by Rousseau, these natural-right theories legitimized the revolutions which established the modern constitutional State.

REACTION AGAINST NATURAL-LAW THEORIES. The first noteworthy philosophical reaction against the revolutionary natural-law theories was that of Hobbes (q.v.). Equally hostile to natural-law theories was, especially at the outset, the historical school of jurisprudence. The conception of law as a product of historical evolution in each nation led to the assertion that there could be no such thing as eternal or universal law. With the development of comparative study, however, it is again perceived that beneath all the diversity of national laws there is a substantially uniform element which may be called human or universal or natural. This natural law, however, is substantially the *jus gentium* of the Romans or the 'natural justice' of Aristotle, and not the natural law of the Stoics or of the Middle Ages; for it is not discerned by reason, it is rather revealed by the conduct of the human race. See JURISPRUDENCE and LAW.

Thomæ Aquinatis* (Freiburg, 1900); Rothe, *Traité de droit naturel* (Paris, 1884-95).

NATURAL RIGHTS. See NATURAL LAW.

NATURAL SELECTION. The evolution idea is as old as the time of the Greek philosophers, but that form of it called natural selection, or Darwinism, dates from 1858, when the theory was stated by Darwin (q.v.) and also by Wallace (q.v.), each independently of the other. Nearly a century earlier Buffon, and afterwards Erasmus Darwin, had suggested that species were mutable, and that all living beings had descended from some primitive type or germ, the transformation having been effected by changes of climate, food, exercise, and so on. But the real founder of the modern theory of organic evolution was Lamarck (q.v.; see also LAMARCKISM). The chief agents or factors of organic evolution which he proposed were changes of environment, of climate, soil, food, temperature, use, and disuse, while he briefly mentions the agency of competition, the results of geographical isolation, and the swamping effects of crossing, besides use-inheritance. Although supported by a few, though well-selected, facts, Lamarck's views were, owing to the influence of Cuvier, and the deep-seated prejudice of the times, ignored and well-nigh forgotten, except to be called up and ridiculed. Yet between the date of Lamarck's death in 1829 and shortly be-

fore 1858 nearly thirty naturalists, most of them of eminence, had publicly enunciated in a tentative way evolutionary views—among them Grant, Wells, Naudin, D'Halloy, Schaaffhausen, Wallace in 1855, and others. Meanwhile Hutton and Lyell had advanced uniformitarian views in geology. Progress in the knowledge of the flora and fauna of the earth had greatly increased. The cell doctrine had been advanced; the sciences of paleontology, embryology, and morphology had been founded and were rapidly gaining ground.

As early as March, 1852, Herbert Spencer, in an essay published in the *Leader*, advocated the theory of the modification of species by changes of environment, and a few years later adopted the word 'evolution,' applying it to psychology, and later to sociology and comparative religion.

HISTORY OF THE RISE OF THE SELECTION THEORY. Such was the state of certain isolated scientific and philosophic minds, though the rank and file of naturalists were either indifferent or opposed to the theory of descent, when in 1858 the preliminary essays of Darwin and of Wallace were given to the public. Their views, which were destined to give such a decided impulse to biological inquiry, were independently confirmed by several biological experts after years of experience and research in all parts of the globe. The botanist Sir Joseph D. Hooker, when surgeon and naturalist of the *Erebus* in the Antarctic expedition under Sir John Ross, published a flora of New Zealand, a *Flora Antarctica*, and in 1859 published his *Introduction to the Flora of Australia*, in which he advocated the selection theory. Before this (1858) Wallace had spent four years on the Amazon, and afterwards eight years in the East Indian Archipelago, making large collections and careful observations. Meanwhile Charles Darwin, as the naturalist of the *Beagle* for nearly five years (1831-36) during her voyage around the world, was constantly exercising his marvelous powers as an observer. What chiefly led him, as early as 1839, to begin to favor the theory of descent, were his observations on the fossil mammals, the colossal armadillos and sloths, and the like, of South America, which appeared to be the ancestors of the degenerate forms now living; also the occurrence of local species on each of the Galapagos Islands, which he found to be very similar to those of the South American coast, and yet slightly different. The result was that after twenty years of observations, experiments in his garden, and reflection, he elaborated the theory of natural selection.

On the first of July, 1837, he opened his first note-book to record any facts bearing on the origin of species, but "did not become convinced that species were mutable until two or three years had elapsed." More than a year after (October, 1838), he says: "I happened to read for amusement Malthus on *Population*, and being well prepared to appreciate the struggle for existence which everywhere goes on from long-continued observations of the habits of animals and plants, it at once struck me that under these circumstances favorable variations would tend to be preserved, and unfavorable ones to be destroyed. The result of this would be the formation of new species." It is worthy of notice that Malthus was the father of natural selection, that the *Essay on Population* was the source of inspiration of both Darwin and Wallace, and that to

this fact is apparently due the exact similarity in, or coincidence of, their views. Darwin's preliminary essay, together with that of Wallace, who had also read Malthus's *Essay on Population* containing nearly identical selection views, was published in 1858. In the following year appeared Darwin's epoch-making *Origin of Species*. His theory was at once accepted by Canon Tristram, Lyell, Hooker, Bates, Huxley, and others in Great Britain; in the United States of America by Asa Gray and Jeffries Wyman, and in Germany by Haeckel, while Fritz Müller, working on the same lines in Brazil, fully accepted and extended his views. That the time was ripe for the development and growth of the evolutionary idea was proved by its speedy and general acceptance by nearly all working naturalists and thoughtful minds. Moreover, the selection phase was easy to understand by laymen, and soon the multitude accepted the new views.

THE NATURAL SELECTION THEORY EXPLAINED. The theory of natural selection is based on the facts of variation. As to the causes of variation, Darwin does not say much in the *Origin of Species*. Basing his theory on the fact that variations are constantly and spontaneously arising, he claimed that the favorable variations have succeeded in the struggle for existence, while those unfit or unfavorable have perished.

He also remarked that as long as the conditions of life remain the same, we have reason to believe that a modification which has already been inherited for many generations may continue to be inherited for an almost infinite number of generations. We are also told that as each land had undergone great physical changes, we might have expected to find that organic beings have varied under nature in the same way as they have under domestication. "And if there be any variability under Nature, it would be an unaccountable fact if natural selection did not come into play." "If, then," he asks, "animals and plants do vary, let it be ever so little or so slowly, why should we doubt that the variations or individual differences which are in any way beneficial would be preserved and accumulated through natural selection, or the survival of the fittest? If man can by patience select variations useful to him, why, under changing and complex conditions of life, should not variations useful to Nature's living products often arise, and be preserved or selected? What limit can be put to this power, acting during long ages and rigidly scrutinizing the whole constitution, structure, and habits of each creature—favoring the good and rejecting the bad? I can see no limits to this power, in slowly and beautifully adapting each form to the most complex relations of life."

GEOMETRICAL RATIO OF INCREASE OF ORGANISMS. "A struggle for existence," says Darwin, "inevitably follows from the high rate at which all organic beings tend to increase." There is a vast destruction of seeds, eggs, embryos, and young. Were this not the case the earth would soon become covered with the progeny of a single pair. Linné pointed out that an annual plant producing two seeds only—and there is no plant nearly so unproductive as this—and these each producing two in the following year, and so on, would in twenty-one years produce over a million plants. The elephant is regarded as the slowest breeder of all known animals, yet a single pair would become in the course of about seven and a

half centuries, if all lived to the close of the breeding age, the ancestors of nearly 19,000,000 elephants.

The rate of increase of an animal, each pair producing ten pairs annually, and each animal living ten years, is shown in the following table, copied from Marshall's Lectures:

YEAR	Pairs produced	Pairs alive at end of year
1.....	10	11
2.....	110	121
3.....	1,210	1,331
4.....	13,310	14,641
5.....	146,410	161,051
10.....		25,937,424,600
20.....	2.....	Over 700,000,000,000,000,000

Immense numbers of eggs are laid by certain animals, and yet there are probably no more individuals now than centuries ago, the number of individuals remaining as a whole stationary. The queen bee lays during her whole life a million eggs, the conger eel is estimated to deposit 15,000,000, the oyster from 500,000 to 16,000,000, and a very large oyster may produce even 60,000,000 of eggs. "Supposing," says Marshall, "we start with one oyster and let it produce 16,000,000 eggs, the average American yield, and let half, or 8,000,000, be females and go on increasing at the same rate; in the second generation we shall have sixty-four millions of millions of female oysters. In the fifth generation—i.e. the great-great-grandchildren of our first oyster—we should have thirty-three millions of millions of millions of millions of millions of female oysters. If we add the same number of males we should have in all 66 + 33 naughts. If we estimate these as oyster-shells, we should have a mass more than eight times the size of the world."

Darwin also claimed that natural selection "acts solely by accumulating slight, successive, favorable variation," and can produce no great or sudden modification. It can act only by short and slow steps, hence "the canon of *Natura non facit saltum*, which every fresh addition to our knowledge tends to make truer, is on this theory intelligible."

USE AND DISUSE. Darwin in some cases admits the action of use and disuse. In both varieties and species, he says, use and disuse seem to have produced a considerable effect. His examples are blind cave animals, the burrowing South American 'tucutucu,' which is occasionally blind, and certain moles; also the logger-headed duck, which has wings incapable of flight, in nearly the same condition as in the domestic duck. Instincts he regards as having been slowly acquired through natural selection. See **USE-INHERITANCE**.

THE GEOLOGICAL RECORD. He then dwells on the geological record, which, although it is very imperfect, yet the facts strongly, he claims, support the theory of descent with modification. The extinction of species and of whole groups of species almost inevitably follows from the principle of natural selection; for old forms are supplanted by new and improved forms. The fact, he says, that the fossil remains of each formation are in some degree intermediate in character between those in the strata above and below, is simply explained by their intermediate position in the chain of descent. The grand fact

that all extinct beings can be classed with all recent beings naturally follows from the living and the extinct being the offspring of common parents. Species have generally diverged in character during their long course of descent and modification, and thus the more ancient types are in some degree intermediate between existing groups. Recent forms are more improved and generally more specialized than the earlier ones. Yet certain forms have retrograded, while others have retained 'simple and little improved structures,' being what are called 'persistent types.'

GEOGRAPHICAL DISTRIBUTION. The facts of geographical distribution are also utilized by Darwin, who calls attention to the past migrations of animals from one part of the world to another owing to former climatic and geographical changes. They also explain why on the same continent under the most diverse conditions most of the inhabitants within each great class are plainly related, the reason being that they are the descendants of the same progenitors and early colonists. They explain why oceanic islands are inhabited by only few species, most of these, as those of Madagascar, being peculiar or endemic species. Moreover, the existence of closely allied or representative species in any two areas, as Europe and North America, implies that the same parent forms formerly inhabited both areas. It is also the rule that nearly all the inhabitants of islands have been derived from ancestors which lived on the nearest mainland. Thus the plants and animals of the Galapagos Archipelago, of Juan Fernandez and the other American islands, are closely related to those of the neighboring American mainland, while those of the Cape de Verde Archipelago and other African islands were derived from the opposite African coast.

FACTS OF MORPHOLOGY, EMBRYOLOGY, THE DOCTRINE OF HOMOLOGIES. These were also drawn upon by Darwin. He maintained that adaptive characters, though of paramount importance to the beings, are of hardly any importance in classification, while vestigial characters are often of high classificatory value, the most valuable of all often being embryological characters. "The real affinities of all organic beings, in contradistinction to their adaptive resemblances, are due to inheritance or community of descent."

NATURAL SELECTION NOT THE EXCLUSIVE MEANS OF MODIFICATION. It should be observed that Darwin frankly expressed the conviction that natural selection, though the most important, has not been the exclusive means of modification. He allowed that the absence of eyes in cave animals is not the result of natural selection, saying: "I attribute their loss wholly to disuse."

THE CAUSES OF VARIATION. In the first edition of his *Variation of Animals and Plants Under Domestication*, Darwin, after defining the definite action of the environment, added: "A new sub-variety would thus be produced without the aid of natural selection," but this passage was omitted from the second edition. Besides the *Origin of Species* Darwin published a number of other works, the most important of which was *The Variation of Animals and Plants under Domestication* (1868). Toward the end of his life he gave more attention to the causes of variation, which at first he said were unknown, and in the work just cited he says: "Changes of any kind in the conditions of life, even extremely slight changes, often suffice to

cause variability" (2 ed., ii., p. 258); and again: "Variations of all kinds and degrees are directly or indirectly caused by the conditions of life to which each being, and more especially its ancestors, have been exposed," adding: "To put the case under another point of view, if it were possible to expose all the individuals of a species during many generations to absolutely uniform conditions of life, there would be no variability" (ii., pp. 253, 255-256). He attributes the differences in races of cats living in Paraguay, at Mombasa, East Africa, and in Antigua, "to the direct action of different conditions of life" (i., p. 49); so with the horses of the South American pampas and of Puno. He refers to Dr. J. A. Allen's conclusions relative to the direct action of the climate in producing geographical varieties of birds, and concludes that "these differences must be attributed to the direct action of temperature" (ii., p. 271). So also, accepting the results of Meehan's comparisons on the leaves of 29 kinds of American trees with their nearest European allies, Darwin candidly admits that "such difference cannot have been gained through natural selection, and must be attributed to the long continued action of a different climate" (ii., p. 271).

The objections to his theory raised by Darwin himself he discusses with his usual candor. Of these the most important is the absence, to use his own words, of the "interminable number of intermediate forms," which must have existed, "linking together all the species in each group by gradations as fine as are our present varieties." He says he can only answer this objection "on the supposition that the geological record is far more imperfect than most geologists believe." The other objection is the existence of two or three castes of worker or sterile ants in the same community.

STATUS OF DARWINISM AT THE PRESENT DAY. Such are the views of Darwin, as published in his *Origin of Species*. Although he pushed the special form of evolution to what one would suppose to be its furthest limits, yet as we have seen he somewhat modified his views later in life. The views of probably a large proportion of the moderate Darwinians at the present time have been expressed in a broad and candid way by Romanes, an able and careful commentator and expounder of the doctrine of natural selection. In his *Darwin and After Darwin* (1892), the most clear and readable exposé of the doctrine, the doctrine is thus stated. All plants and animals are perpetually engaged in the struggle for existence. This strife consists in the fact that in every generation of every species a great many more individuals are born than can possibly survive. Now nature "selects the best individuals out of each generation to live." "And not only so, but as these favored individuals transmit their favorable qualities to their offspring according to the fixed laws of heredity, it further follows that the individuals composing each successive generation have a general tendency to be better suited to their surroundings than were their forefathers. . . . And this follows not merely because in every generation it is only the 'flower of the flock' that is allowed to breed, but also because, if in any generations some new and beneficial qualities happen to arise as slight variations from the ancestral type, they will (other things permitting) be seized upon by

natural selection, and, being transmitted by heredity to subsequent generations, will be added to the previously existing type." At the present day an increasing number of evolutionists do not regard natural selection as an active cause, but rather as the result of the action of a number of other agents, comprising the Lamarckian factors of change of environment, use, disuse, isolation, and so on. Undoubtedly, as the result of competition, animals have been driven to migrate, to adopt new habits, and thus to undergo modification. Many agree with Herbert Spencer as to the inadequacy of natural selection to account for the origination of new forms. From probably a third to nearly one-half of the species of plants and animals now existing are climatic, local forms, resulting from the direct action of changes in the conditions of life, such as climate, soil, food, and the like. The great number of species of parasitic animals are the result of the young adopting a fixed or a more or less stationary mode of life. Natural selection is inoperative in the case of blind or eyeless cave and deep-sea animals.

OBJECTIONS TO NATURAL SELECTION. The objections now being urged to the special doctrine of natural selection are that, (1) to use Herbert Spencer's words, it is 'inadequate'; (2) the favorable variation may be destroyed by the swamping effects of crossing; (3) natural selection is not analogous to artificial selection; nature is continually eliminating monstrosities, sports, variations, instead of preserving them; they are constantly being bred out in wild plants and animals, or those living under natural conditions of existence. The otter or ancon sheep, which under the breeder's care and watchfulness became a peculiar variety, when permitted to mingle or cross with normal sheep became extinct. Natural selection accounts for the preservation rather than the origination of new or incipient forms and structures. For the causes of variation, it is maintained, we must look to the action of the primary factors of organic evolution, namely to the effects of changes in light, temperature, heat, moisture, dryness, altitude, food, and so on.

(4) It is not necessarily the fittest or most useful structures or individuals which survive. Carnivorous animals in seizing or swallowing immense numbers of eggs, embryos, and adult animals do not select this or that individual, but, on the contrary, old and young, the fit and the unfit, weak and strong, are engulfed in the maw of the whale as it swims through a shoal of minute crustacea; or hundreds of small fishes are indiscriminately, without reference to their fitness, swallowed by sharks. So with aphides existing in hundreds of thousands on some tree, the birds, like old Time of the New England Primer, indiscriminately pick off "all, both great and small." This matter of the survival of the fittest and the extinction of the unfit has perhaps been somewhat exaggerated, although it is granted that competition acts unceasingly in the biological environment.

(5) Darwinians acknowledge, as does Wallace in his *Darwinism*, that no one ever saw a species originated by natural selection; Weismann has frankly affirmed that "it is really very difficult to imagine this process of natural selection in its details; and to this day it is impossible to demonstrate it in any one point" (*Con-*

temporary Review, 1893, p. 322). Yet a number of temperature species, races, or breeds have been experimentally produced by changes of temperature. The cases of seasonal dimorphism existing in nature have been exactly paralleled by variations in moths and butterflies subjected in the pupa state to cold, or extreme heat; and dry-season and wet-season as well as summer and winter forms have been produced artificially, besides other variations supposed to be extinct phylogenetic species.

(6) The view peculiar to Darwinism is that some individual variation was nursed and preserved, while all the others less favorable died. Some naturalists claim that the better-founded view is that of Lamarck, that the changes of environment simultaneously affected great numbers of individuals in a given region, which became modified by changes of climate, and so on, *en masse*. This certainly appears to be the case in local, insular, or geographical races, varieties, or species. What affects one affects all the individuals in a given area isolated by mountain barriers or other natural boundaries. Where natural selection appears to act is in the case of protective mimicry. The initial causes are changes in the amount of light, of shade, heat, and other physical agents, yet natural selection appears to be operative in bringing out the wonderful cases of mimicry so well known. (See *MIMICRY*.) While therefore the Neo-Lamarckian readily acknowledges that natural selection results after new variations have arisen, there are those who, like the Rev. Mr. Henslow, maintain that in the case of seedlings natural selection is not concerned in bringing about the survival of the fittest, adding: "A seedling survives among others solely because it is vigorous." He claims that as soon as a large number of seedlings appear above ground, "natural selection at once steps in, so to say, with the result that all those with too weak a constitution to maintain themselves fail to withstand the struggle for existence and to come to maturity, the stronger plants only proving themselves the best fitted to survive. This process of selection, however, is quite independent of any modifications in morphological structure, by which 'varieties' or subspecies are alone recognized." The fact that the majority of offspring always perish in infancy he calls 'constitutional selection.'

(7) Darwin expressly regarded most variations as indefinite, chance, fortuitous, spontaneous or promiscuous, 'survival of the fittest,' as Romanes expressed it, "becoming the winnowing fan, whose function it is to eliminate all the less fit in each generation, in order to preserve the good grain, out of which to constitute the next generation. And as this process is supposed to be continuous through successive generations, its action is supposed to be cumulative, till from the eye of a worm there is gradually developed the eye of an eagle." Other variations Darwin called 'definite.' In the chapter of his *Variation of Animals and Plants Under Domestication*, entitled "Direct and Definite Action of the External Conditions of Life," he says: "By the term definite action, as used in this chapter, I mean an action of such a nature that, when many individuals of the same variety are exposed during several generations to any particular change in their conditions of life, all or nearly all the individuals are modified in the same manner."

This appears to be practically the same view as that which was advanced by Lamarck, and which is called by Eimer 'orthogenesis' (q.v.).

Variation as the result of changed conditions is in nearly every case—perhaps four-fifths of all that occur, thus leaving very little scope for the play of chance or fortuitous variations—due to causes of which we are ignorant. Fortuitous variations, in fact, are an almost negligible quantity. Hence the primary postulate of natural selection that variations are in general fortuitous is in the nature of an assumption, and not based on observed facts. As the result of recent investigation we are coming more and more to the view that variation in general is the result of the action of changed conditions of life, conditions both physical and biological, and that natural selection is not an active agent.

(8) Since Darwin called attention to the lack of long series of intermediate links between species, naturalists have been more and more inclined to the belief that such series of connecting variations have never existed, but that nature makes leaps, that species often arise by sudden or 'quick' or saltatorial evolution. Certainly neither in the Paleozoic or later strata, nor at the present time, do we observe these series of minutely graduated numberless annectant forms postulated by Darwin, there still being gaps between the known connecting links. Hyatt, W. H. Dall, Galton, De Vries, and many others, have advocated the view of the rapid or sudden modification of structure involving the sudden appearance of species, especially in Paleozoic times. This is seen by the results of the examination of the Steinheim forms of Planorbis, and of the Tertiary forms of Austrian Paludina, where there are often wide gaps even between the connecting links. The new species of evening primrose raised by De Vries originated suddenly, without preparation or intermediate forms. Even in the great variations observed by C. C. Adams in the forms of the fresh-water snail *Io*, peculiar to the upper tributaries of the Tennessee River above Chattanooga, the variations are evidently due to the varying nature of the bottoms of the streams, the rapidity of the current, and the forced isolation of the varieties, the different forms, from smooth to very spiny, being closely correlated to the varying nature of each stream, and different sections of each stream from the headwaters to the mouth. In this case there is apparently no action of natural selection, but a direct response to the environment, and the gaps may thus be either marked or slight. In the hundreds of sub-varieties of *Helix nemoralis*, the gaps or intervals between such forms are distinct and well marked.

(9) Natural selection is manifestly inadequate to account for the origin of the principal types or classes of plants and animals. They must have appeared with comparative suddenness, as the result of changes of the conditions of life, inducing new needs, new habits, and the origin by exercise of new organs. Thus the types of coelenterates, echinoderms, crustacea, flying insects, amphibia, reptiles, birds, and mammals were the result of the action of the changed environment, of effort, use, isolation, and heredity, at a time when the ancestral forms were more plastic than their descendants.

(10) Natural selection, it has been claimed, could not have begun to act until the earth had

become sufficiently well stocked with plant and animal life to afford materials for competition and survival of the fittest. The first forms of life must have arisen through the operation of the Lamarckian factors. In conclusion it may be said that it still remains an open question whether natural selection is an active or by any means universal agent in evolution. Finally it may be observed that the processes of evolution are in kind like those of simple growth of the individual organism, and due to the same factors, and as in ontogenesis there is no one predominant factor, so in phylogenesis there is no one predominant factor, no preponderating mechanism such as has been ascribed to natural selection. In the opinion of some expert working naturalists, the greater number of known species have been produced without its aid. It is not of the same nature as artificial selection. Yet the theory is widely accepted, and by its aid Darwin converted the world to a belief in evolution in general.

The views 'widely accepted' as to the relation of natural selection to the other factors of organic evolution may be tabulated thus:

I. Primary factors.

Direct.—Changes of cosmical environment, changes of climate, light, darkness, temperature, dryness, and humidity, physical and chemical constitution of the soil and of waters, mechanical state of the *milieu*, winds, currents of water, biological environment, food, competition, parasitism, symbiosis.

Indirect.—Reaction against cosmical environmental conditions; adaptation, convergence, reaction against biological conditions, mimicry.

II. Secondary factors.

Heredity, vital concurrence, natural and sexual selection, segregation, geographical isolation, amixia, hybridity.

For bibliography, see EVOLUTION.

GERMINAL SELECTION. This doctrine, founded by Weismann, is an extension of the general idea of natural selection. To 'superorganic' selection, ordinary 'individual' or 'personal' selection, Roux's theory of histological ('histonal') or intracellular struggle for existence, Weismann has added the idea of a struggle among the hypothetical 'determinants' within the germ, or germinal selection. J. A. Thompson has indicated the importance of a form of struggle lying between Roux's histonal selection and Weismann's germinal selection, namely, the struggle between gametes or potential gametes, e.g. between young ova, between sperms, even between ova and sperms. "A vivid realization of this visible struggle," says Thompson, "and the sometimes discriminate selection which it implies, may lead naturally to an appreciation of germinal selection, which deals with the wholly invisible." Although opinions may differ as to the existence of this hypothetical phase of selection, the writer just quoted claims that the theory "justifies itself provisionally as a formula unifying a large number of otherwise unrelated facts of inheritance." See WEISMANNISM.

NATURAL THEOLOGY. The systematic arrangement of that knowledge as to God and man and their mutual relations which can be gained from the study of nature to the exclusion of revelation. Such, at least, is the ideal of

natural theology and its effort, as it was pursued for a large part of the last century. But it never maintained the actual independence of revelation which it was supposed to maintain. The proofs for the existence of God (q.v.) really presuppose the idea of a holy first cause, and this idea is historically derived from the Christian revelation. Without this suggestion the proofs are inconclusive. But with this allowance to revelation, natural theology has a place and a work in the development and defense of Christian doctrine. It exhibits the conformity of the idea of God to the highest reason of man. The proper founder of the discipline among English-speaking theologians was Archdeacon Paley, who published his *Natural Theology* in 1802. The merits of this work have been lately overlooked, and it has been the fashion with many who never read him to sneer at Paley's arguments. In fact, the book was a very able one, and anticipated the lines of reply by which the first attacks of the more recent propounders of evolution upon the existence of God have been met. In America the rationalizing spirit of the New England Theology (q.v.) led it to lay much weight upon natural theology, and it was generally ostensibly made the basis of the system of theology by theologians of this school, and by most others, during a large part of the century. The arrangement of topics in the best forms of the science were somewhat as follows: Beginning was made with the principle of causation, which was established as a necessary truth, or primal intuition of the human mind. Then came the arguments for the existence of God, predominantly or exclusively the *a posteriori* arguments, for a contriver, governor, creator, preserver, and moral governor. Then followed the natural attributes of God. In making the transition to the moral attributes, it was sometimes the custom to interpose the doctrine of the immortality of the soul, and discussions as to the consistency of the existence of sin in the world with the divine goodness, in order antecedently to remove the most difficult objections to the divine benevolence. Where the moral attributes of God were reduced to the one attribute of benevolence, it was next customary to introduce the theory of human virtue, and to argue from benevolence as the ultimate object of the obligation of the human conscience to the nature of the divine virtue, since man is made in the image of God. Finally, the benevolence of God having been proved, the argument could advance to the Scriptures, the inspiration of which was proved by the need of man for revelation, and the certainty that a benevolent God would supply so grievous a need. This line of discussion was largely broken up at the end of the century by influences emanating from the more subjective schools of German theology, especially from Frank and Ritschl. Besides Paley, consult: Chadbourne, *Natural Theology* (Boston, 1867); Flint, *Theism* (Edinburgh, 1878); id., *Anti-Theistic Theories* (ib., 1879); Janet, *Final Causes* (Eng. trans., ib., 1878); Browne, *Studies in Theism* (New York, 1879); id., *Philosophy of Theism* (ib., 1887); Harris, *The Philosophical Basis of Theism* (ib., 1883); Fisher, *Grounds of Theistic and Christian Belief* (ib., 1883).

NATURAL TONES. A musical term applied to those tones of wind instruments that

are produced, without altering the length of the tube (by valves or slides), by increased or diminished force of the air-current. The tones thus produced are always overtones of the fundamental tone. But this fundamental tone can be produced only upon instruments having a wide bore in proportion to their length, like the tuba or trombone; whereas the fundamental cannot be produced upon the trumpet, which, consequently, yields only the higher overtones as natural tones. See HARMONICS.

NATURE PRINTING. A process by which engravings or plates are produced by taking direct impressions of the objects themselves, and printing from them. The process was invented in 1849 by Alois Auer, director of the State printing establishment of the Austrian Empire, and, though very simple, it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of steel and another of lead, both of which are smooth, and polished. They are then drawn through a pair of rollers under considerable pressure, and when the plates are separated it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; but it is too soft to resist the action of the presses for practical purposes; a fac-simile to be used as the printing plate is made in copper by the electrotype process. The inventor published a description of his work in 1854 at Vienna, in which is given a detailed account of the method.

NATURE-STUDY. A modern development of the movement of elementary education toward the study of real objects rather than symbols. It arose in response to a demand voiced as early as the year 1845 in this country by Horace Mann (q.v.) for early training in the inductive method of thought and in the field of nature.

According to generally accepted ideas on nature-study, it must concern itself with the common objects of the child's environment. These the child must be led to examine, to work with himself. The work must be carried on, so far as possible, to strengthen independence of thought and judgment. The beginnings of the study must be based upon the immediate surroundings of the child, and the field of inquiry may be extended further abroad as the later years of the school are approached. The tasks in the earlier years should be chiefly observational. Nevertheless, the experimental method of study should not be neglected. As far as possible, organic forms should be regarded as living things capable of activity and change; the point of view should therefore be dynamic, a matter of great pedagogic importance. The plan of the work may properly be made out so as to include the commoner animals and plants, and the everyday phenomena of inorganic nature. Duplication of work should be avoided by increasing the difficulty of the problems and basing them on different material. It is better to study the materials comparatively as far as possible, so that pupils may learn to discriminate and to form general notions. The exhaustive study of one type is of much less value. Outdoor work

should be done; in addition to gardening, studies of the habits and haunts of animals, the appearance and disappearance of the birds, the relations of insects to plant life, the appearance of trees in summer and winter dress, and numerous other similar topics may form the basis of study. It is highly important that the materials should be abundant, that the teacher be not too closely tied to a detailed plan of work, and that he be resourceful in the matter of making the most of what is available. It is important, too, that the pupils should provide their own material, and to this end both the excursion and the garden should be turned to account. It would seem best, on the whole, to devote, at any rate, two periods (one to two hours) a week, or its equivalent, throughout the course. The school garden has in some cases been provided for after-school hours, and this seems to be a reasonable adjustment of the matter.

NATURE-WORSHIP. The worship of all objective phenomena which man regards as liable to hurt or help him, and which even when lifeless are deprecated or invoked as powers having volition. Nature-worship is based on spiritism, but this, not being in itself a religion, but a philosophy, does not imply worship. In many cases the savage simply regards rocks and trees as volitive powers only when they act in a way suggesting volition. So long as a stone, for example, does not interfere with him, he is apt to disregard it altogether; but when it injures him, or he wishes to use it, he assumes, like a child, that it possesses spiritual power expressed by will. Whether then the savage deprecates or placates, the cult of such an object is a religious phase. Even in the lowest stages of human evolution, it may happen that some one object, like the village tree of the Aryan, or the clan mountain of the Munda, or the family snake of some Dravidians, is regarded as tutelary, and offerings and prayers are made to it, although other natural phenomena are either ignored or treated only as inimical spirits. This may be said to be a stage between demonolatry and nature-worship, though a more general cult of phenomena usually accompanies the worship of any one side of nature. Nature-worship, manifold as nature, shows aspects which may be grouped in categories, but in no classification can a sharp line be drawn between the different divisions. In arranging the objects of worship only a rough classification, therefore, will here be attempted. As parts of objective nature on a par with others must be included both man and animals, though these are often put into special categories.

WORSHIP OF ELEMENTS. As constituents of all nature the elements are worshiped by philoso-

phers, but it is quite doubtful whether, as has often been claimed, the elements were ever worshiped as such by savages, or even by more advanced people till a late period in their development. Mother Earth is a very early divinity, but in this case she is not the element, but a local ground, generally a hill. Water is certainly not worshiped as divine till long after the local stream or spring is, or contains, a divinity. Thus the American Indians worshiped Niagara as a spirit, but did not regard water as a divinity. Ganges and Tiber were local tutelary gods long before abstract (elemental) water was revered. So air is unknown as an early divinity, but as wind personified it was worshiped as Huracan in America and as Wodan in Germany. East Wind is a modern malevolent Hindu god, while to the Mexicans the East Wind was a beneficent deity. Even fire is revered as a local form before fire in general is regarded as divine. Of all the elements, fire has been most universally worshiped, partly on account of its force and mystery of birth in threefold form, on earth, in the sky, and in the air (lightning), and partly because of its purificatory nature. The cult of this element became the chief religious observance of Mazdeism. Mystic association between mental and physical attributes helped to increase the reverence for elemental gods. Fire and force were associated, water and wisdom, etc. The fish god of Babylonia and the fish god of Polynesia both typify the union of water and wisdom, found also in the worship of the Hindu Varuna. See *Astrolatry*, below.

LITHOLATRY. There are in all four forms of litholatry or stone-worship, the stone appearing to be in general one of the earliest forms of divinity. (1) Of these the most primitive, judging by the fact that it is found among the lowest savages, is the worship expressed by showing religious (superstitious) awe for any remarkable stone. There are three varieties: (a) the worship of a huge rock, scarcely to be differentiated from the worship of a mountain (see below); (b) the worship of a stone peculiar in shape, especially if it suggests a resemblance to the shape of an animal or of man; (c) the worship of a heavenly stone. All three varieties are found among the Finns and Lapps, among the negroes of Africa, and among the South Sea Islanders. To a less degree this form of worship is shared by the Peruvians, but with them it has been overlaid with later forms. In antiquity, remarkable stones, especially *aërolites*, were worshiped by the Greeks and Romans, and they are to-day an object of reverence to all savages—as, for example, the Eskimo—while even among civilized people the 'Thunder-stone' is regarded with more or less superstitious awe. Any strangely shaped stone is revered by the Hindus, especially those in South India, by the inhabitants of the Hebrides, the Pyrenees, and by the redskins, to mention only a few of the races that worship stones. The Semites, Greeks, and Romans in antiquity, and the Teutons in the Middle Ages, all worshiped stones by anointing them, making offerings (sometimes human sacrifices), and saying prayers to them. (2) By imperceptible degrees the plain stone becomes an idol; that is, it represents a divinity or a divine power. Two forms may be distinguished: (a) when a fetish-stone is discarded from personal use, but is preserved as imbued with divine

(mysterious) power in an African 'god-hut.' This shapeless effigy leads to (b) pure idol-worship; that is, where the effigy is due to an attempt to shape the stone to a divine form human or beastly in attributes. Images of gods are recognized by Homer and seem to be referred to in the *Rig-Veda*, but these works represent an advanced stage of culture. Idols are not found among the lowest races. Savages, such as the Bushmen, Patagonians, Eskimo, Andamanese, have no idols. But theists like the Finns and Polynesians are idolaters, as are still more advanced races, the Mexicans, Egyptians, Babylonians, Greeks, and Hindus. (3) The fetish, often a stone, is worshiped. Accident, precedent, any peculiarity prompting the fancy that the object will be beneficent is sufficient to make a fetish. When no longer regarded as useful the fetish is flung away or laid aside in a god-hut. The fetish-worshiper scarcely makes a distinction between the divine power in a fetish and the inherent divinity of a fetish. There are certain clans in Africa which believe that there is a divine power in, but separate from, the object; but most fetish-worshipers probably make no distinction between the power and the thing. (See FETISHISM.) (4) A stone is often worshiped also either as a totem or as the result of totemism (q.v.). The latter stage of worship is so far advanced beyond totemism as to be a new form of nature-worship. It arises in this way. When a totemist sacrifices to his totem he sheds blood near or on a stone which was originally the temporary habitat of the ancestral spirit. The stone itself in the first stage is revered only incidentally; but when successive generations have thus hallowed a stone, the divinity becomes gradually extended to the stone itself, and the primitive tomb-altar becomes itself a thing prayed to as a divinity. So the Australian *Churinga* sticks are revered as homes of the ancestor spirits and the redskin totem-poles are themselves divinities. So sun-stones, symbols of the sun, such as the white sun-stone of the Scandinavians, become divinities, even when the symbol does not (as is often the case) merely conceal an older form of worship. But many worshiped stones were originally only monuments. The long-famed Jupiter Lapis or 'stone Jupiter' is now known not to have been a 'stone god,' a fact which indicates that other stone gods also may have been misinterpreted. As the huge stone is revered, so is a huge cliff or mountain, generally as a local tutelary divinity. Mountains are believed to have an individual life and may beget offspring on rivers, being thus regarded as divine powers, though they usually take animal forms when acting as animate beings. Very old and widespread is the belief that a man's individual life may be deposited in a mountain or tree, and be destroyed only when the divine object is overthrown by a higher divinity.

DENDROLATRY. Under this word may be included the 'worship of trees,' in the strict sense, and the worship of plants, phytolatry, in the general sense of worship of objects of the vegetable world. The terms, however, are not quite coterminous, since plants are revered only as totems or as useful objects, while trees are worshiped for a variety of reasons, either because they are totems, or because they are useful, or beautiful, or fearsome, or as symbols. In this phase of

worship it is sometimes difficult to decide whether the divinity resides in the object or is the object. Both views were held by different members of some races. Thus this question became a subject of debate between the Brahmins and the Buddhists. The former held what is undoubtedly the more primitive belief, that the tree itself was an animate person. The Buddhist held, as did the Greek, that there was a spirit (dryad) in the tree. The worship of some form of the vegetable creation was general in antiquity, and has existed almost to the present day in Europe. Only a few hundred years ago the Teutons, for example, worshiped plants and trees, as they did rocks, rivers, and mountains. Traces of this belief are still visible in popular rites and superstitions. Both men and gods were supposed to have sprung from trees. Thus the Algonquin Indians and the Teutons both regarded the ash as the divine progenitor of men, and the mother date-palm was worshiped by the Semites, as other mother trees are to-day worshiped by the Dravidians. There are four varieties of plant and tree worship. The vegetable god, tree, or plant is revered (a) for its peculiar virtues or qualities. Thus in India the *soma* plant was regarded as divine because of its intoxicating qualities, as is the *coca* plant in Peru; and the modern *peyote* cult of Mexico has the same origin. Or (b) the vegetable is a totem, examples of which are found in the divine corn and cocoanut of America and Samoa, respectively. Thirdly (c), the tree or plant is worshiped as a spirit in the material, as is the case in dryad-worship in Greece and India. Finally (d), the spirit revered is that of reproduction as shown in the vegetable, of which class are the corn mother of the Teutons and the mother date-palm of the Babylonians. To these must be added the sacred grove, as revered by Dravidians, Teutons, Greeks, Romans, etc. The trees of the grove are collectively sacred and may be individually divine; but the grove itself is really a temple of divinities, not a divinity *per se*. Tree-marriages, still common among the wild tribes of India, are a survival of totemism. To avoid the ill luck of a third marriage, even civilized Hindus wed a tree as a third wife.

THERIOLATRY OR ZOOLATRY. Animal gods already have human characteristics and are quite anthropopathic. Love or fear, as in the case of human gods, prompts that greater respect which with savages constitutes worship. This is especially easy in the case of animals, for savages establish no barrier of soul and reason as peculiar possessions of man between themselves and beasts. A very early belief in metempsychosis (q.v.) taught primitive man to believe that beast soul and human soul were interchangeable. Thus the tiger is worshiped not only from fear, but because a special tiger is often believed to possess the soul of a departed chief. Some animals become divine as totems, but not all. Ordinary pests are deprecated by prayer and offerings. Some animals are worshiped merely because they are useful. The best developed systems of theriolatry are found among the Egyptians, Babylonians, and American Indians. But some of the monstrous beasts of Babylon are adored through symbolism rather than because of totemistic survivals. Reverence alone prompts man to make the image of god-beasts more powerful and mysterious than the natural beasts, and some of the beast forms are clearly symbolic, as in the portrayal of the

sun as a swift horse or as a winged bull, or of spring as a winged snake. Of all forms of beast-worship, *ophiolatry* or serpent-worship seems to be most widespread. Other animals, horse, ass, reindeer, bear, tiger, boar, together with a few cases of divine fishes are worshiped by different races; but the snake appears to have been worshiped in every land, either as a soul-receptacle or friendly house-snake, in whose body resides the soul of an ancestor (as in Rome and India), or as a healing and mantic power of wisdom (as in the cults of Babylon and Greece), or as an evil spirit, world-snake or dragon. The negroes of Africa, the Dravidians and redskins among savages, the Mexicans and Peruvians on a higher plane, and the Egyptians, Greeks, Romans, and Semites (including Hebrews) regarded the snake in one or another of these forms as a divine animal. Sometimes the same snake is conceived differently at different times. In Sayce's opinion, Nina, the Babylonian serpent daughter of Ea, the water-god of wisdom, was at first typical only of divine wisdom, and the transference to the conception of the guile-loving evil serpent was due to the influence of the parallel conception of Tiamat, the dragon monster of chaos and evil. The dragon of the Eddas is evil, he is the Midgardswurm that embodies destruction, like the rain-preventing dragon Vritra of the *Rig-Veda*, but beside the latter stands the figure of the 'Dragon of the Deep,' to whom the Vedic Aryan prays as to a beneficent divinity. So Apollo as a healing god is associated with Æsculapius's snake, but destroys the Pytho dragon. Among the Mongoloid Naga tribes, as among the Chinese, the dragon-snake is a world-divinity. Special aspects of snake-worship are the close connection with tree and phallic worship, as found among certain Dravidian tribes, who worship snakes with phallic rites, and the ditch-snake or mound-snake, a symbolic snake among the American wild tribes. Further, and perhaps most fundamental, is to be noticed the close connection between snakes and treasures, which they secrete or guard, as in the case of the Hesperides and many fairy-stories in the West and East. So in Egypt, Osiris in snake-form is associated with wealth, as is the Chaldean Hoā. This trait may be due to the fact that serpents actually hoard jewels and other bright objects. Probably the beauty, poison, and uncanny motion of the snake all combined to make it revered. Under zoölatry must also be noticed the worship of birds, according to more or less definite racial lines of demarcation. Thus the dove is Semitic, and is Greek only as belonging to a Semitic deity; the goose is the most universally revered bird, being worshiped by the Egyptians (sacred to the god Seb), the Japanese, the early Britains, the Romans, and especially by the Dravidians, from the remotest antiquity. Among the Aryans it yielded to the eagle (also the Hittite emblem), but it is still regarded as emblematic of the highest soul in the races to the east of India (Chinese and Japanese), whereas in India itself it has been displaced among the higher classes by the swan. The cock also was widely revered and was sacred to Mars, Æsculapius, Osiris, and to the Hindu battle-god, Kartikeya.

ANTHROPOLATRY. Man is worshiped like other animals. Some forms of anthropolatry, however, represent decadent aspects of theism. Thus in Finland and in Persia the national heroes are

decayed gods, and get a sort of secondary reverence in their new guise. Ordinarily any hero or great man is revered as being more powerful than other men, and in the primitive mind worship and respect are synonymous. So priests are divine and all kings *ipso facto* are divine in India, China, and Japan to-day as they became in Rome, and are said to be among the South Sea Islanders. Sacrifices made to men who have become gods are recognized in the old Hindu law-books. The only rarity in anthropolatry is where the man-god conception embraces former beast-gods and is enlarged to that of an all-god. Thus Krishna in India amalgamates with animal avatars of Vishnu to make an all-god who appears in human or animal form.

ASTROLATRY. This 'worship of the heavenly bodies' is a general term (here including for convenience the worship of heaven itself) for what used to be called Sabaism. Sun and moon gods are not always early divinities. They were unknown, for example, to the older Roman cult, though the Romans worshiped earth and sky. The Aryan Hindu worshiped the sun before he did the moon; the Dravidian feared the sun as a malignant demon; while his Munda neighbor worshiped the same power as a beneficent divinity. The Babylonians perhaps worshiped Sin, the moon, before Bel, the sun; the Hottentots worshiped the moon and not the sun, though they revered Dawn. On the other hand, reversing the Roman order, the Aztecs and American Indians worshiped the sun and not the sky. There is no general principle of progression, such as has often been sought. The stars, again, are in some cases the last of the heavenly bodies to be worshiped; in other cases, a stellar mythology antedates solar or lunar gods. It is especially in connection with star-worship that the wildest theories of mythologists have been evolved. According to some scholars, all Semitic and Aryan mythology reverts to star-worship, and this is supposed to have been the chief religion of the Accadians and Hittites, about whose religion, however, we know in fact very little. It is often claimed that sun-worship is posterior to ghost-worship, and in some cases it is probable that a fully developed sun-worship was superimposed upon a more primitive cult, as among the Aztecs; but the Polynesian sun-light spirit is as antique as any god in the South Pacific, and sun-worship appears not only among the earliest Hindus, but also among the savage Mongoloid Munda tribes. Probably in some races sun-worship was as early as any form of nature-worship, and may be as old as ghost-worship. The beginnings of the worship of heavenly phenomena may be seen even among the Central Australians, who invoke the sun and lightning as living powers. The most remarkable development of sun-worship is to be found among the Mexicans and the Peruvians, where it has eclipsed all other forms; the Babylonians, where the highest gods were identified with the sun and moon; the Dravidians, among whom, as among the related Mongolians, sun-worship is generally found; and the Persians, especially in the Mithraic cult developed out of decadent Zoroastrianism. In Greece sun-worship is represented by Apollo, and in India by Vishnu, but in a rather perfunctory way. Neither of these gods can be said to be worshiped as the sun, though both retain traces of their earlier

conception in the disk symbol and mythological characterization as arrow-shooting, pest-bringing, and yet kindly disposed divinities. The sun is represented in many religions, as in India, under the figure of a bull or horse, or bird, or as riding in a car dragged by seven steeds, or as having rays. Sun and moon are the goal of souls in several religions, such as the Polynesian and Hindu.

All worship of phenomena tends to personification. The question how far the thing and how far the spirit in the thing is worshiped cannot be answered categorically, for the answer depends on time, place, and object. Eventually, as in Greece and Germany, in Zeus and Wodan, the physical background almost vanishes, and only spirits remain, conceived as quite human. Even in the earliest stages of phenomenolatry, there does not appear to be any worship of the object as a physical thing, but only as a spirit-holding or spirit-imbued, i.e. spiritualized object, though in this stage spirit and life may not be distinguished. As to whether man first worshiped major or minor objects of nature, opinion is divided, as it is in regard to animism preceding nature-worship. Generally speaking, English scholars hold to animism as the earliest; German scholars to nature in its grander aspects; and the French to minor nature-worship. From an ethical point of view, it is to be observed that pure nature-worship cannot be sharply sundered from 'ethical religions.' Even taboo (q.v.) is ethical, and lofty ethics is found in connection with purely physical gods. The 'eye of heaven' that marks the sin of man is a natural interpretation of the all-seeing sun as soon as a man evolves ethical ideas and attributes them to his gods.

NAUBERT, nou'hért, FRIEDRICH AUGUST (1839-97). A German composer, born at Schkeuditz, Province of Saxony. He studied at the Stern Conservatorium of Berlin, and became organist and instructor in vocal music in the gymnasium of Neubrandenburg, Mecklenburg-Strelitz. He attained a considerable reputation as a vocal composer of the school of Robert Franz. His publications include soli, duets, trios, quartets, and choral works for four, six, and eight voices.

NAUCK, nouk, AUGUST (1822-92). A German classical scholar. He was born at Auerstedt, and after studying at the University of Halle, taught at several gymnasiums at Berlin until about 1859, when he became member

extraordinary of the Imperial Academy of Sciences at Saint Petersburg. He remained in that city until his death. His best-known works are: *Aristophanis Byzantii Grammatici Alexandrini Fragmenta* (1848); the complete works of Euripides, with the fragments (1854); an annotated edition of Sophocles (*Sophoclis Tragediæ*), based upon Schneidewin (1867); Homer's *Odyssey* (1874) and *Iliad* (1877-79); *Iamblichii de Vita Pythagorica Liber* (1884); select works of Porphyrius, *Porphyrii Philosophi Opuscula Trium* (1860; 2d enlarged ed., *Opuscula Selecta*, 1886); and his greatest work, *Tragicorum Græcorum Fragmenta* (1856; 2d ed. 1889; with the *Tragicæ Dictionis Index*, 1892). The last work is considered the standard edition. Consult Zielinski, *August Nauck* (Berlin, 1894), where his writings are enumerated.

NAUCRATIS (Lat., from Gk. *Ναυκράτις*). An ancient city of Egypt, situated on the Canopic branch of the Nile, near the modern Nebtreh, 53 miles southeast of Alexandria by rail. It was under King Amasis II. the only place in Egypt where Greeks were allowed to settle and trade, and thus became a very flourishing Greek colony. On the successful excavations of Petrie, consult his *Naucratis* (London, 1886-87). Petrie thinks that the Greek settlements at Naucratis may date from as early a period as B.C. 650.

NAUCYDES (Lat., from Gk. *Ναυκύδης*, *Naukydēs*) (called OF ARGOS). A Greek sculptor of the fifth century B.C. He was trained in the manner of Polyclitus I., and was the master of his brother Polyclitus II. A Discobolus, now in the Vatican, is believed to be a copy of a work by him. A gold and ivory Hebe, and statues of Hecate, Hermes, Erinna the poet, and some groups of athletes are mentioned by writers of his time, and later, as works of this sculptor.

NAUDET, nō'dâ', JOSEPH (1786-1878). A French historian, born in Paris. He was made professor of Latin poetry at the College of France in 1821 and was director of the Royal Library from 1840 to 1860. He was also a member of the Academy. His works include: *Histoire de la guerre des esclaves en Sicile* (1807); *Histoire de l'établissement, des progrès et de la décadence de la monarchie des Goths en Italie* (1811); *La conjuration d'Etienne Marcel* (1815); and *De l'administration des postes chez les Romains* (1863).

NAUE, nou'e, JULIUS (1834-). A German painter and archæologist, born at Köthen, Anhalt. He studied in Nuremberg and in Munich (1861-66). His best-known works include: "The Fairy-tale of Emperor Henry I. and Princess Ilse" (1865-67), in water colors; "Germania," "Roma," and six other great frescoes (1868), for a villa near Lindau; "The Myth of Prometheus" (1872-73), in water colors; "The Fate of the Gods" (1875-77), cycle in fresco; and seven paintings in tempera from the epic "Helgi and Sigrun" (1879). Subsequently he took up the study of Bavaria's prehistoric period, made numerous excavations of mounds, and published *Die prähistorischen Schwerter* (1885); *Die Hügelgräber zwischen Ammer- und Staffelsee* (1887); and *Die Bronzezeit in Oberbayern* (1894).

NAUGATUCK, nā'gā-tŭk. A town and borough (coextensive) in New Haven County, Conn.,

17 miles northwest of New Haven; on the Naugatuck River, and on the Naugatuck Division of the New York, New Haven and Hartford Railroad (Map: Connecticut, C 4). It has the Whittemore Memorial Library, Salem School, Whittemore High School, and noteworthy business blocks, and is engaged extensively in manufacturing india-rubber goods, knit underwear, malleable iron, and paper boxes. Naugatuck was first incorporated in 1844 as a town, and in 1893 as a borough; consolidation was effected in 1895. The government, under the charters of 1893 and 1895, is administered by a board of warden and burgesses, annually elected, which has powers of appointment in all borough offices excepting the board of education, chosen by popular vote. Population, in 1890, 6218; in 1900, 10,541.

NAUHEIM, nou'hīm. A noted watering-place in the Grand Duchy of Hesse, Germany, on the Usa, 17 miles north of Frankfort (Map: Germany, C 3). The Kurhaus is surrounded by beautiful grounds. The waters, ranging in temperature from 86° to 95° F. and containing salt, iron, and carbonic acid, are used for both drinking and bathing, and are especially efficacious in cases of intestinal and cutaneous diseases, gout, rheumatism, and heart diseases. Considerable quantities of water and salt are exported. The place is visited annually by about 6000 patients. Population, in 1900, 4505.

NAULETTE, nò'lèt'. A cavern on the Lesse in the Commune of Furfuz, near Dinant, Belgium. Here, in 1866, Dupont found a human lower jaw associated with bones of the elephant and rhinoceros. The Naulette man is now assigned to the Mousterian epoch (q.v.). Consult Mortillet, *Le préhistorique* (Paris, 1900).

NAUMACHIA, na-mă'ki-ă (Lat., from Gk. *ναυμαχία*, naval battle, from *ναῦς*, *naus*, ship + *μάχεσθαι*, *machesthai*, to fight). Among the Romans, a mock naval battle; also, the place used for this purpose. Julius Cæsar was the first to introduce a naumachia into Rome (B.C. 46), causing a portion of the Campus Martius to be transformed into a lake, on which the spectacle came off. Augustus made an artificial lake (*stagnum*) near the Tiber for the same purpose, which was afterwards frequently used for naumachiæ. Claudius also gave an exhibition of the kind on Lake Fucinus, in which nineteen thousand combatants took part. These naumachiæ were not sham fights, any more than ordinary gladiatorial combats. Both sides fought in real earnest until one was utterly overpowered. The crews consisted of gladiators, prisoners, or condemned criminals.

NAUMANN, nou'mân, JOHANN FRIEDRICH (1780-1857). An eminent German ornithologist. He was born at Ziebigk, worked on a farm with his father, a skilled ornithologist, and became inspector of the ornithological museum of the Duke of Anhalt-Köthen. He was a clever draughtsman and himself engraved the plates for the illustrations of his *Naturgeschichte der Vögel Deutschlands* (12 vols., 1822-44), a standard work. Naumann wrote, besides: *Taschermie* (1815; 2d ed. 1848); *Ueber den Haushalt der nördlichen Seevögel Europas* (1824); and, with Buhle, *Die Eier der Vögel Deutschlands* (1819-28). In his honor, the German Ornithological Society named its journal *Naumannia*.

NAUMANN. A family of German musicians. **JOHANN GOTTLIEB** (1741-1801), the most important member, was born at Blasewitz, near Dresden. He studied under Tartini, Padre Martini, and others, and became Court composer at Dresden in 1764. In 1766 he was appointed kapellmeister at Dresden. He produced many operas, and in 1777 organized the royal orchestra of Stockholm, Sweden. He made several tours throughout Italy and Prussia and was regarded as one of the most important composers of his time. He wrote over 20 operas, 10 oratorios, 18 symphonies, and numerous smaller works, instrumental and vocal. Consult: Meissner, *Bruchstücke aus Naumanns Lebensgeschichte* (Prague, 1803-04).—His grandson, **EMIL** (1827-88), studied under Von Wartensee and Mendelssohn, and at the Leipzig Conservatory. He was chiefly famous for his valuable and scholarly writings, particularly with reference to church music; and was also the composer of an oratorio *Christus der Friedensbote* (1848), and the opera *Judith* (1848). Among his more important works are *Die Tonkunst in der Kulturgeschichte* (Berlin, 1869-70) and *Musikdrama oder Oper* (1876). He lectured on musical history at the conservatory at Dresden.—**KARL ERNST** (1832—), another grandson of Johann Gottlieb, became favorably known for his writings and compositions. He was born in Freiberg, Saxony, and received his musical education in Leipzig, completing his musical studies with a two years' period of organ study under Schneider of Dresden. His compositions are principally chamber music, and so far as is known he may be said to have written the first sonata for viola and pianoforte.

NAUMANN, KARL FRIEDRICH (1797-1873). A German mineralogist, born in Dresden. He studied at the Freiberg School of Mines, and at the universities of Jena and Leipzig, and in 1821 made a journey to Norway for scientific purposes. After his return he became an instructor at Jena. A year later he was called to Leipzig as professor, and in 1826 he accepted a similar position at Freiberg, but in 1842 he returned to Leipzig, where he remained until his retirement, thirty years later. Among his writings are: *Anfangsgründe der Kristallographie* (2d ed. 1854); *Elemente der theoretischen Kristallographie* (1856); and *Elemente der Mineralogie* (12th ed. 1885).

NAUMBURG, noum'bōrk, or NAUMBURG-ON-THE-SAALE. The capital of a circle in the Province of Saxony, Prussia, situated on the Saale, 30 miles southwest of Leipzig (Map: Prussia, D 3). Its cathedral of Saints Peter and Paul is an interesting building with four towers and many statues, paintings, monuments, and other specimens of early German art. There are a gymnasium and a Realschule. The town manufactures woollens, soap, leather, combs, and sausages. Glass and porcelain painting is also an important industry. The trade in wine is extensive. In 1029 Naumburg became the seat of the bishopric of Naumburg-Zeitz. Population, in 1900, 23,187.

NAUPLIA, na'plē-ă. A town of Greece, the capital of the Nomarchy of Argolis, seven miles southeast of Argos, on the Argolic Gulf (Map: Greece, D 4). It has railroad connection with Corinth. The impregnable situation of its harbor, protected by strong fortresses, renders it of

great strategic importance. The Palamidi, a fortification originally constructed by the Turks and later strengthened by the Venetians, is at present utilized as a prison. Owing to its advantageous situation and spacious harbor, Nauplia is of some prominence commercially. From 1824 to 1834 it was the capital of Greece. In mediæval times Nauplia was one of the leading cities of the Peloponnesus. Here in 1831 Capo d'Istria, the President of the Republic, was assassinated. Population of commune, in 1889, 10,879.

NAUPLIUS (Lat., sort of shell-fish, which sailed in its shell as in a ship, from Gk. *ναῦς*, *naus*, ship + *πλεῖν*, *plein*, to sail). A larval stage in the development of certain crustaceans. See **METAMORPHOSIS**; and **PLATE OF BARNACLES**.

NAUSEA (Lat., from Gk. *ναῦα*, *nausia*, seasickness, disgust, nausea, from *ναῦς*, *naus*, ship). A distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach. Among the more common causes of nausea (which may or may not be followed by vomiting) may be mentioned fainting spells, the taking of a general anæsthetic, and surgical shock. It may be provoked by blows upon the head, abdomen, testicles, or ovaries, or by powerful mental impressions such as revolting sights, odors, or sounds, and sudden fright. Other causes are discussed under **VOMITING**.

NAUSHON, ng'shōn'. One of the Elizabeth Islands (q.v.).

NAUSIC'AA (Lat., from Gk. *Ναυκίδα*, *Nau-sikaa*). In the *Odyssey*, the daughter of the Phæacian King Alcinoüs. When Odysseus is wrecked on the coast of Scheria, she discovers him and conducts him to her father's court.

NAUTCH, nāch (Hind. *nāch*, from Skt. *nāṭya*, dance, from *nart*, to dance). The term applied especially in Northern India to the dancing girls attached to the temples. The corresponding word in the south of India is *bayadere* (q.v.). The presence of these girls at temples and their double rôle of attendants on the deity and of courtesans is undoubtedly a survival of the custom formerly widespread, especially in the East, of sacred prostitution. The daughters of nautch girls are generally trained as successors of their mothers. As in like religious customs elsewhere, no social odium attaches to these women. The nautch dancers are completely enveloped in winding drapery, and move with slow and rhythmic motions of the body, while the hands are busied in graceful gesturing and in managing the drapery. The feet are little used. The nautch dance is primarily erotic in character, and now is often regarded by the natives as symbolizing the loves

of Krishna (q.v.) and the milk-maids. See **BAYADERE**; **DANCING GIRLS**.

NAUTICAL ALMANAC (from Lat. *nauticus*, from Gk. *ναυτικός*, *nautikos*, pertaining to ships or sailors, from *ναῦς*, *nautes*, sailor, from *ναῦς*, *naus*, Skt. *nāu*, ship). A volume issued annually, and containing primarily the astronomical data required by navigators in the computation or reduction of the sextant observations by which the ship's position at sea is ascertained. The preparation and publication of these almanacs is very costly, and is therefore undertaken as a work of public utility by several different governments. Thus the United States issues the *American Ephemeris and Nautical Almanac*; Germany, the *Berliner Astronomisches Jahrbuch*; France, the *Connaissance des temps*; and Great Britain, the *Nautical Almanac*. To the astronomer, the *Nautical Almanac* furnishes a great mass of important data; it gives the position of the moon in right ascension and declination for every hour, and the sun's latitude and longitude for every day in the year; it shows the obliquity of the ecliptic, the sun's and moon's parallax, aberration, etc., at different times; it supplies the necessary data for the determination of the real or apparent size, position, and motion of the planets and their satellites; it fixes accurately the places of the more important stars, and gives full details concerning eclipses, occultations, transits, and other celestial phenomena occurring during the year. It is generally issued two or three years in advance of its date for the sake of mariners going on long voyages. See **ALMANAC**.

NAUTICAL SCHOOLS. See **NAVAL SCHOOLS OF INSTRUCTION**.

NAUTICAL SURVEYING. See **HYDROGRAPHY**.

NAUTILOIDEA (Neo-Lat., from Lat. *nautilus*, from Gk. *ναυτίλος*, sailor, *nautilus*, from *ναῦς*, *naus*, ship + *εἶδος*, *eidōs*, form). An order of fossil Cephalopoda, equal in rank to the Ammonoidea, containing about 2500 species that range from Cambrian to recent time, and are represented at present by only two or three living species of the genus *Nautilus*. The most ancient forms were straight conic shells (Orthoceras) which soon became coiled like the modern forms. Many of the extinct genera and species are most important horizon-markers or index fossils. See **CEPHALOPODA**; **NAUTILUS**; **ORTHO CERAS**.

NAUTILUS (Lat., from Gk. *ναυτίλος*, *nautilus*, sailor, from *ναῦς*, *naus*, ship). The pearly nautilus (genus *Nautilus*) is the only living representative of an immense assemblage of shelled cephalopods of the subclass Tetrabranchiata, which flourished during past geological ages. The shell is coiled in one plane, divided into chambers by partitions or septa, the outermost being called the 'living chamber,' as it contains the animal; the septa are perforated by the siphuncle, which is central or nearly so, and the aperture is wide and spacious. The shell consists of two layers, the outer being porcellaneous, the inner pearly, or nacreous, whence the name 'pearly' nautilus. The initial chamber consists of an obtuse incurved cone, marked on the outer surface of its posterior wall by a small scar called the *cicatrix*. It is supposed that a perishable embryonic shell (protoconch) was formed, the presence of which is indicated by the *cicatrix*.

The body is short and thick, divided into a large obtusely conical head bearing eyes, tentacles, ears (otocysts), and a rounded sac-like trunk. The mouth is surrounded by about 90 external filiform tentacles. The pair of tentacles on the inner or dorsal side are fused so as to form a hood-like lobe by which the aperture of the shell is closed when the animal is withdrawn into the

PEARLY NAUTILUS (*Nautilus pompilius*).

Seen in section showing the chambers and siphuncle. (Half natural size.)

living chamber. Beneath is the funnel (hypopharynx), not forming a completely closed tube as in the squids, but a locomotive organ, through which, as in other cephalopods, the water is ejected with sufficient force to throw the animal backward. In swimming forward, says Kent, the tentacles are extended radially from the head.

The mouth is in the centre of the lobes and groups of tentacles, armed with a tongue (radula) and a pair of remarkably powerful horny jaws tipped with carbonate of lime. Olfactory organs and osphradia are present. The animal is attached within the living chamber by two oval muscles. The compartments of the shell are usually said to be filled with air or gas, but according to Verrill they are filled with seawater, which may be taken in or expelled so as to equalize pressure at varying depths.

Until recently the living nautilus was exceedingly rare, though the empty shells are cast ashore in great quantities in the Pacific and Indian oceans. Yet they have been for a long time trapped in baskets like lobster-traps by the natives of some of the Melanesian and Fiji islands and used as food. Willey at Ralum, in New Britain, succeeded in trapping the nautilus in 70 fathoms of water. He also succeeded at Lifu, one of the Loyalty Islands, in capturing specimens at a depth of only three fathoms. These he kept in a large submerged cage, feeding them daily until his efforts were rewarded early in December, 1894, by finding that they had spawned in the cage, yielding an abundance of eggs. These are not laid in bunches, as is the case with those of the squid, but are deposited separately by the female. Each egg is as large as a grape. There are said to be three species now living in the Pacific Ocean, while the number has been carried up to even four. The two better known species are *Nautilus pompilius* and *Nautilus umbilicatus*.

FOSSIL NAUTILI. Although the family Nautilidae dates from the Jurassic period, the genus *Nautilus* is doubtfully referred to the Tertiary. The order Nautiloidea, however, originated as early as the Ordovician; the earlier types were straight and uncoiled, like *Orthoceras*. Very striking, says Hyatt, is the marvelously sudden rise of the Nautiloidea as a group; it reached its maximum in the Silurian, followed by a decline extending from the Devonian to the Triassic period. Then the forces acting unfavorably upon their existence were arrested, or their violence lessened, and the group has been affected by only very slight changes and an exceedingly slow process of retrogression, until the present time.

NAUVOO, ng-voo'. A city in Hancock County, Ill., 12 miles north of Keokuk, Iowa; on the Mississippi River, at the head of the lower rapids (Map: Illinois, A 3). It is in a highly productive fruit-growing country, where the leading occupations are wine-making and the culture and shipment of fruit for market, particularly grapes and berries. Saint Mary Academy, conducted by the Benedictine Sisters, is in Nauvoo. The most interesting features in this vicinity are the remains of the old Mormon buildings. Population, in 1890, 1208; in 1900, 1321. Nauvoo was founded by the Mormons in 1840, and rapidly increased in size until in 1846 it had a population of 15,000. In this year the settlement was broken up by the people in the neighborhood. (See **MORMONS**.) An imposing temple, 130 feet long by 90 feet wide, left unfinished by the Mormons, was destroyed partly by fire in 1848 and partly by a tornado in 1850. In 1850 a company of French socialists, called Icarians (q.v.), under the leadership of M. Cabet, occupied Nauvoo, but their experiment proved a failure, and they abandoned the place in 1857.

NAVA, ná-vá. A seaport of Japan. See **NAFA**.

NAV'AHÓ, or **NAV'AJÓ**, *Sp. pron.* ná-vil'hó. An important tribe of Athapascan stock (q.v.). Their present reservation in northeastern Arizona and extending into New Mexico and Utah comprises nearly ten million acres, but it is almost entirely an arid desert of sand and rock, unfit for any purpose except scanty grazing. Like other tribes of the same stock, they call themselves simply *Diné*, 'people'; they are called *Apaches de Navajo* in Spanish records at least as early as 1630. They came originally from the far northern home of their kindred, but have incorporated elements from all the neighboring tribes. They were roving and predatory in their habits, and were continually at war with the Ute and the Plains tribes. They were alternately at war or peace with the Spaniards during the early

colonization period, but later became so troublesome that in 1705 and again in 1713 it was necessary to bring them to terms by vigorous invasions of their country. In 1744 Franciscan missionaries attempted to civilize them, but in a few years the effort was abandoned. In 1805, in consequence of continued raids, a Spanish force penetrated their stronghold in Tseyi (Chelly) Cañon and inflicted a severe defeat, killing 115 men, women, and children. The lesson, however, was soon forgotten, and between the fall of the Spanish power about 1815 and the American occupation of the country thirty years later they made the stealing of sheep, cattle, and horses from the Mexican settlements a steady and profitable business. With their booty they were enabled to become a pastoral tribe, and they adopted from the more civilized Pueblos a well-developed weaving art. From the Mexicans they learned the simpler forms of metal-working, especially in silver. In 1846 a number of prominent chiefs made their first treaty with the American Government, but, on account of the unfortunate killing of the principal signer three years later, the tribe again became hostile. Hostilities continued with but short intermissions until 1863, when it was determined to deport the entire tribe to the Bosque Redondo reservation on the Pecos River, near Fort Sumner, in eastern New Mexico. In the ensuing winter a mixed force of whites and Ute Indians under Kit Carson invaded the Navaho country and forced their cañon stronghold. Within a year nearly 8500 had been deported to the Bosque Redondo, and it was supposed that not more than 2000 remained at large in their own country, but later developments proved that not more than half, and these not the most troublesome, had been removed. The experiment proved a failure. The stock of the Navaho died or was stolen, their crops failed, and their numbers decreased from disease, escapes, and attacks by the Plains tribes. In June, 1868, a new treaty was made, under which the captives, then numbering 7300, were returned to a reservation set aside in their old country, and were given sheep and cattle with which to begin life anew. Since then they have remained quiet, steadily increasing in wealth and population. In 1884 the reservation was extended to its present dimensions to accommodate their rapidly increasing herds.

The Navaho have a fully developed clan system, including some fifty clans, with descent in the female line. Their government is democratic and local, rather than centralized, since the nature of their country and occupation prevents the formation of large organized bodies, so that each family shifts for itself in the search for temporary pasturage and water supply. They are agricultural to a limited extent. They make some pottery and baskets, but derive their main subsistence from their herds of sheep and goats, together with horses and some cattle. They are well known for the beautiful and durable blankets which they weave from the wool of their flocks, and for their artistic silver ornaments. Although, like most pastoral peoples, they are nomadic, they build at each regular halting place permanent *hogáns*, or circular houses, of logs covered with earth, with a short covered entranceway and smoke-hole at the top. Men and women alike are almost constantly at work caring for their herds, weaving, or laboring at the forge. They have elaborate and

spectacular ritual ceremonies and an abundant mythology, with hundreds of sacred songs in the keeping of their priests. Aside from the industries which they have made their own they have adopted but little of the white man's civilization or teaching. They are estimated now at 20,000, less than half of whom are within the reservation limits, the rest ranging on outside pastures or working in the white settlements. Consult Matthews, *Navaho Legends* (Boston, 1897). See Colored Plate of INDIANS.

NAVAHO BLANKETS. See BLANKET, with Colored Plate.

NAVAL ACADEMY, UNITED STATES. The school at which are educated the executive officers of the United States Navy. It was founded as the 'Naval School' in 1845, at Annapolis, Md., with a course fixed at five years, the first and last of which were to be spent at the school; but this plan was not strictly adhered to even at first, and was subsequently changed. In 1849 the course was changed to seven years, the first two and last two being spent at the school, and the three intervening years at sea, and the name of the institution was changed to United States Naval Academy. In 1851 the four years of study were made consecutive, and annual practice cruises were commenced. In 1861 the academy was removed to Newport, R. I., on account of the war. It returned to Annapolis in 1865.

In 1873 the course for cadet midshipmen was extended to six years, the last two to be spent at sea. In 1882 the title of cadet midshipman was changed to naval cadet, which in 1902 was replaced by that of midshipman. Appointments to the different corps were made by the Secretary of the Navy upon recommendation of the academic board; but only enough appointments were made to fill vacancies, all other graduates being honorably discharged. In 1889 the law provided that the cadets of the first class (seniors) should be separated at the beginning of the year into two divisions, and those destined for the line and the engineer corps should pursue separate courses of study during the first class year. In 1889, also, the age of candidates at date of admission, which had been from fourteen to eighteen years, was changed to fifteen to twenty years. In 1899 the act of March 3d consolidating the engineer corps with the line abolished the separate line and engineer divisions at the Academy. The same act increased slightly the numbers in all grades of the service and very much increased the lower grades. The number of graduates thus became insufficient, and in 1900 the number of cadets at the Academy was increased by an act authorizing appointments to the Academy every four years instead of every six. The number of officers in service subsequent to the Spanish-American War was wholly inadequate to the increasing demands of the fleet, and as the only means of adding to the number is through the Naval Academy, an increase in the number of cadets was proposed. This increase, made by Congress in 1902, provided for the appointment of a cadet every two years by each Senator, Congressman, and Delegate in Congress, and 11 by the President.

The course of study and instruction at the institution is much more advanced than the term Academy would imply, and approximates that of many post-graduate technical schools. The course for the first year (fourth class) includes

mechanical drawing, algebra, geometry, descriptive geometry, trigonometry, English studies, French, Spanish, and hygiene, and practical exercises and instruction in seamanship, boats, ordnance, target practice, infantry, artillery, battery drill, fencing, gymnastics, dancing, and swimming. The course for the second year (third class) includes trigonometry, conic sections, differential and integral calculus, mechanical drawing, physics, chemistry, naval history, French and Spanish, and practical exercises and instruction in seamanship, boats, signals, ordnance, target practice, infantry, artillery, battery drill, fencing, and steam engineering. The course for the third year (second class) includes seamanship, principles of mechanism, mechanical processes, mechanical drawing, marine engines and boilers, integral calculus and mechanics, physics, chemistry, and electricity, and practical exercises and instruction in seamanship, boats, steam tactics, signals, ordnance, infantry, artillery, battery drill, target practice, fencing, and steam engineering. The course for the fourth year (first class) includes seamanship and naval tactics, gun and torpedo drills, naval ordnance and gunnery, navigation, theory of compass deviations, marine surveying, boilers, naval construction, engineering materials and designing, physics, electricity, and Spanish, and practical exercises and instruction in seamanship, boats, steam tactics, battery drill, target practice, torpedo practice, ordnance, artillery, infantry, fencing, compass correction, navigation, surveying, steam engineering, practical electricity, turret drill, etc.

From the first of June until the first of September the cadets are embarked on practice vessels for the summer cruise, when they are instructed practically in the various duties of their profession. For several years since the Spanish-American War one of the practice vessels has been a battleship temporarily detached from the fleet, the upper classes spending half the summer on her and half on the sailing training-ship *Chesapeake*. Until 1898 most of the buildings of the Academy were very old, many of them dating from the early part of the nineteenth century, and the accommodations for the cadets inadequate as well as unsuitable. The necessary expansion of the institution was brought to the attention of Congress by the war, and a very liberal plan of rebuilding the Academy was adopted. The expenditure authorized was \$8,000,000, and the result will be the finest naval institution of learning in the world. About one-half the buildings were under construction in 1902. Consult: Soley, *History of the Naval Academy* (Washington, 1876); Benjamin, *The United States Naval Academy* (New York, 1900).

NAVAL APPRENTICE. See section on *Naval Apprentice*, under **APPRENTICE**.

NAVAL ARCHITECTS AND MARINE ENGINEERS, THE SOCIETY OF. An association incorporated under the laws of New York State, with headquarters in New York City. The object of the association is the promotion of the art of shipbuilding. The society holds annual meetings, and has a membership of over five hundred.

NAVAL ARCHITECTURE. See **SHIPBUILDING**.

NAVAL CADET. See **CADET, NAVAL**.

NAVAL CONSTRUCTORS. Officers of the United States Navy charged with the design,

building, and repair of ships. The corps of naval constructors is filled by appointment of graduates of the Naval Academy who are sent (after graduation) to special technical schools for an additional course in shipbuilding. In 1902 there were twenty-one naval constructors and twenty assistant constructors. The constructors are not allowed a free hand in designs, as the general features are prescribed by the Secretary of the Navy upon the recommendation of the Construction Board, which consists of the chiefs of the bureaus of the Navy Department. The working out of the design, however, is left wholly to the construction corps.

NAVAL CROWN. In heraldry, a rim of gold around which are placed alternately prows of galleys and square sails.

NAVAL INSTITUTE, UNITED STATES. An organization founded at Annapolis in 1873 by the officers then on duty at the United States Naval Academy. It has for its object the promulgation of knowledge concerning naval affairs among the officers of the naval service. During the first years of its existence it issued occasional numbers of its *Proceedings*, but in a short time the publication was made quarterly, and this has since continued. In addition to papers submitted by officers, the *Proceedings* contain a quarterly review of the naval work of the world in the "Professional Notes," which aim to give all available information concerning new ships, guns, torpedoes, etc., which has become available during the past quarter. Each year the Institute offers a gold medal, a life membership, and a prize of \$100 for the best essay on any subject of interest to the service, reserving the right to withhold the offer if no worthy essay is presented.

All officers of the Navy and persons holding positions under the Navy Department are eligible to membership, and other persons interested in naval affairs may be elected as associate or honorary members. The present membership of the Institute includes about two-thirds of all the officers in the navy and is rapidly increasing.

NAVAL LAW. See **MILITARY LAW**.

NAVAL OBSERVATORY. A Government institution situated at Washington, D. C., a division of the Bureau of Equipment in the Navy Department. Its functions are "to determine accurately the positions of the sun, moon, planets, and stars for use in preparing the *Nautical Almanac*; to test chronometers; to issue correct standard time daily; . . . to distribute to vessels of the Navy instruments of precision for navigating purposes; to conduct astronomical investigations of general and special scientific interest; and, since 1894, to publish the *Nautical Almanac*." It had its origin in a depot of charts and instruments established by the Navy Department under the charge of Lieut. L. M. Goldsborough in 1830. At this depot, "in a small circular building, on a brick pier with a foundation 20 feet below the surface, he mounted a 3-inch transit instrument made by R. Patten of New York City." In 1833 Lieutenant Wilkes, U. S. N., moved the depot to another site on Capitol Hill, and at his own expense built an observatory containing a transit instrument of 3¾ inches aperture and 63 inches focal length; a Borda's circle; a 3¼-foot achromatic portable telescope; a portable transit instrument; and a sidereal clock. In the summer of 1838 the Secretary of the Navy

directed the superintendent "to make a constant series of observations in astronomy, magnetism, and meteorology, ordering an additional number of assistants (naval officers), and granting authority for the purchase of all necessary instruments." Under these instructions Lieut. J. M. Gilliss, U. S. N., began systematic observations in astronomy with additional instruments as follows: A sidereal clock and a mean time clock; a meridian circle of 5.5 inches aperture furnished with circles 30 inches in diameter; a portable achromatic telescope of $3\frac{1}{4}$ inches aperture and 42 inches focal length. The work done under his direction at the Capitol Hill depot between 1838 and 1842 was published in 1846 as *Astronomical Observations Made at the Naval Observatory*, being the first American volume of this nature.

A building for this depot was authorized by Congress in 1842 through the efforts of Lieutenant Gilliss. Taking the report of the Naval Committee which accompanied the bill as the exponent of the will of Congress, he, after consulting American and European scientists, prepared plans and erected the Naval Observatory. Soon after the instruments were in place Lieut. M. F. Maury succeeded to the charge of the observatory, remaining as superintendent until 1861, and in addition to astronomical work devoted much of his personal attention to the study of ocean currents and other hydrographic and nautical subjects, which gave him international reputation. He was followed as superintendent by such men as Gilliss, Davis, and Rodgers. Among the earliest of the scientific achievements of the new observatory were the observations of Neptune secured in 1846 immediately after the discovery of that planet, which enabled Sears C. Walker, by identifying two older foreign observations, to discuss the elements of Neptune during his short connection with the Observatory. The adaptation of electricity to record observations by Prof. John Locke, formerly lieutenant in the Navy, resulted in the installation of the first practical chronograph at the Observatory in 1849. With the 9.6-inch equatorial Assistant Astronomer James Ferguson discovered several planetoids between 1854 and 1860. The 26-inch lens made by Alvan Clark, at the time the largest refracting telescope in the world, enabled Prof. Asaph Hall to discover the satellites of Mars in 1877. In 1893 new buildings were completed on a more favorable site on Georgetown Heights, comprising a commodious office building occupied by the offices of the astronomical, nautical instrument, time service, and *Nautical Almanac* departments, while the 26-inch equatorial, a 9-inch and a 6-inch transit circle, and a 5-inch prime vertical instrument are disposed in suitable dome and houses on the south, east, west, and north of a clock-house, the longitude of which is 5h. 8m. 15.78s. W., and the latitude $38^{\circ} 55' 14.0''$ N. In addition to the instruments named there are a 12-inch equatorial, a 6-inch altazimuth, a 5-inch transit, a 5-inch photoheliograph, and numerous others. The library contains about twenty thousand volumes, and is the most complete astronomical collection in the country. The publications of the Observatory comprise more than fifty large quarto volumes, which contain full details of the work executed, with many valuable scientific memoirs by Professors Asaph Hall, Simon Newcomb, William Harkness, and others.

NAVAL ORDER OF THE UNITED STATES. An hereditary patriotic society organized in Boston, Mass., on November 10, 1890, having for its objects the perpetuation of the deeds of the American Navy through the encouragement of research in naval arts and science and the preservation of historic memorials relating to the Navy of the United States. There are two classes of companions. The first class includes veteran officers and their male descendants; and the second class, enlisted men who have received the United States naval medal for bravery in the face of the enemy. The badge of the order is a gold Maltese cross coated with blue enamel and edged with gold. In the centre of the obverse is the insignia of the Navy of the United States with the motto, 'Fidelitas et Patria'; on the reverse is the insignia of the Marine Corps. There are State commanderies in Massachusetts, Pennsylvania, New York, California, Illinois, and the District of Columbia. Representatives from these commanderies meet triennially as a general commandery. The total membership is about 500.

NAVAL RESERVE. In all the more important navies, in addition to the regular forces serving continuously with the fleet, there are certain others which are drilled and instructed in order to be able to supplement the personnel of the fleet in time of war. In peace these men are largely employed in the merchant marine, in yachts, in auxiliary Government services, or are pensioners or others who have served the requisite length of time for pension or discharge, but are still within the limit of age. In some countries a portion of the naval reserves have not served either in the mercantile marine or the navy, but receive a certain amount of training for such service; while in countries in which service in the army and navy is compulsory the greater part of the reserve is made up of men who have completed the requisite length of active service with the fleet.

The naval reserve of the United States is small (about 4000 officers and men) and consists of battalions or divisions of State naval militia organized at various ports on the seacoast or the Great Lakes. These officers and men served in the war with Spain, and, considering their opportunities for training, they acquitted themselves with great credit and were a most important addition to the strength of the navy personnel. The defects of the system of training and organization were, however, so clearly shown that the establishment of a national naval reserve under the direct control of the Navy Department has been under continuous consideration and is likely to be effected, especially as the number of men likely to be obtained from the naval militia is inadequate to the demands of a strong war fleet.

In Great Britain the naval reserve consists of (1) the royal naval reserve, (2) the royal fleet reserve, and (3) the pensioners. On January 1, 1903, the total of these three classes was 41,540 men; in addition, there were 4200 men in the coast-guard, who are included in the regular effective force of the navy, but are employed in coast-guard duties. The reserves are drilled on board special drill ships, on board vessels of the regular fleet, at various barracks, etc. They receive a small retaining pay and full pay when actually serving. The reserve of the French and

German navies are derived chiefly from honorably discharged men who have served the required term of enlistment and then pass into the reserve. To these may be added the men who have not yet been called upon, but who will be required to serve in time of war, such as fishermen, merchant sailors, and others pursuing such callings as are useful in the war fleet, also those who may elect to serve in the navy rather than the army. On January 1, 1903, the effectives of the French reserve were about 50,000 in number, and of the German about 74,000. The Russian naval reserve is somewhat similarly derived, but contains a greater proportion of untrained men who are unfamiliar with nautical life. Its numbers are not definitely known and the requirements of entry are being changed; a fair estimate is 60,000—of which not more than half have received much training. The Italian reserve, like those of France and Germany, consists of men who have completed the term of active service and have passed to the reserve list. The number has at times exceeded 32,000 and is now probably not less than that. See NAVIES.

NAVAL SCHOOLS OF INSTRUCTION.

In the United States the naval schools consist of the Naval Academy (q.v.), Naval War College, Naval Torpedo School, apprentice training schools, and gunnery training schools. The Naval War College is at Newport, R. I., and performs the double function of preparing plans of naval operations and instructing officers in special lines. The torpedo school for both officers and men is located at the Torpedo Station on Goat Island, Newport Harbor, R. I. The principal training station for enlisted men is the one for apprentices at Newport; but there are others at Port Royal, S. C., and San Francisco. The school for seamen gunners is divided between the naval gun factory at Washington and the torpedo station at Newport. Gun captains are trained on the gunnery training ships, which usually have headquarters at Port Royal, S. C.

FOREIGN NAVAL SCHOOLS. The naval school of *Argentina* is at Buenos Ayres. The age at date of admission is fourteen to seventeen years and the course is four years. The instruction is very good in theoretical branches, but the practical nautical exercises are very few.

The greater part of the executive officers of the *Austro-Hungarian* navy are graduates of the naval academy at Fiume; the others are appointed provisionally and serve in the fleet until able to pass a satisfactory examination. The age at date of admission to the academy is fourteen to sixteen years. The course is four years, three months of every year being spent on board a practice ship. There are also gunnery training schools, torpedo schools, and sailing training vessels for men and boys.

The executive officers of the *Brazilian* navy are recruited from the graduates of the naval school at Rio de Janeiro. The limits of age at entrance to the academy are thirteen and seventeen years and the course is three years. The graduates are transferred to the naval college (Rio de Janeiro) for an additional course of four years.

There is a naval academy for the education of officers of the *Chilean* navy at Valparaiso. The course is six years, previous to which the cadet must have completed three years at the military academy at Santiago.

There is a naval school for the instruction of

officers in the *Chinese* navy at Nanking, but only a part of the officers are educated there. It may be said that in the appointment of officers, as in everything connected with the navy, there is no system. The course at the academy is four to six years.

In *Denmark*, each year there are ten admissions to the naval school for officers, situated at Copenhagen. The candidates must be from fifteen to twenty years of age and have served nine months in the navy or eighteen months in the merchant marine. After a preliminary cruise of three months they are reexamined and six of the ten selected, the others being discharged. The course of instruction is four years.

The training of officers and men for the *French* navy is undergoing some changes. The principal naval schools are the Polytechnic School (partly naval), Naval School, superior training school for executive officers, training school for engineer officers, medical, torpedo, machinist, gunnery, and ordnance schools. The naval school proper is on the old line-of-battle ship *Borda* at Brest. The requirements for entrance are high, and the range of subjects quite wide. The age at entrance is from fourteen to eighteen years. The course is two years. After completing the course at the naval school the cadets are promoted to *aspirants* second class, and sent on board a cruising training ship where their instruction is continued for a year. They are then promoted to *aspirants* first class and their training ceases. The school for engineers is a school of engine design and construction. The medical schools are three in number and are located at Brest, Rochefort, and Toulon. The course of study is two years. The torpedo, gunnery, and ordnance schools are for the practical and theoretical education of those officers who incline to become specialists. The machinist school is for the training of warrant and petty officers of this branch for higher grades.

The *German* naval academy is located at Kiel. The candidates for admission must not be more than seventeen years old and must possess certificates of qualification for the upper classes of a royal high school (*Realgymnasium*), or pass an examination in the equivalent subjects. After entering they receive four weeks' practical instruction on shore; the cadets are then sent on board a cadet training ship and pass the winter abroad. Upon their return in the spring they are examined and, if qualified, promoted to ensign (*Fähnrich zur See*). They are then embarked for another full year's course of practical training and theoretical and practical instruction on one of the cadets' and boys' training ships. The young ensigns are then transferred to the naval academy for one year's course of theoretical instruction. At the close of the year the principal examination takes place; after which the ensigns are sent for half a year to the gunnery and torpedo ships and to the marine infantry school for special practical and theoretical courses in gunnery, torpedo, and infantry instruction. After this they are examined, and upon passing are sent for two years' practical training on board battleships or large cruisers; but they are promoted to lieutenant (*Lieutenant zur See*) at the end of the first year.

The naval school of the *British* navy is located at Dartmouth on board the old line-of-battle ships *Britannia* and *Hindustan*, though academic buildings on shore were commenced in 1902. The

course is two years and includes instruction in seamanship, navigation, mathematics, and technical subjects. On completing the *Britannia* course the cadets or midshipmen are appointed to sea-going ships carrying a naval instructor who, in conjunction with an officer of the line and an engineer, supervises their instruction. After passing the necessary examinations and completing the required amount (about five years, including time spent on the *Britannia*) of sea service the midshipmen undergo an oral examination in seamanship carried out by three captains. Upon passing this they undergo a college examination at Greenwich, receiving certificates of the first, second, or third class, according to qualifications. This certificate materially affects promotion to lieutenant. After leaving the college the acting sublieutenants go through courses in pilotage, gunnery, and torpedo instruction. The men of the Royal Naval Reserve are drilled on board widely distributed ships for the greater convenience of the merchant sailors who form the principal part of the reserve. The training of firemen, machinists, etc., is carried out on vessels attached to the different dockyards.

The *Italian* naval academy is located at Leghorn (Livorno). The instruction is in two parts: (a) the normal course, and (b) the superior course. The limits of age at admission are thirteen and fifteen years. The normal course is five years in length, the theoretical instruction continuing during eight months of each year and the practical work on board the practice ships about three months. At the end of the course, having passed all examinations, the cadets are appointed midshipmen. They then are sent aboard cruising vessels for at least a year, after which they are commissioned as sublieutenants and are sent to the academy for the superior course of instruction, which comprises two sessions. The first session is obligatory for all sublieutenants, and the examination which takes place at the end fixes the rank of the officers in their grade and affects greatly the question of their advancement by selection (one-third are promoted to lieutenants by selection and two-thirds by seniority). To the second session only those are admitted who have attained a certain standard in their examinations, and these more fortunate young men receive a diploma which has an important influence upon their naval career and their eventual promotion. The naval constructors, constructing engineers, and commissary officers are also graduates of the naval academy. The schools for the enlisted men are five in number. There are also training ships for seamen.

Officers are supplied to the *Japanese* fleet in four ways: first, from the naval academy at Kure; second, by cadets sent to foreign naval schools; third, by promotion from the ranks (rare); fourth, by appointment from the marine school for merchant masters at Tokio. There are also torpedo, engineering, and gunnery schools, and several training ships for seamen and boys.

The naval school for the *Dutch* navy is located at Willemsoord. The age at entrance is fourteen to seventeen years and the course is four years. At the end of the course of four years the cadets pass examinations and are appointed as cadets of the first class. After two years' service in ships of the navy they are again examined, and, if found qualified, commissioned as second lieutenants. The school for naval engineers is at Hellevoets-

luis. There are also gunnery and torpedo schools and school-ships for training seamen and boys.

The *Norwegian* naval school furnishes not only the officers of the regular service, but also those of the reserve. Candidates for admission to the school must not be over nineteen years of age and must have served for twenty-one months in the merchant marine. The course at the school is in two parts, inferior and superior. The inferior course is three years long and at the end the cadets become ensigns. Those ensigns who are not destined to form part of the regular navy are, after two years of ordinary service, made lieutenants of the reserve. The superior course has two terms of eight months each. After eighteen months of additional service the graduates of the superior school are promoted to the rank of lieutenant. There are also gunnery and torpedo schools and training ships for the enlisted force.

The naval school of *Portugal* is a polytechnic institution. The course for executive officers consists of three months on a training vessel, one year at the naval school, three months on the training vessel again, and lastly, another year at the school. The graduates are then appointed midshipmen, and after two years of service are commissioned as ensigns. There are gunnery and torpedo schools for both officers and men and training-school ships for boys.

The principal source of supply of officers for the *Russian* navy is the naval academy at Saint Petersburg. The candidates for entry must be between fourteen and eighteen years of age. The course is four years. At the conclusion of the course the cadets become midshipmen. There is also at the academy a post-graduate course for instruction of officers in strategy, tactics, international law, etc. The other source of supply of officers is the school of navigation and ordnance at Kronstadt. The course is four years and the instruction similar to that given at the naval academy. There are also training schools for the enlisted men with several training ships.

The executive officers in the *Spanish* navy are graduates of the royal naval school. The age of candidates at entrance is from thirteen to eighteen years. The course is three years, after which the cadets become midshipmen, and then serve one year on board a ship detailed as the school of application, one year on board the sailing vessel *Nautilus*, and one year on vessels in service. After a final examination they are commissioned as sublieutenants. There are also floating gunnery and torpedo schools and vessels for the training of seamen and of boys.

The executive officers of the active list of the *Swedish* navy are graduates of the naval academy at Stockholm. The limits of age of candidates at entrance are thirteen and sixteen years. The course at the naval academy is six years (eight months in each year at the school and four months on a practice ship). Upon graduation the cadets are made sublieutenants. They are then sent for six months as instructors in a school (*Öfvercisskolan*), where the enlisted men receive their naval instruction. This is followed by six months' service of various kinds, including some time spent at the dockyard. They then spend terms with the mobile defense of the coast and the gunnery school, and after eight or nine months in cruising ships they are commissioned as ensigns. There are also schools of the mobile

defense, and a school for enlisted men (*Exercisskolan*) already mentioned, and a gunnery school.

In the Turkish navy the course of instruction is supposed to last ten years; four years at the primary school of Kassimpasha, four years in the preparatory school on the island of Halki, and two years at the naval school proper, also on the island of Halki. From the naval school the cadets graduate with the rank of lieutenant (*mulasim*).

Consult: the *Proceedings of the United States Naval Institute* (Annapolis); *Journal of the Royal United Service Institution* (particularly the number for October, 1901) (London); *Brassey's Naval Annual* (Portsmouth, 1886 et seq.); *Annual Reports of the Office of Naval Intelligence* (particularly the volume for 1888) (Washington); Soley, *Foreign Systems of Naval Education* (United States Navy Department, Washington, 1880); Buchard, *Marines étrangères* (Paris, 1891). See NAVAL ACADEMY; CADET, NAVAL; NAVIES; and section on *Naval Apprentices* under APPRENTICE.

NAVAL SIGNALS. See SIGNALS, MARINE.

NAVAL TACTICS. See TACTICS, NAVAL.

NAVAL VETERANS, NATIONAL ASSOCIATION OF. A patriotic society organized in New York City in January, 1887, having for its chief purpose the preservation of the traditions and memories of the United States Navy during the Civil War. It admits to membership any officer, appointed or enlisted man who served in the United States Navy, United States Marine Corps, or United States Revenue Marine Service during any portion of the time between April 12, 1861, and August 25, 1865, and who has been honorably discharged or resigned by an honorable acceptance of resignation. The organization is divided into thirty-nine local associations, and has a membership of nearly 10,000.

NAVAL WAR COLLEGE. See NAVAL SCHOOLS OF INSTRUCTION.

NAVARINO, ná'vá-ré'nó. A town of Greece, in the Morea and in the Nomarchy of Messenia, at the southern extremity of the Bay of Navarino. It is at present officially called *Pylos*. The ancient *Pylos* was at the northern extremity of the bay, and is now called *Palæokastro* and *Palæo-Navarino*. Population, about 3000. Along the front of the bay stretches the island of Sphagia, or Sphacteria (q.v.). In 1492 the Turks captured Navarino, and held it, with two or three short periods of interruption, till 1821, when it passed into the hands of the Greeks. In 1825 it was taken by Ibrahim Pasha, and on October 20, 1827, in the Bay of Navarino, the allied British, French, and Russian fleets, numbering twenty-four ships and commanded by the British Admiral Sir Edward Codrington, defeated the combined Turkish and Egyptian fleets, comprising eighty-nine ships of war. In this battle sixty of the Ottoman ships were destroyed outright, and the rest were driven ashore in a shattered condition. The Turks lost 8000 men, while less than 200 of the allies were killed. The battle of Navarino brought about the achievement of Greek independence. Consult *Memoir of Sir Edward Codrington*, by his daughter (1873).

NAVARRÉ, ná'vár'. A former independent kingdom on both sides of the western Pyrenees,

now constituting the Spanish Province of Navarra (capital Pamplona), and part of the French Department of Basses-Pyrénées. The Province of Navarre has an area of about 4050 square miles. A large portion consists of wooded mountains and well-watered valleys. The region about Pamplona is a treeless plateau. In the south, in the valley of the Ebro, is a fruitful district, called the Ribera (shore). In the south-east is a barren salt steppe. The region is drained by the Ebro, its affluents, the Ega and Aragon, the Arga, an affluent of the Aragon, and the Bidasoa. The population of the province is about 300,000.

HISTORY. This territory was occupied in ancient-times by the *Vascones*, the present stock of the Basques, and they were never entirely subjugated by the Romans. The Visigoths met with sturdy resistance from the Basques, and had to content themselves with a nominal overlordship. The Basques were enabled to maintain some independence even during the Saracen conquest. Charles the Great, toward the close of the eighth century, conquered their country and made it a part of the Spanish mark. It soon became independent of the Franks and for a time its history is very imperfectly known. Apparently Sancho Garcia (905-925), who wrested the region of the Upper Ebro from the Saracens, was the first to bear the title of King of Navarre. In the form of government the Basque influence and the tribal feelings were strong, and the governmental institutions were primitive. The King was elected, and limited in his power by a council of twelve nobles. The kingdom developed rapidly by conquests. Sancho III., the Great, who died in 1035, was also King of Castile, and Aragon was under his control as a dependency of Navarre. He divided his kingdom among his three sons. Sancho IV. of Navarre was murdered in 1076 and the nobles chose King Sancho of Aragon as their ruler. Until 1134 Navarre was united with Aragon (q.v.). In that year the King of Aragon, Alfonso the Battler, bequeathed his kingdoms to the Templars and Hospitalers. The people of Navarre, dissatisfied, chose the son of Sancho IV. as King and recovered their independence. The country continued under this dynasty for a hundred years, but Navarre, shut in by Castile and Aragon, was prevented from developing by conquests from the Moors. In 1234 Navarre passed by inheritance to Champagne. Queen Joanna of Navarre married Philip IV. of France in 1284, and from that time until the extinction of the Capetian dynasty, in 1328, the history of Navarre was intimately connected with that country. Then the kingdom went, as a dowry, to Philip of Evreux, who married Joanna, daughter of Louis X. Her son was Charles the Bad. (See CHARLES II. OF NAVARRÉ.) His grand-daughter Blanche married King John of Aragon, and Navarre was connected with Aragon from 1458 until 1479. John's daughter, Eleanor, who succeeded to the throne of Navarre in 1479, was married to Gaston de Foix, Viscount of Béarn, and thus Béarn was united with Navarre. Eleanor died soon after her accession and was succeeded by Francis Phœbus. His successor, Catharine de Foix, married in 1484 a French noble, Jean d'Albret. In 1512 Ferdinand of Aragon conquered what is now the Spanish portion of Navarre. The kingdom was thus reduced to a small district, to the north of the Pyrenees. Jeanne

d'Albret married in 1548 Antoine de Bourbon. Their son, Henry, ascended the throne of Navarre in 1572, and in 1589 became King of France as Henry IV. Navarre was united to France by decree in 1607, but down through Charles X. all French kings bore also the title of King of Navarre. Consult Bordenave, *Histoire de Béarn et Navarre* (Paris, 1873).

NAVARETE, ná-vá-rá'tá, DOMINGO FERNANDEZ (1610-89). A Spanish missionary. He was born at Peñañel, Old Castile; entered the Dominican Order, and in 1647 went to the Philippine Islands, where he became professor of theology at Manila. Later he made a missionary journey into the interior of China and resided there for a number of years, becoming in time the head of his Order in China. During a persecution he was imprisoned at Canton, but escaped and reached home in 1673. In 1677 he became Archbishop of Santo Domingo. He published the first volume of his work, *Tratados históricos, políticos, éticos y religiosos de la monarquía de China* (1676); but the second volume was suppressed by the Inquisition. A projected third volume was never published. Consult Navarrete's China, in *Churchill's Collection of Voyages and Travels*, vol. i. (London, 1744).

NAVARETE, FRANCISCO MANUEL DE (1768-1809). A Mexican poet, born at Zamora. He entered the Franciscan Order and ultimately became professor of Latin at the University of Valladolid. He attained some reputation, especially for his bucolic poetry. A collection of some of his works was printed as *Entretamientos poéticos del P. Navarrete* (1823).

NAVARETE, JUAN FERNANDEZ, properly FERNANDEZ-NAVARETE (c.1526-79), surnamed El Mudo (the Mute). A Spanish biblical painter, born at Longroño. He studied in different parts of Italy, especially at Venice under Titian, and returned to Spain after twenty years, with his reputation well established. In 1568 he was made painter to the King, and employed on the decorations for the Escorial. Among those still surviving are a "Saint Jerome," "Christ at the Pillar," "The Nativity," "The Martyrdom of Saint James," and a "Holy Family." In 1576 he painted his most famous picture, "Abraham and the Three Angels," for the Escorial, and in 1577-78 he further painted eight pictures representing the "Apostles," the "Evangelists," "Saint Paul," and "Saint Barnabas." Among his other works are "Saint John in Prison," Hermitage, Saint Petersburg, and "The Holy Family," Weimar Museum. Navarrete's manner shows the influence of his master, Titian, and he plays an important part in the technical development of the Spanish school. He died at Toledo, March 28, 1579.

NAVARETE, MARTIN FERNANDEZ DE (1765-1844). A Spanish navigator and author, born at Avalos, Logroño, Spain. He entered the Spanish navy in 1781, served in the West Indies and in the Mediterranean, and took part in the combined French and Spanish attack on Gibraltar in 1782. He became a lieutenant in 1789, and, having already attracted attention by his writings on naval questions, was commissioned to collect documents relating to the history of the Spanish navy. From 1796 to 1806 he was detailed on special service in the Department of Marine, resigning in the latter year rather than

recognize Joseph Bonaparte. He again took office after the restoration, became a recognized authority on naval affairs, and in 1823 was appointed director of the hydrographic office. Subsequently he was chosen Senator and made a Councilor of State. His greatest work was his *Colección de los viajes y descubrimientos que hicieron por mar los españoles desde fines del siglo XV*. (7 vols., 1825-65). He also wrote a *Life of Cervantes*, published with a new edition of *Don Quixote* (1820); and left material for two posthumous works, *Disertación sobre la historia de la náutica* (1846) and *Biblioteca marítima española* (1851).

NAVAREO, MADAM. See ANDERSON, MARY ANTOINETTE.

NAVARRO, ná-vá-ró, PEDRO (1446-1528). A Spanish general, who greatly developed the use of mines in war. His early life is obscure. In 1500 he was employed by Gonsalvo de Córdoba in the campaign against Naples. He was very successful in his use of mines against the famous Castello Nuovo in 1503, and was made Count of Alvetto by Ferdinand of Aragon. Navarro joined the French army after the battle of Ravenna (1512), and contributed largely to the success of the campaign of Marignano (1515). In Lautrec's disastrous campaign against Naples, Navarro was captured, taken to that city and imprisoned there. His death followed immediately.

NAVAS DE TOLOSA, ná-vás dá tò-ló'sá, LAS. A village of Andalusia, Spain, 37 miles north of Jaén, noteworthy as the scene of a battle (July 16, 1212) between Alfonso VIII. of Castile, aided by a large army of Crusaders, chiefly French and English, and an army of Moors under Mohammed ibn Abdallah. The Christians were victorious and permanently broke the Mohammedan power in Spain. Here also, in 1812, a battle took place between the Spanish and French.

NAVE (ML. *navis*, nave of a church, ship, Lat. *navis*, ship). A term used most commonly in connection with church architecture, and with two meanings. In the first place it denotes the higher middle division where there are three or five divisions; as in a church of the type established in the fifth century in the Christian basilicas of Italy. The side divisions are called aisles, and nearly all large Christian churches have had 'three aisles;' the word aisle in this case covering nave as well. A few large buildings are five-aisled, and the Cathedral of Antwerp is a seven-aisled church, but the nave is nearly always the middle and much the broadest and highest part. There are some churches, especially of the later Gothic period, which have aisles and nave of the same height; such are the cathedrals of Carcassonne and Erfurt, and of Vienna in Austria; but the central division remains the widest and is still the nave. In the ordinary form of church, where the nave is much higher than the aisle, the uppermost part of it is called the clearstory, and the large windows in the clearstory walls transmit much the largest amount of daylight to the interior.

The same use of the term for the middle and widest and highest division exists in the description of a Roman basilica, or bath establishment (thermæ; see BATH), or any building which is lighted in part by windows in the wall of a higher division rising above the roofs of the

lower divisions; thus it is disputed whether the middle part of the Ulpian basilica at Rome was roofed, and was a real nave, or open to the sky like a court.

The original meaning of the word was, however, different. It applied to all that part of a church which was farthest from the sanctuary, that is, that part into which the people entered from out of doors, excluding, however, the narthex or porch. For convenience, and because the majority of Christian churches in the West are oriented (see **ORIENTATION**), this may be called the Western part.

In the churches of the basilica type, then, all to the east of the great transept was the nave; and this use of the term continues. Thus, if we are speaking of a cruciform church, we speak of the eastern part as the choir; the middle part, which has its greatest length athwart the main lines of the church, we call the transept, and all west of the transept (except porch or tower) is the nave. In this sense, the nave includes the middle division and the side divisions, and we are compelled to say of the cathedral of Le Mans, for instance, that the nave consists of a nave and two aisles, while the choir has a nave and four aisles. These are difficulties only to be overcome by the use of explanatory phrases.

NAVESINK (nāv'e-sīpk) **HIGHLANDS.**

A chain of hills forming a bold headland inside of Sandy Hook, in Monmouth County, New Jersey (Map: New Jersey, D 3). They are important landmarks to ships approaching New York. On them are located two first-class light-houses, fifty-three feet high, both of which show fixed white lights. The adjacent region, which is very beautiful and easily accessible from New York City, attracts many visitors.

NAVEZ, nāv'vā, FRANÇOIS (1787-1869). A Belgian biblical and genre painter. He was born at Charleroi, November 16, 1787, and first studied under Isidore and Joseph François. He was a pupil of the Academies of Brussels and Ghent, and studied with David, in whose manner his works are executed. From 1817 to 1822 Navez was at Rome, after which he settled permanently in Belgium. He was made director of the Brussels Academy, and died at Brussels, October 12, 1869. Among his best works are the "Nymph Salmacis and Hermaphroditus" (1829), Ghent Museum; "Elijah Raising the Shunamite's Son" (1821), and the "Meeting of Isaac and Rebecca" (1826), Haarlem Pavilion; "The Holy Family" (1851), Antwerp Museum; "The Spinning Women of Fondi" (1845), New Pinakothek, Munich; and "Hagar and Ishmael in the Desert," Brussels Museum.

NAVICULAR DISEASE (Lat. *navicularia*, relating to ships, from *navicula*, diminutive of *navis*, ship). A disease of the horse, consisting in strain of the strong flexor tendon of the foot, at the point within the hollow of the fetlock where it passes over the navicular bone. It is most common among the lighter breeds of horses, and especially where the pasterns are upright, toes outturned, and work is early and severe on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or pointing of the affected limb while standing. Give rest, remove the shoe, shorten the toe, and apply hot poultices, changed

every few hours. Laxative medicine and bran mash may be ordered. After a few days, and when the heat and tenderness abate, cold applications should be given; after another week the animal may be placed for two months in a grass field, where the ground is soft and moist; or, if sufficiently strong, at slow farm work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness, and hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required, for the animal, being insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse. See **HORSE**.

NAVIES (OF. *navie*, from Lat. *navia*, ship, variant of *navis*, Gk. *naûs*, *naus*, Skt. *nāu*, Oicel. *nōr*, ship, *naust*, naval station; connected with Gk. *naîn*, *naîn*, to swim). The term navy is applied to the armed force of a country which operates on the water or in coast and harbor defense. The history of navies goes back to the earliest days of ships, for no sooner were such craft built than their value as weapons of war was at once seen. The Chinese were among the earliest of navigators, but little is known concerning their ancient fighting craft. The most ancient war vessels of which the details are known were those of the Egyptians, and the date assigned to them is B.C. 3000. At the same time it is evident that there were many other peoples that possessed fighting vessels, and that the Egyptians were far from paramount; for they had repeated naval combats with the Mysians, Phœceans, and Phœnicians, and probably also with the Pelasgians, Daunians, Oscans, Cretans, and Sicilians. It is therefore impossible to fix any sort of priority to the possession of naval defense. Herodotus says: "These Phœceans were the first of all the Greeks who undertook long voyages, and they are the people who discovered the Adriatic and Tyrrhenian seas, and Iberia and Tartessus (a part of modern Spain). They made their voyages in fifty-oared galleys and not in merchant ships." At this time, and for a long time subsequent and anterior, the shapes of merchant and war vessels were quite different, the former being broad and suitable for carrying cargo and the latter narrow and sharp so as to make speed. In addition, the war vessels were built with rams and other warlike appurtenances, while the merchant vessels made a much greater use of sails.

The command of the sea, so far as the Mediterranean was concerned, finally passed to the Phœnicians. Of their cities, Tyre soon took the lead in wealth and power, reaching its zenith about B.C. 1000, when the expression 'a Tyrian sea' became "a proverbial expression for a sea whose navigation was prohibited to all but those who claimed the ownership thereof." After a more or less complete naval supremacy lasting many centuries the power of the Phœnicians began to wane through the repeated assaults of the Assyrians, who attacked Phœnicia by land. Notwithstanding great numerical inferiority, the Phœnicians managed, though defeated, to preserve their independence, though in 870 they were compelled to pay tribute. In 724-720 Tyre was captured, but not destroyed, and in 650 the Tyrians threw off the foreign yoke. But the de-

vastating wars of the past two hundred years had so reduced the population that soon after their reassertion of independence their slaves rose and mastered the city. Very soon after this the Egyptians made themselves masters of Phœnicia, but in 805 the Chaldeans drove them out. The naval power of the Phœnician fatherland had now become of little importance, but her colonies were wealthy and flourishing. In the sixth century Carthage declared its independence, and though it never attained the masterful position of the parent State, for a century or more it was, upon the water, the most powerful of the Mediterranean States.

The decline of the Phœnician naval power permitted the rise of that of the Greeks and Persians. The confederated Greek fleets completely defeated the Persians at Salamis (B.C. 480). The naval supremacy of Athens was destroyed in the Peloponnesian War (B.C. 431-404).

The Romans found it necessary to build a war fleet when they came in conflict with the power of Carthage. Their first success was the defeat of the Carthaginian fleet at Mylæ (B.C. 260). With the fall of Carthage the naval power of Rome became paramount in the Mediterranean. Finally the battle of Actium (B.C. 31) cut off the last opposing naval force in the Mediterranean, that of Egypt.

Early in the Middle Ages the countries about the Baltic and North seas, which had been sending out their rovers in every direction, began to develop organized naval power. The predatory expeditions of the Norsemen show organized power, though the actual warfare was mostly upon land. The songs and stories of the Scandinavians and Danes contain many accounts of sea fighting, but the accounts are so intermixed with fable and poetic imagery that it is hard to separate fact from fiction. It is not until the ninth or tenth century that we begin to reach anything approaching reliable history. The first great sea fight of which we have a full account is that between King Olaf Trygvasson of Norway and the allied Powers of Denmark and Vendland, which were assisted by the Norwegians of the Province of Viken (from which the name of Viking is derived). Notwithstanding his brave and able defensive fight, Olaf was overcome by weight of numbers, defeated, and killed. This was in the year 1000. In 1014 Olaf the Saint assisted the Saxons to capture London, which was occupied by the Danes. This fight is interesting from the fact that it was won by a fleet fighting against land forces. The culmination of the naval power of Norway was reached soon afterwards under Harald Hardrada. About five years before the landing of William the Conqueror in England, Harald destroyed the Danish fleet in a fiercely fought action at Nisaa. In 1066 he started with a fleet and army to assist Earl Tostig, brother of Harold of England, who was in rebellion and had fled to Norway. The ambition of the Norwegian King in this instance caused his death, for he was killed in battle at Stamford Bridge, September 25, 1066—three days before the landing of the Normans and less than three weeks before the battle of Hastings. After the death of Harald Hardrada the Norse sea power declined.

When, after the fall of Rome, there ceased to be any dominant power in the Mediterranean, there was an increase of piracy and robbery on

the sea and along unprotected coasts. The geographical position of Italy caused it to be the natural doorway to merchandise entering Europe from the East or moving in the opposite direction. The development of maritime trade thus brought about caused the Italian commercial cities to be the heaviest losers by piracy, and made it necessary for them to establish naval forces. Of the Italian States, Venice, Pisa, and Genoa took the lead in commerce, and all gradually developed powerful navies. The army of Venice was composed chiefly of mercenaries and commanded by one because it was feared that a native might use its power to overturn the Government; but the navy, from which nothing of the kind was feared, became the pride of the people. The Senate encouraged the nobles to trade and serve in the fleet and they became merchants and admirals.

In the ninth century the Saracens had become powerful and troublesome in the Mediterranean, where their piratical armed vessels and strong fleets were the terror of every merchant who had a venture on the sea. They carried their depredations to the coast of Italy, so that in 842 the Venetians coöperated with the Greeks in sending a naval expedition against them. The hostile fleets met at Cortona. The Greeks fled at the first attack of the enemy, but the Venetians fought against vastly superior numbers until their loss was so great as to make further resistance impossible, when the few survivors endeavored to make their escape. For a quarter of a century the humiliation of defeat ranked in the Venetians, and finally they sent out a new force which gained a decisive victory over their enemies on the same spot. During the next six or seven centuries the Pisans, Genoese, and Venetians strove for naval and commercial supremacy with each other and with the Saracens and their natural successors, the Turks. Genoa and Venice profited by the Crusades, furnishing ships, munitions of war, and provisions to the Crusaders. Pisa succumbed to Genoa in the great sea fight off Meloria in 1284. Previous to this Genoa and Venice had entered upon their great struggle for supremacy. Both republics extended their territories by land and sea, and Venice held most of hers until the rise of the Turkish Empire, when she lost many of her islands and seaports, which constituted an almost uninterrupted territory from the head of the Adriatic to Asia Minor and the Bosphorus, including Cyprus, Crete, and the Morea. The contest between Venice and Genoa for control of the Mediterranean continued at intervals until 1380, when the Genoese fleet and army which had threatened Venice were captured at Chioggia by the Venetians under Admiral Vettor Pisani, one of the greatest of naval commanders. After the battle of Chioggia the military and naval power of Genoa declined quite rapidly. Venice, on the contrary, continued to grow in wealth, power, and extent of territory until at the close of the Middle Ages the Turks became dominant in the eastern Mediterranean, while at the same time the Republic had to withstand the combined arms of the covetous Christian powers.

The Turks, who had firmly established themselves in Europe, dreamed of universal conquest and were expanding their territory at every opportunity. At last in 1571 Venice, Philip II. of Spain, and Pope Pius V. united in a

great effort to put an end to the aggressive naval power of the Moslems, and the combined fleet, under Don John of Austria, dealt an irreparable blow to Turkish prestige in the battle of Lepanto. This victory did not arrest the decline of Venice, whose commercial prosperity was greatly affected by the change in the channels of trade which had been brought about by the discovery in 1497-98 of the water route to India.

Spain made a strong effort to become a great maritime nation, but ultimately failed, partly from governmental mismanagement, partly from various causes connected with the temperament of her people or with the country's environment. In 1588 she sustained a crushing blow in the defeat of the Invincible Armada, which was to conquer England.

Though the fact was not yet recognized, Neptune's sceptre was passing to northern nations, the English and the Dutch. But good sailors as the Dutch were, they were too few in number and too poor long to cope with their great rival, and Britain became mistress of the waves. Alfred the Great is commonly regarded as the founder of the British navy. Before his time the various petty kings had naval forces, but Alfred combined them into an English fleet and took command of it against the Danes in person, and England's first naval victory was gained in his reign off the coast of Essex. Alfred's grandson Athelstan fostered the maritime spirit of his people as regards both commerce and naval affairs. He granted the title of 'thane' to any merchant who had made three voyages on the high seas in his own ship freighted at his own expense, though this was a title previously confined to men of noble rank and extensive landed possessions. Edwy the All Fair is said to have had large fleets, and under Canute the Great English maritime commerce assumed large dimensions. After the Normans had firmly established their rule they also encouraged the growth of shipping and provided for its defense. Henry II. and Richard Cœur de Lion are both known to have had strong naval forces, and under John it was decreed "that any ships of other nations, though at peace and in amity with England, should be made lawful prizes if they refused to strike to the royal flag." Such an arrogant assumption is not likely to have been made unless the power to carry it out existed, and we know that John's fleet gained a victory over the French in the harbor of Damme. During the century which followed a sort of piratical war existed between England and France and the coasts of both were ravaged by the freebooters on either side. At length, in 1340, the English fleet, commanded by Edward III. in person, won the great victory of Sluis, the French losing nearly their whole force of three hundred vessels and 20,000 men killed, wounded, and prisoners. According to Charnock, this was the first action in which beaked galleys were wholly laid aside and vessels propelled chiefly by sails relied upon. From this time there was no particular improvement in the British navy (except that heavy guns were placed on board ship) until the reign of Henry VIII., who gave great attention to the fleet, building several relatively very large vessels, of which by far the greatest was the *Henry Grace de Dieu*. She carried 72 guns and 700 men and her tonnage is variously stated at from 1000 to 1500.

Henry VIII. was the first sovereign in Europe

to establish a corps of officers for sea service only; and he did more for the navy than any preceding monarch, using improved models for his ships and employing many Italian shipwrights (then the best in the world) in their construction. He greatly increased the number of vessels and established the arsenals at Portsmouth, Woolwich, and Deptford. Edward VI. and Mary paid little attention to the fleet, but Elizabeth recognized its vital importance and increased the number of ships and their size, besides improving the condition of the officers and gathering vast quantities of naval stores. From her reign to the present day the British navy, though not without rivals, has never been equaled.

In this brief review of the history of ancient and mediæval navies only those are considered which have been of greatest importance in the different periods. This has excluded a very large number from mention except so far as their histories are bound up with the histories of others. The greatest apparent omission is in the case of France. Her navy has always been respectable and occasionally very powerful, but it has never been paramount, and its prestige suffered at different times from defeats brought about by governmental neglect and mismanagement. It has not been to France what that of Great Britain has been to the British Islands and Empire, an absolute necessity. Her fleet has been built up or neglected according to the prevailing policy of the Government.

Modern naval development may be said to have begun with the rapid increase in the size of ships which took place at the close of the fifteenth century (see GUNS, NAVAL); and mediæval history finally closed with the battle of Lepanto in 1571, the last great action in which rowing galleys played an important part. From this time the sail-propelled man-of-war was gradually improved until early in the nineteenth century, when sails began to give way to steam. During this period the British navy managed to retain its general supremacy, though the temporary rise of the Dutch naval power seriously threatened it; and for a few years Louis XIV. managed to maintain a French fleet which was superior to the British, and with which Admiral Tourville defeated the combined British and Dutch forces off Beachy Head (1690). Two years later the French fleet was destroyed at La Hogue by the allied British and Dutch. From this time forward the superiority of the British navy was undoubted. Though it lost many single-ship actions with the French and Americans, no foreign navy could stand before its full strength.

After the close of the Napoleonic wars the great naval Powers were Great Britain and France alone. In the second rank were Spain, Russia, the Netherlands, and Turkey. In the third were Austria, Denmark, the United States, the Two Sicilies, Sardinia, Portugal, and Prussia. In 1860 the conditions were much the same, except that the United States had risen to the second category, the Netherlands had sunk to the third, the Kingdom of Italy was forming, and that of the Two Sicilies tottering to its fall; while Greece, Brazil, Peru, and Chile had organized naval forces.

During the American Civil War the navy of the United States, whose history and present condition will be found fully treated under UNITED STATES, became greatly expanded, but from 1865

to 1881 it steadily declined, until it reached the point of almost absolute uselessness so far as the ships were concerned, and ceased to be a factor among the naval armaments of the Powers. In 1866 the North German Confederation took over the Prussian navy and made some additions; and the fleet again received some increase of strength in the decade following the formation of the German Empire. Italy began to develop a fleet as soon as the Kingdom was established, but the disastrous battle of Lissa in 1866 caused a temporary check, and it was not until 1872 that she adopted the building policy that in a dozen years brought her up into the first rank of naval Powers. Russia began to reconstruct her fleet after the close of the Crimean War and has pursued a steady and unwavering policy of naval increase from that date to the present. In 1881 the United States began to rebuild the navy, but it was not until 1890 that battleships of the first class were commenced. After completing four large armorclads in 1878-80, Germany added little to her fleet until 1888-89, when a programme was adopted which included the construction of 28 ships of various types. Japan organized its navy on a modern footing soon after the close of the Civil War in the United States, and slowly added to it until after the battle of the Yalu (1894), when she began to build the fine vessels that have made her navy the most powerful outside of Europe, with the exception of that of the United States. Of the Powers of the second rank, Austria-Hungary is first. After the War of 1866 she did little for several years, and then (1872-78) built only three ships of much importance. In 1887 she launched two small armorclads, and in 1895-96 three coast defense vessels. Then was instituted a shipbuilding policy which, if persisted in, may soon place her among the great maritime Powers. Turkey, which had a powerful navy about 1880, has allowed it to fall into decay, and had not in 1903 a single ship of the first or even of the second class.

So far as the collective strength of their heavy fighting ships is concerned, navies are considered to rank as follows in 1903: 1, British; 2, French; 3, Russian; 4, United States; 5, German; 6, Italian; 7, Japanese; 8, Austrian. To the lesser Powers it is difficult to assign places. The relative positions of the United States and Germany are disputed, though all authorities agree that their forces are very nearly equal. At the opening of the twentieth century the French and Italian navies have been falling behind their rivals, and the Russian is hardly holding its own. If the present conditions remain unchanged, it seems likely that in a very few years the United States and Germany will be superior at sea to all other Powers except Great Britain, and will be striving with each other for second place.

The condition of the various navies in 1901-02 was as follows:

MODERN NAVIES.

ARGENTINA. The Argentine navy is the most powerful one possessed by a South American State. In May, 1902, the fleet consisted of 4 high-speed armored cruisers of 6840 to 7180 tons (launched 1895-98), 1 third-class battleship of 4267 tons (launched 1880, but recently rebuilt), 2 armored coast-defense vessels of 2336 tons (launched 1890-91), 2 armored coast-defense vessels of 1558 tons (launched 1874-75, but being re-

constructed), 3 high-speed protected cruisers of 3200, 3570, and 4780 tons (launched 1890-95), 1 small partially protected cruiser of 1442 tons (launched 1874), 2 torpedo gunboats of 1070 and 520 tons (launched 1890-93), 3 gun vessels of 550 to 820 tons, 1 cruising school-ship of 2750 tons (launched 1897), 1 torpedo school-ship of 1100 tons (launched 1880), 4 torpedo-boat destroyers of 280 tons, 2 torpedo boats of 110 tons, 6 of 85 tons, 4 of 52 tons, 10 of 16 tons, and 1 torpedo mining boat. In addition there were building in Europe two high-speed armored cruisers of 8500 tons, and in Buenos Ayres a submarine boat was reported as under construction. The former by a treaty signed in 1903 between Argentina and Chile were to be disposed of, while further disarmament was contemplated. The naval academy is located at Buenos Ayres. There is a small naval station at La Plata and a torpedo school and torpedo-boat station at Buenos Ayres, but the principal navy yard will be at Bahia Blanca when the works which were under construction in 1902 are completed.

AUSTRIA. The navy of Austria is in power of its fighting ships eighth in rank among the navies of the world and sixth among those in Europe. For many years no new vessels of importance were added to the fleet, but in 1893 the armored cruiser *Kaiserin Maria Theresia* was launched and three small battleships were commenced; and since that time the annual building programme has steadily increased. As reorganized in 1901 the Navy Department forms an autonomous section in the Ministry of War under the control of a vice-admiral, who is commander-in-chief of the fleet and marine forces, and who represents the Minister of War in the discussions of the budget of the Navy Department. The department consists of the marine cabinet, the general staff, and three administrative sections divided into eight bureaus. The naval budget for 1901-02 amounted to 46,690,820 crowns (\$9,478,236.46; 1 crown = \$0.203), an increase of 3,200,000 crowns on that for the previous year. The principal navy yard is at Pola (which is the headquarters of the fleet), but there is another at Trieste, and several small stations along the Dalmatian coast. The tabular statement later in this article gives the strength of the Austrian fleet.

BELGIUM. The seacoast of Belgium is only 42 miles long, and there are no very important seaports except the interior one of Antwerp. For fishery protection there is a small armed steamer of 684 tons, but there is no navy properly so called.

BRAZIL. Among the navies possessed by South American nations the navy of Brazil is third in power. The principal navy yard, together with the naval academy and apprentice school, is located at Rio de Janeiro, but there are other naval stations at Pernambuco, Santa Catalina, and Bahia. The fleet consists of 2 small battleships of 5700 and 4950 tons (launched 1883-85, but rebuilt in 1893-96), 2 new coast-defense armorclads of 3162 tons (launched 1898-99), 4 protected cruisers of 4537, 3450, 2750, and 1300 tons (launched 1890-96), 3 cruisers of 1414 to 1911 tons (launched 1877-90), 5 torpedo gun vessels of 500 to 1030 tons (launched 1892-98), 1 old monitor of 1000 tons, 6 small river monitors of 340 to 470 tons, 15 first-class torpedo boats,

7 second-class torpedo boats, 6 third-class torpedo boats, 2 submarine boats (Goubet type—Paris, 1895), 2 new submarines (projected), 6 armed merchant steamers, 16 small gunboats of 137 to 726 tons, 2 old armorclads of about 1500 tons used as floating batteries, 3 small transports, and several small vessels used for river service.

BULGARIA. The navy of Bulgaria consists of one small gunboat and four royal yachts; the personnel is variable and uncertain.

CHILE. Of the navies of South American countries, the navy of Chile is second in power, being exceeded only by that of Argentina. The naval school for officers is at Valparaiso. The principal dockyard is at Talcahuano, though there are naval stations at Valparaiso and Llica and smaller ones elsewhere. The fleet consists of 1 third-class battleship of 6900 tons (launched 1890), 1 fourth-class battleship of 3500 tons (launched 1874, but rearmed about 1890), 1 old monitor of 1870 tons (launched 1865), 2 high-speed armored cruisers of 7000 and 8500 tons (launched 1896-97), 1 protected cruiser of 4500 tons (building in 1902), 4 protected cruisers of 3600, 4420, 2080, and 2080 tons (launched 1890-96), 1 new steel-sheathed cruising training ship of 2500 tons (launched 1898), 3 torpedo gunboats of 750 to 860 tons (launched 1890-96), 4 torpedo-boat destroyers of 300 tons (launched 1896), 6 torpedo boats of 130 tons, 13 smaller torpedo boats, several small vessels and old gunboats, and a number of merchant steamers which are held at the disposal of the Government in case of war. In 1902-03 negotiations were concluded with Argentina by the terms of which the war vessels under construction in Europe were not to be added to the fleet, and the reduction in vessels and armament was provided for.

CHINA. The navy of China was never an organized force. The fleet was made up of squadrons supported, officered, and manned by different sections of the Empire, and the squadrons were called the Pe-chi-li squadron, Fu-chow squadron, and Canton squadron. The war with Japan swept away all the armored vessels and many of the unarmored ones and left the navy in a deplorable state, from which it has not yet recovered. There is not now, and there has not been at any time, any well-considered plan of supplying officers to the fleet, although there has been for many years a naval school at Nanking at which a few officers are educated by foreign instructors. What officialism and corruption failed to do in weakening the fleet, incompetency in the older officers accomplished. The principal dockyard is at Fu-chow, but there is a naval arsenal at Shanghai and small yards at Tien-tsin and Canton. The vessels possessed in 1902 in the different squadrons were 2 protected cruisers of 24 knots speed and 4300 tons (launched 1897-98), 5 protected cruisers of 2500 to 2950 tons (launched 1883-97), 3 cruisers of 2200 tons (launched 1883-90), 9 cruisers of 1200 to 2100 tons (launched 1875-87), 1 steel screw training ship of 1800 tons (launched 1895), 6 torpedo gun vessels of 850 to 1030 tons, 12 gunboats of 340 to 580 tons (launched 1869-95), 1 special service vessel (cruiser and cable ship) of 1400 tons, 1 armored gunboat of 200 tons (launched 1875), 6 small wooden floating batteries for river operations, 22 gunboats belonging to river and customs service of 120 to 850 tons, 4 dispatch vessels and training ships of 1200 to 1500 tons

(launched 1869-79), 3 armed transports, 1 sailing training vessel of 400 tons, and 21 torpedo boats of 27 to 120 tons (launched 1885-99). Four torpedo-boat destroyers built by Schichau in 1898-99 were captured by the allied forces at Taku in 1900 and added to the British, French, German, and Russian navies.

COLOMBIA. The navy of Colombia consists of 2 gunboats of about 400 tons, 2 armed yachts, 1 barque-rigged sailing vessel of 315 tons register, and 2 sailing cutters used in the revenue service.

COSTA RICA. The only war vessel possessed by Costa Rica is a small torpedo boat built by Yarrow in 1892.

DENMARK. Though necessarily small, the Danish navy has an excellent reputation as regards organization and efficiency. At the head of it is the Minister of Marine, who is assisted by a superior officer (usually a vice-admiral or rear-admiral) who has the title of 'director-general.' The Navy Department is divided into four principal sections: (1) Secretariat; (2) Admiralty; (3) Commissariat and Accounts; (4) Justice. The chief of the secretariat is the director-general; of the admiralty, a captain in the navy. The other two sections have civilian heads. The only dockyard is the royal arsenal, Copenhagen. The fleet consists of 2 armored vessels of 3470 tons (1 launched 1899, 1 building in 1902), 1 fourth-class battleship of 5370 tons (launched 1878, undergoing reconstruction), 6 armored vessels of 2080 to 3290 tons (launched 1868-96—older vessels rebuilt recently), 3 protected cruisers of 1290 tons (launched 1890-92), 2 protected cruisers of 2580 and 2900 tons (launched 1882-88), 4 small cruisers of 560 to 1570 tons (launched 1862-76), 6 gunboats of 215 to 360 tons, 4 surveying vessels of 95 to 145 tons, 1 torpedo mine boat of 389 tons, 1 royal yacht of 770 tons, about 20 special service vessels, receiving ships and hulks, 9 first-class torpedo boats of 90 to 143 tons, 4 second-class torpedo boats of 50 to 82 tons, 15 third-class torpedo boats of 15 to 44 tons.

ECUADOR. The navy of Ecuador consists of one small cruiser of 811 tons (launched 1885, repaired 1900), two iron steamers lightly armed, and one torpedo boat of about 85 tons.

EGYPT. Egypt has no navy, properly speaking. The armed vessels possessed by the Government are sixteen steam and sailing vessels of the coast guard service of 10 to 450 tons, three dispatch vessels of 330 to 700 tons, one transport of 3700 tons, thirteen shallow-draught river gunboats, and three royal yachts, which carry small guns.

FRANCE. The success of the French navy in war has never been proportional to its strength. This has been due to disorganizing forces from without the service which have prevented efficiency. Since the fall of the Empire the navy has greatly improved, and seems to be at present highly efficient; certainly, the ships, armaments, and equipments are of the best, and the personnel of apparently equal excellence. At present the French navy is second to that of Great Britain only, but for financial reasons the number of new ships now in hand and proposed is insufficient to enable France to maintain her present relative lead, and it is likely that within the next decade her navy will be surpassed by those of both Germany and the United States. It seems likely that the French naval authorities have realized the drift of naval matters for sev-

eral years, and that the special attention that has been paid to the development of submarine boats is due to the hope of obtaining a defensive naval weapon which, at little expense, would enable the French coasts to be adequately protected. The French Navy Department is presided over by a Minister of Marine, a civil officer who is a member of the governmental Cabinet. Until 1902 the executive head was the chief of the naval general staff, but this was changed, and the chiefs of bureaus are directly subordinate to the Minister of Marine, the chief of the staff sinking to the level of a bureau officer. The sections or bureaus of the department are: (a) General Staff; (b) Office of the Minister of Marine; (c) Personnel; (d) Material; (e) Ordnance; (f) Submarine Defenses; (g) Hydrography; (h) Central Control (financial inspection); (i) Accounts; (j) Pensions. There are in addition six consultation or advisory boards: (a) Superior Naval Council; (b) Board of General Inspectors; (c) Council of Works; (d) Commission on Equipment; (e) Commission on Machinery and Plant; (f) Board to Classify Officers for Promotion. The principal naval arsenals (see *ARSENAL*) are located at Cherbourg, Lorient, Brest, Rochefort, and Toulon, but there are others at Saigon (Cochin-China), Bizerta (Africa), Fort de France (West Indies), etc. By far the greater part of the executive officers are graduates of the Naval Academy at Brest, but many are now obtained from other schools, especially those promoted from the enlisted force. The men are enlisted voluntarily or drafted from the *conscription maritime*. The strength of the fleet is shown in the statistical table later in this article.

GERMANY. The navy of Germany is of comparatively recent origin. The Prussian navy and that of the North German Confederation were both weak. After the formation of the Empire a number of armored ships of importance were built, but it is only within the last dozen years that Germany began to take rank as a great naval power. From 1890 to the present the building of powerful new ships has proceeded steadily. After completing the vessels of several small building programmes, the Government in 1898 prepared a 'sexennate' programme, which was approved by the Reichstag. This provided for the construction of 7 new battleships, 2 armored cruisers, and 5 small cruisers, besides replacing vessels which had become antiquated. The bill laid down the principle that the life of a battleship and of a coast-defense ship should be considered as twenty-five years, that of a large cruiser as twenty years, and of a small cruiser as fifteen years; after which times the vessels are to be considered as antiquated and replaced. In 1900 a much more comprehensive law was passed. This provided that not later than 1916 the German fleet should consist of 38 battleships, 20 large cruisers, 45 small cruisers, and 16 divisions of torpedo boats. Should the finances of the Government permit, the programme will be completed earlier than 1916, and it now seems probable that this will be the case. In 1902 the Government also proposed to ask legislative authority to construct two battleships, five cruisers, and a torpedo division (six boats) in excess of the programme provisions. In 1899 the administration of the German navy was reorganized; all matters connected with

personnel, command of the fleet, mobilization, strategy, tactics, etc., were placed under the *Oberkommando*, and all matters connected with construction, dockyards, and matériel were put under the *Reichsmarineamt*. The *Oberkommando* was presided over by the commanding admiral of the navy, and the *Reichsmarineamt* by a vice-admiral acting as Naval Secretary of State under the Chancellor of the Empire. The two sections were wholly disconnected and were brought into harmony with each other by the Marine Cabinet acting advisory to the Emperor. In 1899 this organization was changed. The title of *Oberkommando* was changed to *Admiralstab*, and the office of *Oberkommandant*, or commanding officer of the navy, abolished. Additional authority was given the *Reichsmarineamt*, and the Emperor and his advisers in the Naval Cabinet exercised direct control of naval affairs.

The Imperial naval arsenals are at Kiel, Wilhelmshavn, and Danzig; the Naval School and Naval Academy are at Kiel. The composition of the fleet is given in the comparative tables further on.

GREAT BRITAIN. The British navy has been the most powerful navy in the world for three centuries, and it is to-day more than equal to the combined forces of any two Powers—probably equal to any four in actual warfare, as allied forces never can develop their full strength from lack of one supreme directing authority. The Naval Department is administered by the Board of Admiralty of six persons, consisting of the first lord, first sea lord, second sea lord, junior sea lord, controller, and civil lord. Theoretically, the members of the board are equal in authority; practically, the first lord is supreme. He has supervision over all departments, prepares the naval budget and programme, and is responsible to Parliament for the affairs of the navy; he is therefore necessarily a member of Parliament. The first sea lord (a flag officer) has charge of movements of the fleet, detail of executive officers, discipline, naval intelligence, deputy adjutant-general of marines, gunnery training establishments, naval reserves, hydrographic office, etc. The second sea lord (a flag officer) has charge of the intelligence department as far as it affects mobilization, manning the navy, training schools for boys, engineer officers, personnel of naval reserves, etc. The junior sea lord (usually a flag officer) has charge of transports, medical department, coal for the fleet, certain officers' allowances, chaplains, and naval instructors, and the intelligence department as regards mobilization so far as it affects the preceding. The controller (a flag officer) has charge of naval construction, dockyards, ordnance material, stores (except coal for fleet), and expense accounts. The civil lord has charge of naval works, general accounts, Greenwich Hospital, civil personnel. The first lord is assisted by the financial secretary and the permanent secretary. The former deals with all financial questions, assisted by the accountant-general and the director of navy contracts, the latter being also under the superintending lords as regards purchases made for their several departments. The financial secretary is a member of Parliament and of the party in power, and through him all Parliamentary statements are made in the House of Commons, unless the first lord be a member of that House. The permanent secretary superintends all correspondence in the

name of the board, prevents the various departments from acting independently, and provides for the due execution of orders.

The total personnel of the British navy on April 1, 1902, amounted to 118,025; it will be increased during 1902-03 to 122,500. The sum total of the naval budget for 1902-03 was £31,255,500.

The principal dockyards are at Bermuda, Cape of Good Hope, Chatham,* Devonport,* Esquimalt (British Columbia), Gibraltar, Halifax, N. S., Haulbowline (Cove of Cork), Hong Kong, Jamaica, Malta, Pembroke,* Portsmouth,* Sheerness,* Sydney. Of these, the ones marked with a star are first-class yards in all respects. Secondary yards and naval stations exist at Ascension Island, Bombay, Calcutta, Colombo, Dartmouth, Delagoa Bay, Deptford, Greenwich, Plymouth, Portland, Sydney, Trincomali, Wei-hai-wei, and London (West India Docks). Naval cadets of the line are educated at the Royal Naval School at Dartmouth. The Royal Naval College at Greenwich is for post-graduate courses. The engineering college is at Keyham, and there are engineering schools at all the principal dockyards. The gunnery and torpedo schools are both located at Portsmouth. (See NAVAL SCHOOLS or INSTRUCTION.) The strength of the British fleet is given in the table on a following page.

GREECE. The navy of Greece is naturally small, but it is by no means insignificant. The quality of its officers and men and their organization and training have never been tested by war, as practically no use was made of the fleet during the war with Turkey. In 1901 the Government decided to expend annually the sum of 2,500,000 drachmas (\$482,500) for the purpose of repairing and adding to the fleet. The fleet consists of 3 small battleships of 4885 tons (launched 1889-90, rebuilt 1897-1900), 1 old armorclad of 1774 tons (launched 1868, re-engined 1897), 4 small cruisers of 1000 to 1800 tons (launched 1879-85), 1 old school-ship of 1300 tons, 11 gunboats of 380 to 410 tons (launched 1859-84), 1 torpedo depot ship of 1100 tons, 1 old training ship of 2030 tons (launched 1869, re-engined 1897), 3 torpedo mining vessels, several smaller vessels of no particular military value, 31 torpedo boats of 18 to 85 tons (launched 1878-85), 2 old Nordenfeldt submarine boats, purchased in 1886 (probably useless), 20 torpedo vidette boats.

HAITI. The Haitian navy consists of one steel gunboat, 260 tons; one iron corvette, 1200 tons; two iron sloops of from 500 to 900 tons; and one gun vessel of 900 tons. The steel gunboat *Crête à Pierrot*, 940 tons, was sunk by the German gunboat *Panther*, as a punitive measure, September 7, 1902.

ITALY. The modern Italian navy dates from 1860, when the fleets of Sardinia and the Two Sicilies were combined. Immediately after the formation of the Italian Kingdom the construction of a powerful navy was commenced. The newly constructed fleet received a severe setback at Lissa in 1866, but it was continually added to, and in 1890, so far at least as ships were concerned, it was the third navy in the world. It then reached the limit of size permitted by the national finances. Since 1890 it has preserved about the same strength of fleet, but the increases in the navies of the United States, Russia, and Germany have forced Italy to sixth

place in naval rank. The head of the navy is the Minister of Marine (an admiral), who is assisted by the 'superior council' of the navy, composed of 1 vice-admiral (or admiral), president; 3 vice-admirals (or rear-admirals), 1 director-general of the civil personnel, members; 1 rear-admiral (or captain), who is a member and secretary; and lastly the chief of the bureau or office whose affairs are under consideration. By the law of November 23, 1889, the Navy Department is divided into 10 sections, as follows: (1) General Staff and Cabinet, which consists of (a) cabinet of the minister, which coördinates the different branches; (b) questions of a general military kind, strategy, and tactics, auxiliary fleet, defense of the coast, and fleet manœuvres; (c) rules and arrangements concerning the service, discipline, dress, etc. (2) Direction of the service as regards personnel. (3) Naval Construction. (4) Armament and Equipment. (5) Merchant Marine. (6) Hydrographic Service. (7) Medical Department. (8) Military Engineering (fortifications, works, etc.). (9) Office of Revision. (10) Accounts.

The Naval Academy and College is located at Leghorn. The principal dockyards are at Castellamare, Spezia, Venice, Taranto, and Naples; naval stations at Genoa, Messina, Licata, Cagliari, and Palermo. The Italian fleet as it existed in 1902 is summarized in the table given later in this article.

JAPAN. The modern Japanese navy may be said to have commenced with the purchase of the armored ram *Stonewall* (renamed *Adzuma*), which was built for the Confederate navy and sold to Japan at the close of the Civil War. Since then the strength of the navy has steadily increased, but it was not until 1894 that it began to take rank among the navies of the great Powers. In that year two large battleships were ordered, and during the next eight years four more battleships and six large armored cruisers were built. These accessions placed the Japanese navy in 1902 seventh among the naval forces of the world. The principal navy yards are at Yokosuka, Kure, Saseho, Onohara, and Nagasaki. The comparative tables show the strength of the fleet.

MEXICO. Until 1901 the navy of Mexico consisted of a small cruising training ship of 1200 tons (launched in 1891), and four gunboats of 425 to 450 tons (launched 1874-75). In 1901 a building programme was laid down providing for the construction of eight gunboats of 1000 tons and 16 knots, and two torpedo boats. Two of the gunboats in 1902 were nearly completed.

MOROCCO. The navy of Morocco consists of a small cruiser of 1200 tons (launched 1892) and one gunboat of 450 tons (launched 1898).

NETHERLANDS. In the days of sailing vessels the navy of the Netherlands was a powerful one, but the great cost of modern fighting ships has prevented the Netherlands, a naturally seafaring race, from maintaining a powerful fleet. The navy is represented in the Cabinet by the Minister of Marine. The administration, presided over by the Minister, consists of a chief (a captain) of the general staff, 1 director of naval construction, 1 director (commander) of the personnel, 1 director (captain) of pilotage, 1 director (captain) of the hydrographic service, 1 inspector of pay, provisions, and clothing, 1 medical inspector.

The executive officers are educated at the Royal Naval Academy at Willemsoord, while the engineers are educated at the special engineer school at Hellevoetsluis. The naval arsenals are four in number and located at Amsterdam, Hellevoetsluis, Willemsoord, and Fijenoord. There are small stations abroad in Surinam, Curaçao, Borneo, Sumatra, Java, and Celebes. The fleet consists of 3 small battleships of 4950 tons (building in 1902), 1 battleship of 5400 tons (launched 1874), 2 coast-defense ships of 3375 and 2490 tons (launched 1866 and 1891), 3 coast-defense ships of 3520 tons (launched 1894), 13 monitors of 1520 to 2200 tons (launched 1868-78), 5 armored river gunboats of 352 to 388 tons (launched 1870-79), 1 armored cruiser of 4600 tons (launched 1892), 6 protected cruisers of 3900 to 4033 tons (launched 1896-99), 3 cruisers of 3400 tons (launched 1876-82), 1 protected cruiser of 1703 tons (launched 1890), 64 gunboats of 175 to 1298 tons (launched 1874-1900), 5 surveying vessels of 300 to 800 tons, 42 special service vessels, receiving ships, school-ships, etc., 39 torpedo boats of 45 to 90 tons, 3 torpedo boats of 140 tons, 33 torpedo boats of 29 to 37 tons.

NORWAY. The navy of Norway is entirely separate from that of Sweden, though, of course, both fleets would be combined in case of war. With the possible exception of that of Sweden or Denmark, the Norwegian navy is the oldest in Europe. In proportion to its population, Norway has a greater mercantile marine and furnishes more mariners than any other country, but the great expense of modern fighting ships prevents the maintenance of a large naval force, or an attempt to do more than defend the coast. The government of the navy is confided to the commanding officer of the navy and the Minister of Marine and Posts. The last-named is an administrative office and constitutes the ministry proper; both branches have their headquarters at Christiania. The commanding officer of the navy is a rear-admiral, and he is assisted by a captain, while a second captain is stationed at Stockholm as naval aid to the King.

The executive officers of the active service and those of the reserve are educated at the royal naval school. Norway possesses but a single military port, that of Horten, near Christiania. There are five naval establishments, of which that of Karljohansvorn at Horten is the only shipbuilding yard; the others at Bergensund, Trondhjem, Fredriksvaern, and Christiansund are naval depots and supply stations. The fleet consists of four small battleships of 3400 to 3850 tons (launched 1896-99), 4 monitors of 1448 to 2000 tons (launched 1866-72—rebuilt 1895-98), 1 protected cruiser of 1113 tons (launched 1891), 1 cruiser of 1370 tons (launched 1896), 1 torpedo gun vessel of 380 tons (launched 1896), 2 wooden cruisers of 1006 and 1610 tons (launched 1862-80), 12 gunboats of 190 to 635 tons, several small gunboats, sailing training ships, etc., 10 torpedo boats of 90 tons (launched 1897-1901), 21 torpedo boats of 27 to 65 tons (launched 1882-1901), and 6 submarine boats (building in 1902).

PERSIA. The navy of Persia consists of an armed dispatch vessel of 1200 tons (launched 1885—remodeled from merchant steamer).

PERU. Previous to the war with Chile the Peruvian navy was of some importance, but a large sea-going monitor was captured by the

Chileans, an old monitor (purchased in the United States) was sunk, and an armored frigate was wrecked while chasing a Chilean gunboat. The naval force in 1902 consisted of a wooden cruiser of 1658 tons (purchased in France in 1900—launched 1877), 1 cruiser of 1700 tons (launched 1881—a sister to the U. S. S. *Topeka*), 1 gunboat of 420 tons (launched 1883), 1 small iron cruiser (launched 1891), 1 screw frigate (training ship), 1 armed transport of 1400 net tons measurement (launched 1863), and several paddle steamers.

PORTUGAL. From time to time plans have been made for increasing the strength of the Portuguese fleet, but aside from an occasional cruiser the financial resources of the country have been unable to meet the demands of the naval programme. The Navy Department forms part of the Ministry of the Marine and Colonies. It is presided over by a vice-admiral with the title of director-general, and consists of the divisions of (a) personnel and (b) material. The only naval arsenal is at Lisbon, where is also located the naval college, a sort of polytechnic institute in which all the officers of the navy are educated—even the medical officers having a final course there. The fleet consists of 1 old armored coast-defense ship of 2480 tons (launched 1875), 1 protected cruiser of 4280 tons (launched 1898), 2 protected cruisers of 1800 tons (launched 1898), 2 cruisers of 1660 and 1765 tons (launched 1896-99), 4 small cruisers of 1110 to 1429 tons (launched 1864-84), 21 gunboats of 160 to 729 tons (launched 1873-1902), 25 river gunboats of 34 to 300 tons (launched 1888-1902), 1 transport of 3000 tons, 3 training ships, a number of small craft, 1 armed royal yacht of 950 tons (launched 1899), and 11 torpedo boats of 31 to 60 tons (launched 1880-93).

RUMANIA. The Navy Department in Rumania is a branch of the Ministry of War. The officers hold military titles and are overshadowed by the army in every way. There is a naval school for the instruction of petty officers, but a military education is apparently sufficient for the higher officers. There is a small navy yard at Galatz at which gunboats are occasionally built. The fleet consists of 1 protected cruiser of 1325 tons (launched 1887), 4 gunboats of 104 to 400 tons (launched 1862-86), 1 armed yacht of 350 tons, 6 torpedo boats of 55 tons (launched 1888-95), 8 second-class torpedo boats and launches of 10 to 32 tons (launched 1882-95), and 12 gunboats and coastguard vessels of 45 to 110 tons (launched 1873-93).

RUSSIA. The Russian navy really dates from the time of Peter the Great, though the dwellers in the lands now belonging to Russia along the shores of the Baltic have been seafaring people from time immemorial. The navy and Navy Department are presided over by the general admiral, who is always one of the Imperial family. He has under his orders an Under-Secretary of State having the rank of vice-minister and called the director of the Ministry. The general admiral is assisted and advised by a board of admiralty consisting of 4 admirals, 5 vice (or rear) admirals, and 1 lieutenant-general of naval corps. The Minister of Marine or director of the Ministry is an admiral appointed by the Emperor. The subdivisions of the Ministry are: (1) General Staff; (2) Chief Naval Judicial Court; (3) Material and Supplies; (4) Technical Committee; (5) Scientific Committee; (6) Hydrographic

Bureau; (7) Medical Bureau; (8) Chancellerie; (9) Administration of Courts-Martial; (10) Archives.

The naval schools are the naval academy, at Saint Petersburg, naval college (higher course at the naval academy), school of navigation, ordnance, and naval construction at Kronstadt, and marine engineering school. The present plans are to combine all the schools in one establishment. The principal dockyards are the New Admiralty Works at Saint Petersburg, Galernaya Island Yard at Saint Petersburg, Kronstadt arsenal, Nicolayev dockyard, Sebastopol arsenal, Windau dockyard, Libau dockyard, Port Arthur (Liao-tung Peninsula), Vladivostok, Sveaborg, Revel, Archangel, Baku, Batum, Nicolayevsk (Amur), and Kagala (Oxus). The number and displacement of the vessels of the fleet are given in the table. The transport service between Russia and Eastern Siberia is carried on by the Russian Volunteer Fleet, which receives a large subsidy from the Russian Government. It consists of 18 steamers of 7650 to 12,000 tons (launched 1891-1900), and 1 of 2700 tons (launched 1895). The vessels of the Black Sea Steam Navigation Company, 12 in number, mostly of about 2400 tons, are fitted to receive armaments and act as auxiliary cruisers or transports in time of war.

SANTO DOMINGO. The naval force of this little republic consists of 1 small gunboat of 322 tons (launched 1894), 1 cruiser of 1000 tons (launched 1896), 1 cruiser of about 1000 tons (rebuilt in 1896-97).

SARAWAK. The navy of this little Bornean State consists of three small gunboats of 118 to 300 tons (launched 1875-84).

SIAM. The navy of Siam consists of 1 protected cruiser of 2500 tons, 8 gunboats of 260 to 800 tons, 1 old floating battery of 950 tons, 1 old depot ship of 545 tons, 6 dispatch vessels of 100 to 700 tons, 1 torpedo boat of 45 tons (launched 1888), and 43 small steamers for river and coast service.

SPAIN. The navy of Spain received a serious setback in the Spanish-American War, losing about half the fleet. During 1901 the navy was reorganized, and soon after it was proposed to construct a new and powerful fleet of 8 battleships of 12,000 tons, 4 cruisers of 8000 tons, and a limited number of smaller cruisers and torpedo vessels. All the old vessels not actually needed have been or are to be sold, the arsenals and naval establishments are being reorganized, and other improvements are contemplated. It is hoped by these means so to reduce the unnecessary expenses that a fine fleet can gradually be built and maintained without adding greatly to the expenses of the Government. The navy is presided over by a Minister of Marine, formerly a naval officer, but the incumbent in 1902 was a civil official. He is assisted by a council of 9 persons, of whom 5 are officers of the navy, 1 is a Senator, 1 a Deputy of the Cortes, 1 an inspector-general of engineers, and 1 a field marshal of artillery. The central administration consists of: (1) Section of Personnel; (2) Section of Equipment; (3) Section of Navigation and Maritime Industries; (4) Section of Naval Construction; (5) Section of Naval Ordnance; (6) Section of Accounts; (7) Section of Administrative Affairs. The reorganization of the navy in progress in 1902 may effect considerable changes in these arrangements. The principal dockyards

are located at Ferrol, Cadiz (La Carraca), Trubia (army gun-factory where naval guns are made), Bilbao, and Cartagena. There are, in addition, several naval stations and supply depots. The naval school is located on the old wooden frigate *Asturias*. All executive officers are required to pass through the school; the course is three years, after which the cadets serve as midshipmen for further instruction. The fleet in 1902 consisted of 1 battleship of 9900 tons (launched 1887—partly rebuilt 1897-98 and 1900-01), 2 old battleships of 7000 tons (launched 1863-65—rebuilt as armored cruisers 1897-98), 1 armored cruiser of 9090 tons (launched 1895), 3 armored cruisers of 7000 tons (launched 1896-1900), 1 protected cruiser of 5372 tons (building in 1902), 2 protected cruisers of 5000 tons (launched 1891-92), 2 protected cruisers of 1875 and 2030 tons (launched 1898-1900), 1 small protected cruiser of 1040 tons (launched 1890), 2 cruisers of 3090 and 3342 tons (launched 1879-87), 3 cruisers of 1152 tons (launched 1885-88), 10 torpedo gunboats of 570 to 830 tons (launched 1889-97), 1 torpedo-boat destroyer of 386 tons (launched 1886), 4 torpedo-boat destroyers of 370 to 400 tons (launched 1896-97), 1 armed yacht of 1800 tons (purchased 1898), 7 training ships of 800 to 4000 tons, 1 transport of 2000 tons, 42 gunboats of 37 to 525 tons (launched 1877-95), 16 torpedo boats of 65 to 108 tons (launched 1885-1901).

SWEDEN. The navy of Sweden has been very much increased during the last fifteen years, and now possesses many effective coast-defense ships. The navy is presided over by a Minister of Marine with headquarters at Stockholm; the Minister is either a naval officer or civilian. The department comprises four bureaus, viz.: (a) The Cabinet of the Minister; (b) The Bureau of Personnel; (c) The Naval Staff; (d) The Bureau of Material. The school for executive officers (there are no marine engineer officers in the navy) is located at Stockholm; the full course is six years.

There are two naval arsenals, one at Stockholm and one at Karlskrona. The fleet consists of 4 small battleships of 3650 tons (building in 1902), 7 small battleships of 3100 to 3450 tons (launched 1886-98), 4 single-turret monitors of 1500 to 1580 tons (launched 1865-75—reconstructed 1898-1902), 9 very small single-turret monitors of 240 to 460 tons (launched 1869-76—nearly all recently rebuilt), 3 cruisers of 1530 to 2000 tons (launched 1870-86), 7 torpedo gunboats of 670 tons (launched 1896-99), 15 gunboats of 190 to 640 tons (launched 1861-84), 12 miscellaneous vessels, 12 vessels of 170 to 2858 tons, used as school-ships, training ships, and floating barracks, 1 torpedo-boat destroyer of 320 tons (building in 1902), 5 torpedo boats of 44 to 85 tons (building), 15 torpedo boats of 60 to 85 tons (launched 1884-1900), and 13 second-class boats of 34 to 44 tons (launched 1882-1902).

TURKEY. The reduction of revenue entailed by the Turco-Russian War of 1877-78 caused Turkey to let her navy become wholly ineffective for purposes of war. About 1890 it was decided to rebuild some of the most available vessels of the fleet, and now all the old ships have either been rebuilt or are in process of reconstruction. The Navy Department, however, needs reconstruction more than the ships, for so long as present prac-

N. B.—Vessels launched before 1878, unless reconstructed and rearmed, are not included in these lists. Unprotected cruisers and gunboats do not include converted merchant vessels or yachts.

tices prevail the vessels will soon become useless for lack of care. The Minister of Marine is an admiral appointed by the Sultan. The department is divided into four bureaus, viz.: (1) Personnel; (2) Material; (3) Construction; (4) Medicine and Hygiene. The only great dockyard is the arsenal of Constantinople; this is a large and very excellent establishment as regards plan and arrangements, but is not properly kept up, and much of the machinery and fittings cannot be used. The personnel of the fleet consists of 6 vice-admirals and 11 rear-admirals with the rank of *pasha*; 130 captains, 25 commanders of superior grade, 55 commanders of inferior grade, 300 lieutenant-commanders—all with the rank of *bey*; 250 lieutenants, and 200 sub-lieutenants—with the rank of *effendi*; 400 engineers, 60 surgeons, 100 commissary officers, 110 pay officers. The enlisted force on paper is about 15,000 men; in fact, it rarely exceeds 3000, and sometimes is considerably less. For many years the larger vessels of the navy swung around their buoys in the Golden Horn without moving and without sufficient men on board to move them. The fleet consisted in 1902 of 1 battleship of 10,650 tons, which has been under construction at the arsenal of Constantinople for nearly ten years, and in 1902 was still far from being ready to launch; 7 old battleships of 5600 to 9120 tons (launched 1864-74, and very thoroughly rebuilt, modernized, and rearmed 1896-1902), 5 old battleships of 2050 to 2720 tons (launched 1868-72, but in 1902 undergoing thorough reconstruction), 1 armored coast-defense gunboat of 330 tons (launched 1864), 3 protected cruisers of 3250 tons (building in 1902 at Philadelphia, Elswick, and Kiel), 2 protected cruisers of 4050 tons (building at arsenal in Constantinople—work practically suspended for many years), 6 small cruisers of 643 to 1815 tons (launched 1892-96), 3 torpedo gunboats of 450 to 900 tons (launched 1890-92), 4 torpedo-boat destroyers of 180 to 270 tons (launched 1894-1900), 22 torpedo boats of 42 to 150 tons (launched 1884-92), 6 gunboats of 200 tons (2 completed 1894—others building), about 25 special service vessels.

UNITED STATES. The head of the Navy Department is the Secretary of the Navy, a civil officer, and a member of the Cabinet; and the Assistant Secretary is also a civil officer. The department is divided into eight bureaus, Navigation, Ordnance, Equipment, Construction and Repair, Steam Engineering, Yards and Docks, Supplies and Accounts, and Medicine and Surgery; and there is in addition the office of the Judge Advocate-General. The Bureau of Navigation has charge of the personnel and the direction of the fleet; the duties of the other bureaus are indicated by their titles. Under the Bureau of Navigation are the Office of Naval Intelligence and the Naval Academy; under the Bureau of Equipment are the Hydrographic Office, the Compass Office, the Naval Observatory, and the Nautical Almanac Office. The Board of Construction, which passes on the general features of new ships, is made up of the chiefs of the Bureaus of Navigation, Ordnance, Equipment, Construction and Repair, and Steam Engineering. Strategical and tactical matters are controlled by the General Board, which is similar to the general staff of foreign services.

For further and detailed information, see *Navy* in the article on the UNITED STATES.

URUGUAY. The navy of Uruguay consists of 3 small gunboats of 270 to 400 tons (launched 1883-91), 1 dispatch boat of 400 tons (launched 1882), and 1 transport of 260 tons. The senior officer has the rank of rear-admiral.

VENEZUELA. The navy of Venezuela previous to the difficulty of 1902-03 with the European Powers consisted of 2 armed steamers of 500 to 832 tons, a torpedo gunboat of 571 tons (launched 1891; purchased from Spain 1899), and several river gunboats (built in England 1891-93).

See ARMOR PLATE; SHIP, ARMORED, where will be found a complete bibliography; GUNS, NAVAL; GALLEY; SHIPBUILDING; TACTICS, NAVAL; TORPEDO BOAT.

NAVIGABLE RIVER. See RIVERS, NAVIGABLE.

NAVIGATION (Lat. *navigatio*, a sailing, from *navigare*, to sail, from *navis*, ship + *agere*, to lead). In a broad sense, all means whereby the ship is made to proceed from place to place, but in a more technical sense, only those means whereby the course of the vessel is directed or ascertained.

HISTORY OF NAVIGATION.

The early history of navigation is wrapped in obscurity. The Egyptians had vessels large enough to be called ships about 3000 years B.C., and perhaps long before this. The Chinese also built ships at a very early date. The appliances for navigating these vessels must have been few and rude, and a voyage of a few hundred miles was regarded as a great undertaking. Considering the difficulties under which they labored, the voyages of the Phœnicians must be regarded as daring ventures. They spread their merchant fleets throughout the Mediterranean, navigated Solomon's squadrons to the Persian Gulf and Indian Ocean, and planted colonies everywhere.

Principal among these colonies was Carthage. The Carthaginian fleets passed the Pillars of Hercules, and, with no better guide than the stars, are believed to have sailed northward to the British Isles, and southward for some distance along the west coast of Africa. In B.C. 611 a Phœnician expedition fitted out by Pharaoh Necho started to circumnavigate Africa, a feat which is said to have been actually accomplished. From the eighth to the fourth century B.C. the Greek States gradually developed the art of navigation, and at the time of the Peloponnesian War the Athenians appear to have been skillful tacticians, capable of concerted manœuvres. In the fourth century B.C. Alexander the Great destroyed the power of Tyre, transferring its commerce to Alexandria, which became the centre of trade for the ancient world. Rome wrested from Carthage its naval power, and took its vast trade into the hands of the Italian sailors.

During all this period the average size of the vessels had been continually increasing. Sails were known, and some knowledge was evinced even of beating up against a foul wind; but oars were the great motive power; speed was not thought of, a voyage from the Levant to Italy being the work of a season. During the time of the Roman Empire no great progress seems to have been made, except in the size of the vessels; but regular fleets were maintained, both in the

Mediterranean and on the Atlantic coast of Gaul, for the protection of commerce.

The barbarian nations of the North developed the art of navigation in their own way. The Saxons, Jutes, and Norsemen began to roam the ocean in every direction; in small vessels they trusted more to the winds than to oars, and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Norsemen extended their voyages to Iceland, Greenland, and Newfoundland, while they first ravaged and then colonized the coasts of Britain, France, and Sicily.

In the Middle Ages the Venetians, the Genoese, and the Pisans became the carriers of the Mediterranean Sea. Their merchants traded to the farthest Indies, and their markets became the exchanges for the produce of the world. Their constant rivalries gave occasion for the growth of naval tactics. So rich a commerce tempted piracy, and the Mohammedan corsairs spread over the Mediterranean, and, passing through the Straits of Gibraltar, ravaged the Atlantic coast.

The mariner's compass (q.v.) came into quite general use in the thirteenth century, and rendered the seaman independent of the sun and stars, so far as simple steering was concerned. The variation of the compass from true north seems to have been observed as early as 1269, but it was not until the voyages of Columbus that much attention was paid to it.

It was not until the thirteenth century that the employment of the mariner's compass brought about the development of practical nautical charts. (For ancient cartography, see GEOGRAPHY and MAP.) These first appeared in Italy; they were constructed by the aid of the compass and took the name of compass charts. The oldest of them is the so-called Pisan chart, which belongs probably to the middle of the thirteenth century, and it covers the whole of the Mediterranean. The earliest chart of which the exact date is known appears to be that of P. Visconte (1311). These charts are all plane, and together with other early ones are chiefly of the Mediterranean; but some of those appearing in the fourteenth century show the Azores, the Canaries, and the coast of Africa as far as Cape Bojador.

The translation and dissemination of Ptolemy's works in the fifteenth century caused a great improvement in maps and charts, and the subsequent labors of Copernicus and Mercator brought them to a very satisfactory state, considering the lack of geographical information. Mercator (1512-94) engraved an extensive atlas. Edward Wright, who published in 1599 a work entitled *Certain Errors in Navigation Detected and Corrected*, gives a complete exposition of the proper method of constructing a Mercator's projection, together with other information of value. In what is known as Mercator's projection, meridians are straight lines parallel to each other, and are crossed by the parallels of latitude at right angles. In order to preserve the proportion that exists in the curved surface of the earth and render the track of the ship (loxodromic curve) a straight line on the chart, the meridians are expanded or increased in length. The augmented latitudes are computed and published in a table of 'meridional parts' by means of which the parallels of latitude are placed. In Mercator charts of great extent the

areas of portions differing much in latitude are greatly out of proportion, but contiguous areas differing little in latitude compare fairly well.

The rude character of the early instruments used in navigation prevented close determination of a ship's position at sea. Watches were unknown until about 1530, when Gemma Frisius immediately recognized the possibility of using them for the purpose of ascertaining the difference of longitude between two places. These early timepieces were very defective, however, and it was not until 1765 that Harrison was awarded £10,000 by the British Government for his chronometer, a second £10,000 which he received being paid in 1773 after further trials of his invention.
